products' manufacturing, chemical production lead in Russia. In addition, the assessment for "green" investments in the regional aspect shows their extremely uneven placement on the Russian territory.
Fig. 4. Total "green" investment dynamics and "green" investment share in total fixed capital investment in Russia for the period 2000-2018.
Source: compiled by the authors, based on the data of Federal State Statistic Service of Russia

Figure 4 illustrates the total volume dynamics of "green" investments in Russia. We can see that the "green" investments in Russia occupy a fairly low share of investments into the fixed capital in contrast to European countries. This share has been constantly decreasing since 2000.

The movement towards sustainable economical development determines the need to evaluate certain countries' achievements in the field of "green" economy. It can be made by using various qualitative macro-indicators for creating environmental ratings and rankings. Today there are some indicators, the most informative from the point of view of the effectiveness into the "greening" economy implementation's process. They are: global index of innovation in environmentally friendly technologies; efficiency index action in the field of climate change; the index of environmental efficiency; environmental track; environmental vulnerability index; low-carbon economy index; environmental policy rigidity index; global green economy index (OECD 2018).

Russia took the 39th place in 2017 (see Table 2), the input and output of innovations was significantly lower than the average rate in the world, according to the countries' rating on the global index of innovations in the environmentally friendly technologies' field (GCII). According to the global index of innovation in the environmentally friendly technologies' field, Russia lacks a strong entrepreneurial culture and orderly structure for supporting the national innovation ecosystem. The country's weakness is in innovation drivers related to the environmentally friendly technologies. It is particularly evident in the regulatory system that Russia does not support innovation in the environmentally friendly technologies' field. There is the lack of specific industrial clusters in the environmentally friendly

technologies' field and the absence of any private local investors in environmentally friendly technologies. The lack of successful startups is in contrast to the small amount of venture capital funding in Russia. It indicates strong research in the field of clean technologies and intellectual property protection. There were 1,279 patents for technologies related to environmentally friendly technologies in 2013. It does not lead to any significant commercial clean technologies in Russia. The evidence is into the lack of activity in the clean technologies' field and investments (GCII). However, the country shows relative confidence in the energy sector.

Table 2. Ranking of countries on the global innovations' index in the environmentally friendly technologies' field in 2014 and in 2017.

2014			2017		
Ranking position	Country	Indicator value	Ranking position	Country	Indicator value
1	Israel	4,34	1	Denmark	4,07
2	Finland	4,04	2	Finland	3,96
3	USA	3,67	3	Sweden	3,86
4	Sweden	3,55	4	Canada	3,76
5	Denmark	3,45	5	USA	3,59
………….	………….	…………….	…………….	…………….	…………….
36	Mexico	1,15	36	Argentina	0,84
37	Poland	1,03	37	Bulgaria	0,83
38	Bulgaria	1,01	38	Saudi Arabia	0,67
39	Greece	0,97	**39**	**Russia**	**0,65**
40	**Russia**	**0,81**	40	Indonesia	0,60

Source: compiled by the authors, based on the data of Global Cleantech Innovation Index (GCII)

The Global green economy index (GGEI) is an important indicator of the effective "greening" process implementing by the countries. It was the first "green" economy index released in 2010. This index is now the most widely used product at the international level. It is used by the policy makers, international organizations, civil society and private sector. Like many indexes, GGEI is used to evaluate performance and to inform about areas that need improvement. It also demonstrates to various stakeholders how they can contribute to progress. The GGEI is particularly relevant in today's realities. It is due to the countries seeking to implement new emission reduction and sustainable development. They will need data to determine the best method to a low-carbon economy (see Fig. 5) (OECD 2018).

Fig. 5 illustrates the difference in the global green economy index (GGEI) in different countries in 2018. You can see that the leading positions belong to Sweden, Switzerland, Iceland and Norway, while Russia and Poland lag behind.
Fig. 5. Global green economy index (GGEI) in different countries in 2018
Source: compiled by the authors, based on the data of Global green economy index 2018

As noted above, only a few Russian companies currently participate in global initiatives into the field of sustainable development and green finance (Tarkhanova et al, 2020). A good example is the association of more than 50 participants in the Russian network of the UNO Global compact. It includes large companies, small and medium-sized businesses, business associations, public organizations and academic institutions from 16 Russian regions (Vnesheconombank, PJSC "Norilsk Nickel", PJSC "Severstal", JSC "RUSAL", PJSC "OC"Rosneft", PJSC "LUKOIL" and others). The UNO global compact network was launched in Russia in 2008. The UNO Global compact participants' activities are based on the concept of sustainable development. It combines three main areas: economic, social and environmental area. Several Russian companies on their information Internet portals declare the reports' preparation on the standards of sustainable development-GRI (Ministry of Finance of the Russian Federation 2017).

Vnesheconombank (VEB) is one of the leaders into the Russian financial market in the field of corporate social responsibility and sustainable development. Here is also Sberbank of Russia, Atomenergosbyt and other companies over the past years. Vnesheconombank (VEB) has significant capital investments in "green" investments. Vnesheconombank is the chairman and leader of the UNO global compact network since 2013. Today, Vnesheconombank considers a number of projects that belong to the "green" category. There are initiatives in the field of solar and wind energy, solid municipal wast's disposal and "smart" electric networks' creation. Vnesheconombank considers the green direction in its activities as a tool for improving export competitiveness. It is a platform for interaction with national and international development institutions. Special green finance tools are developed together with the Bank of Russia, the Moscow Exchange and market participants.

There is no doubt that in Russia, the importance of the "green" economy in general and of clean energy in particular will increase as in the rest of the world. According to certain estimates, in 2025, the global market for environmentally friendly equipment will reach 4.4 trillion euros (about $ 6 trillion). It will be more than 30% of average annual growth for the "green" economy and an increase in its contribution to

world GDP to 6-7%. Russia plans to use revolutionary technologies in the energy saving field, including new nanotechnology in order to reduce emissions of harmful substances. There is no doubt that the innovative model for Russian energy development and increasing the energy efficiency of the country's economy will become a strategic directions to the" green " model of the country's economic development. It is important to note the active development of renewable energy sources (RES) in Russia. There are solar and wind generation, small hydropower and biomass energy production. Moreover, the main strategic objectives for the "green" economy development in Russia will be: healthy environment; environmentally safe production; efficient environmental sector of the economy in the nearest future.

Conclusions

The conducted study of the "green" economy development in Russia has showed that the relative growth of the "green" investments was recorded in the period from 2000 to 2018. According to the indicators of "green" growth, Russia tries to maintain the priority of "green" investment. Russia remains significantly behind the leading countries of the world. A characteristic feature of the "green" investment system in Russia is noted. This feature is related to the structure of financing sources for "green" investments. In particular, the main financing is provided by the enterprises' own funds, rather than by the state and specialized manufacturers. This problem forms a key component of the further economy development. It is the adjustment for the current model of economic development with the mandatory participation for all interested parties. Today there are some key problems that hinder the development of "green" investment in Russia. They are: the lack of a legal framework for regulating "green" investment, a system of state support for "green" investments' attracting and a system for "green" securities' verifying. The presented considerations allow to conclude that in order to achieve the goal of creating a "green" economy in Russia, it is necessary to apply a systematic and comprehensive approach. It will eliminate all obstacles and mobilize financial resources to ensure sustainable development.

Abstract. The impact of the Covid-19 on Europe economy has been similar to that produced in the 2008 crisis, even with worse long-term consequences. Most governments have implemented recovery plans similar to those that were then implemented. However, there are differences in the economic impact that require different methodologies which focus on the microenvironment. Entrepreneurs' sponsorship may help to recover the current socio-economic situation. Simultaneously, technological progress in Artificial Intelligence and Big Data allows the analysis of vast amounts of information and support decision making. This paper shows a brief introduction of entrepreneurship policy in twenty countries after the irruption of the Covid-19 to contextualize, and applies Artificial Intelligence to examine factors whose influence is strong in the survival rate of entrepreneurs within a public support program. Specifically, two types of artificial networks are used: self-organizing maps and multilayer perceptron (respectively, SOM and MLP). After the application of neural networks on a data set of 2,221 entrepreneurs from Andalusia (Spain) and with 769 variables taken during the recovery after the crisis from 2008 to 2012, the prediction in the probability of entrepreneurial survival and business success is shown to be realistic in more than 98% of individuals analysed.

Keywords: entrepreneurship; sponsorship; artificial neural networks (ANN); self-organizing maps (SOM); multilayer perceptron (MLP)

1. Introduction

The policies carried out in the first half of 2020 and proposed by the governments for the recovery of the economy have been very different if we look at the countries of the European Union and associated with it. After the arrival of the first case of Coronavirus in Europe on January 24 (Rothe et al., 2020) and the first reactions to

control the spread of the disease, in such countries as France, Spain or Italy there has been one of the biggest falls in the economy in recent times, the rest of the reports followed world levels like USA or UK. The International Monetary Fund (IMF) now foresees a global recession of 3% in 2020 and a rebound of 5.8% in 2021. Still each month of confinement and isolation expansion has a direct impact on the economy and entrepreneurs in all these countries. However, if we compare this crisis with that of 2008, there is one issue worth noting: the speed and magnitude of the response from central banks and governments. Table 1 shows the distribution of total cases by country, the number of recovered, active cases and deaths, showing how it has affected some of the leading economies worldwide. Within a few weeks of the crisis, except for Russia and Turkey, most of the nine emerging economies in Central and Eastern Europe have already requested emergency assistance from the IMF. Italy and Spain, the third and fourth economies in the eurozone, were practically paralyzed as the two countries most affected by the pandemic; and other large economies such as Germany and France have applied severe restrictions on movement and activity.

Table 1. First countries affected by coronavirus according to data from May 17 2020, ordered by the number of deaths.

Country, Other	Total Cases	Total Deaths	Total Recovered	Active Cases	Serious, Critical	Tot Cases/ 1M pop	Deaths/ 1M pop
World	4,750,403	313,805	1,830,514	2,606,084	44,796	609	40.3
USA	1,509,422	90,142	339,572	1,079,708	16,248	4,563	273
UK	240,161	34,466	N/A	N/A	1,559	3,54	508
Italy	224,76	31,763	122,81	70,187	775	3,717	525
Spain	277,719	27,65	195,945	54,124	1,152	5,94	591
France	179,365	27,625	61,066	90,674	2,132	2,749	423

Although we can draw a parallel between the financial crisis of 2008 and the health crisis of 2020, there are some characteristics of the latter that differentiate it and frame its peculiarities (Barcena, 2020):

- The world is facing unprecedented health and humanitarian crisis in the last century in an adverse economic context. Unlike the last financial crisis, this is not a financial crisis but of people, health and wellness.
- A war economy situation is indispensable for the role of the state and not the market, therefore the states are taking a central role in suppressing the virus and the risks that will affect the economy and social cohesion.
- Flattening the contagion curve requires measures that reduce interpersonal contacts and will generate economic contraction, will paralyze productive activities and destroy aggregate / sectoral demand.
- How not to flatten the economy: strict and effective compliance with quarantines and health measures public will be the most efficient and fastest way to reduce economic costs.
- International cooperation: the way out of the crisis will depend on the economic strength of each country, so therefore, given the asymmetries between developed and developing countries, the role of the UN, the

IMF and the The World Bank will be essential to guarantee access to financing, sustain social spending and maintain economic activity with innovative measures ("out of the box").

There are many channels through which an infectious disease outbreak influences the economy. How it affects micro, small and medium-sized companies are given by the perceived opportunities that are one of the aspects that most affect entrepreneurs and entrepreneurs, as happened after the 2008 crisis, where practically all countries saw they saw affected. As can be seen in Figure 1, Spain and Italy lost a good part of that positive perception, which was not recovered until practically six years later. In other economic powers such as the United Kingdom and the USA. This recovery was faster. However, dependence on the giant has increased since that date and there is a rise in China's importance in the world economy today (McKibbin & Fernando, 2020).
Fig. 1. Perceived opportunities. Percentage of 18-64 population who see good opportunities to start a firm in the area where they live.
Source: National Expert Survey of GEM Monitor database and own elaboration.

Even though that numerous mechanisms have been implemented to guarantee the sustainability of companies and avoid serial bankruptcies, the impact on turnover and profits will not be less violent. Returning to normal will take time. Thus, while equity valuations may appear attractive at these levels, they will undoubtedly not be sufficient to fuel a sustained increase, given the weak outlook for activity.

Having regional governance, with criteria of the geography of health, with discussions to reach colective agreements, are unavoidable pillars in a hyper-connected world. The lack of union, agreed on standards and intertwined health policies further weaken the weakness of the situation, and we know that a diseased body is an easy prey for any storm, be it COVID-19 or other (DiGiacomo, 2020). That's why most of the world's governments have sought support from the political forces and citizens to be able to carry out decisions that affect our life and activity as we knew it until then.

Analyzing Figure 2 from National Expert Survey GEM Monitor database (Gem, 2020), there was a cyclical evolution that happened to the indicators of openness of the internal market, support and government policies, the financing of entrepreneurs, the bureaucracy and rates, and government support programs. It is observed that the decline after the crisis 2008 was widespread in the leading countries that have been affected by the Covid-19 crisis, taking up to 8 years on some indicators to return to 2006 rates. Due to the parallelism of both crises, and given that according to many of the sources consulted indicate the deepest depth of this health crisis, governments around the world must prepare to rebuild this set of indicators and strengthen their economy by supporting the entrepreneurship environment.
Fig. 2. Evolution of mean of entrepreneurship indicators: Internal market openness, Governmental support and policies, financing for entrepreneurs, taxes and bureaucracy and governmental programs of the ten more affected countries in the Covid-19 crisis (USA, Spain, Italy, UK, France, Germany, Brazil, Iran, Belgium and Netherlands).
Source: National Expert Survey of GEM Monitor data base and own elaboration.[†]

If we look at the preceding context in which the pandemic occurs, we see that it was not as favorable as we might think either. Young people have been hit in recent times by the crisis in a very significant way. Labor market conditions have changed, and they feel confused. There are guidance, counseling and support services for entrepreneurs. Still, they are not sure about the best way to help them. Despite the large amount of information

---

[†] Financing for entrepreneurs: The availability of financial resources "equity and debt" for small and medium enterprises (SMEs). Governmental support and policies: The extent to which public policies support entrepreneurship - entrepreneurship as a relevant economic issue. Taxes and bureaucracy: The extent to which public policies support entrepreneurship - taxes or regulations are either size-neutral or encourage new and SMEs. Governmental programs: The presence and quality of programs directly assisting SMEs at all levels of government (national, regional, municipal). Internal market openness: The extent to which new firms are free to enter existing markets

they have, they do not know which factors are positive and which are harmful, what effects will imply the inmediate decisions, what probability of success is hidden in each business sector, etc. As an alternative, often overly generalist training is imposed, in which very diverse contents are transmitted (Azizi and Mahmoudi, 2019; Sörensson and Bogren, 2019).

In this context, institutional support is considered essential. Concerning guidance to entrepreneurs, the importance of the intention to undertake is undoubted (Mamun, Che Nawi, Mohiuddin, Shamsudin and Fazal, 2017) and this fact makes it easier for entrepreneurs to be willing to receive training and prior support. However, it is not so clear that the other relevant factors can be taught to young people: first, because entrepreneurs cannot be oriented in one same way with different characteristics and different business ideas; second, because it is not well-known what leads to success in each case.

In this study, it is intended to combine one of the most critical crises suffered by humanity in recent decades with the use of the latest data analysis techniques since we are in the information age. The previous questions suggest the use of sophisticated tools, perhaps supported by Artificial Intelligence. Still, first it is convenient to ask if a computer program will be able to correctly guide an entrepreneur (or, at least, if computer science can help in this task to a support service for entrepreneurs). That's why it is necessary to develop a way to predict the success or survival of entrepreneurs based on the information available before starting the business venture. Once the probability of success is known in each case, it is possible to modify some of the input variables (maybe several times) and assess which is the best option for each entrepreneur.

Nowadays, the essential ingredients to enable the use of technology are already present: sufficient information, updated and validated, useful software for training artificial neural networks, entities (unusually public) interested in improving support services (Urban, 2019), etc. It remains unproven that the Artificial Intelligence-based methodologies are well-founded to solve this global problem.

Thus, the main objective of this paper is twofold: to verify if it is possible to use artificial intelligence to predict the success of entrepreneurs and to train an artificial neural network to do so, and use it in this context of world crisis caused by Covid-19.

Attend to the differences that have been observed in this current crisis concerning 2008 one, the new role for the state should be more stronger and supports those most affected which are micro, small and medium-sized enterprises that facilitate the development of the economy in which the International cooperation and interaction is limited. It is required not to fall into the errors that have been detected in the recovery from previous crises and to take advantage of all historical information to guide more efficiently and effectively entrepreneurs who intend to restore business models in this new environment. That's why, in the following sections, a brief analysis of the literature will be carried out to observe what factors to consider, and methodological review of artificial intelligence as SOM and MLP to build a success prediction model that allows a better performance of sponsorship in the reconstruction of the global economy.

1.2. Literature background

The entrepreneurial orientation can be understood as a set of processes and practices related to the decision making that enable the activity of both individuals and companies, which is an aspect that is positively associated with to profitability and growth of projects (Covin & Slevin, 1991; Ireland, Covin and Kuratko 2009; Wiklund & Shepherd 2005; Cuevas-Vargas, Parga-Montoya and Fernández-Escobedo, 2019).

If we analyze the set of capacities and qualities that define the entrepreneur, there are some of them linked to his attitude and the way of facing risk, reflecting his/her psychological and social profile (Al-Jubari, 2019). Although we try to reduce this risk, there are many other characteristics that maintain all their importance. According to the literature, these most relevant characteristics are the following: negotiating and commercial attitude (Douglas & Judge, 2001); ambition (Larrea & Ayerbe, 1996); positive mental attitude (Timmons & Spinelli, 1994); creativity (Hawkins & Turla, 1987); decision (Álvarez & Busenitz, 2001); social skills (Baron, 2000); initiative (Moskvina, 2013; Gibb, 1993); leadership (Anzola, 1997); planning (Sandberg, Robinson and Pearce, 2001; Stewart and Roth, 2001); tenacity (Rock, 1987); vision of the future (Filella, 1997). All these factors undoubtedly influence the success of the business project.

To carry out the present investigation, all factors that increase the sustainable competitive advantages of entrepreneurs (and, therefore, are key to their survival and growth) must be identified. Although there is no consensus on the definition of key concepts in entrepreneurship, the Theory of Resources and Capabilities maintains that the resources of the company influence the performance and organizational results, so that companies that have resources of superior quality will have greater benefits and greater possibilities of achieving sustainable competitive advantages (Peteraf, 1993). This idea provides an excellentclue to locate the most appropriate variables to measure the critical factors of entrepreneurship in each of the four classic approaches:

i. Within the "individual" approach, the prevailing variables are eare education, previous experience, intentions of the entrepreneur, entrepreneur attitude and age.
ii. In the "environment" approach: growth; structure; dynamism.
iii. In the "organization" approach: prior planning; social capital.
iv. In the "process" approach: focus and differentiation strategy; marketing ability.

In any case, to give a broader idea of what the existing literature contemplates and to justify the subsequent appearance of a complex model, next we list some factors that could be measured by other variables and that have also been considered critical factors in the business success, according to the literature (Mitchelmore and Rowley, 2010):

• Entrepreneurial skills: identification and definition of a viable market niche; development of appropriate products or services for companies to choose the market niche or product innovation; generation of the idea; surrounding analysis; recognize and envision taking advantage of opportunities; formulate strategies to take advantage of opportunities.
• Business and management skills: development of the management system necessary for the long-term functioning of the organization; acquisition and development of resources required by the company to operate; operational skills for business; previous involvement in the creation of other companies; managerial experience; familiarity with the industry; financial and budgeting skills; previous experience; direction style; marketing skills; technical skills; necessary skills in the industry; ability to implement the strategy (program development, budgets, procedures, performance evaluation); familiarity with the market; preparation of business plans; ability to achieve objectives; managerial skills.
• Competencies of personal relationships: development of the organizational culture necessary to guide the company; ability to delegate; ability to motivate other individuals and groups; hiring skills; skills for maintaining personal relationships; leadership skills.
• Conceptual and relationship competencies: conceptual competencies; organizational skills; interpersonal skills; skills to direct clients; ability to manage clients; mental capacity to coordinate activities; skills for written

communication; skills for oral communication; skills for decision making; skills for analysis; skills for logical thinking; negotiation skills; commitment capacity.

Despite the many variables of the previous lists, the characteristics of the entrepreneurs and their projects are not sufficient to predict business success. The environment not only affects the motivation of entrepreneurs and the generation of projects but also modulates the validity of the factors mentioned above: aspects that may be very relevant in an environment may not be significant in a different one. However, it is rarely possible to influence the environment, except through orientation and support for entrepreneurs. This research aims to justify that it is possible to estimate what will be the future result of an entrepreneur and use that estimate to optimize the processes of training, guidance and support.

1.3. Structure of the paper

Firstly, the data collection from the different available sources of information is explained, highlighting the database of the "Andalucía Emprende" Foundation. Several usual multivariate analysis methodologies are applied to these data, which serve to select the main variables that have a direct influence on the final variables that are to be optimized.

Secondly, the SOM methodology is applied to the data and the selected variables, grouping the cases according to their similarity in the set of variables studied. The groups obtained are analyzed and their relationship with the output variables is reviewed so that the profile of the entrepreneurs of each group can be characterized according to their probability of success, survival or failure. These groups are the basis for the efficient prediction of any probability since it requires a classification based on the a priori variables that are consistent with the variables (survival or success) that we want to estimate.

Thirdly, a MLP is trained and used to predict entrepreneurs' success. And finally, we reflect on how the results obtained can be useful to improve the probability of survival and success, based on the advice, the suggested training complements and the different types of public support offered.

2. Sample and methodology

The sample comes from the database of the "Andalucía Emprende" Foundation (AEF), which collects data on entrepreneurs from 1998. This information is taken in one of the regions with the most barriers and obstacles to entrepreneurship, during the time of the crisis from 2006 and recovery until 2013, which will help us to project the SOM and MPL models. The main descriptive statistics of this database can be found at "Relevant factors to optimize public services to support entrepreneurs and the survival rate of companies" (Chaves & Fedriani, 2018). The information it contains has been complemented by other databases of public access that are detailed below and that make it possible for the analysis to have a total of 769 explanatory variables:
• Data base from "Andalucía Emprende" Foundation: 238 variables of entrepreneurs. This research was supported by Pablo de Olavide University (Spain) and data was collected from this Foundation that participates in the European Erasmus for Young Entrepreneurs project through the project called MOVE YE.
• To consider the environment where the entrepreneur is located: 325 variables from the Institute of Statistics and Cartography of Andalusia (https://www.juntadeandalucia.es/institutodeestadisticaycartografia); 125 variables from the National Statistics Institute (https://www.ine.es/); 15 variables from the Cadastral Electronic Site (https://www.sedecatastro.gob.es).

• To consider the segment where the entrepreneur performs his activity: 250 variables from SABI Company Database (https://sabi.bvdinfo.com/ip/); 25 variables from Statistics of Foreign Trade (http://datacomex.comercio.es/); 16 variables from Statistics from the Central Mercantile Register (http://www.rmc.es/estadisticas/EstadisticaSocietaria.aspx).

The variables mentioned above have been classified into three groups, according to Schnabl (2010). Of these variables, the main ones that have been used for the design of neural networks are highlighted below, after performing the first screen according to their significance:

(1) Descriptive variables of the entrepreneur and the project: the level of studies of the entrepreneur before the start-up of the project (if there are several promoters, the mean is calculated); the legal form of the new company; type of activity carried out by the company; the investment planned in the budget presented within the business plan; the funding provided in the budget; the level of studies (if there are several promoters, the maximum is calculated); the age of the promoter(if there is more than one promoter, the average value is calculated); the number of full-time employees with whom the business project starts.

(2) Environment variables and public support: the contractual relationship with the "Andalucía Emprende" Foundation (classified as "incubation" or "pre-incubation"); the type of accommodation (office, warehouse or "no accommodation provided"); the incentives for creation or innovation (dichotomous variable); the number of support services received in the first three months of activity; the financial profitability of the environment; participation in a program to revitalize the local productive fabric (dichotomous variable); the economic indicator of the environment (aggregate index on the business fabric of the municipality in which the entrepreneur is located); if there is a forecast of employment that is generated by the entrepreneur within the business plan presented (dichotomous variable).

(3) Dependent variables and other variables linked to the interpretation of the model: business success (if it meets the objective defined at the beginning of its activity); failure (its survival is less than two years after its creation); the average value of added indefinite workers; the average value of added temporary workers; average billing of the project; the ratio between billing and project employees; relative financial profitability concerning companies in the sector; total investments made. About survival time, we must consider that there are cases of companies that meet short-term objectives of less than one year, in which case they would not fall within this denomination and would have to be analyzed separately (Morris, Schindehutte and Allen 2005; George & Bock 2011; Bruneel, Spithoven and Clarysse 2017).

In particular, the dependent variables in this third item are incorporated in order to have different ways to infer if each entrepreneur has achieved his initial objectives.

The techniques applied in this paper can be classified into two main groups located in the two corresponding phases of the study. First, multivariate analysis is used to select the relevant variables. Since the database has a large number of variables for each business project, it is convenient to distinguish between those variables that are significant and those that are not relevant for the type of research that is intended to be carried out. Subsequently, two different types of artificial neural networks are applied. The SOM technique is responsible for the unsupervised classification within the group of possible cases; this classification is essential to be able to predict later the probability of success, failure and survival of each individual because such estimation would only be useful if the groups generated on the basis of the "independent" variables behaved in a homogeneous way with respect to the "dependent" variables. Finally, with the aid of the definition of success, a MLP estimates the probability of success from the initial variables. The main tools used in this study, the neural networks (SOM and MLP), are described below.

SOM technique

Unlike the networks with supervised training (like MLP), the classification of the cases by SOM is carried out autonomously (without requiring the participation of the researcher), discovering common characteristics among the instances, regularities, correlations as well as categories in the input data.

Accurately, the SOM analysis of the data has been carried out to obtaining a first unforced classification of homogeneous groups that can serve to understand the behavior of entrepreneurs better and to justify the viability of using supervised neural networks for classification, simulation, adjustment and estimation. For the calculations, the "Kohonen" package of the R program was used, with a grid of 10x10, with several iterations of 500, with an Alpha learning rate of 0.05 to 0.01 and with 100 neurons. The SOM model was designed based on the set of all the prior descriptive variables, previously using classical multivariate techniques for the selection of variables. Among the methods used, the following stand out: (i) cluster analysis; (ii) factor analysis; (iii) logit analysis; (iv) structural equation models; (v) decision trees (Mangiameli, Chen and West, 1996).

Let us contextualize the technique used (SOM). It was developed in 1982, thanks to pieces of evidence discovered at the brain level by T. Kohonen. A SOM is an artificial neural network composed of two layers where a competition of neurons of the output layer takes place. This type of model is an unsupervised network because there is no external expert that indicates whether the neural network is operating correctly or incorrectly; this is consistent with the fact that no measurable output is available to which the neural network should tend. Consequently, in the training phase not only the weights of the winning neuron are updated but also the weights of neighboring neurons are modified, for which a neighborhood function is defined: $f(i,i*)$, where $i*$ is the so-called "winner neuron" (Lamedica *et al.*, 1996).

The goal of a SOM is to discover common characteristics, regularities, correlations as well as categories in the input data. The feature space is based on the physical disposition of the output neurons to model some of the characteristics of the input space. It is said, therefore, that the neurons must self-organize according to the stimuli (data) coming from the outside. In this sense, with the usual notation, if two inputs, x_1 and x_2, are close to each other concerning some measure in the input space and cause the activation of the output neurons, then y_a and y_b must be close to each other with respect to some type of composition or disposition of the output neurons (Curiel-Marín, Passoni, Olmedo-Moreno and Fernández-Cano, 2018).

Due to the final two-dimensional output, the SOM can be understood as a projection from a high-dimensional data space to a two-dimensional graph of neurons. The most common topologies of this type of network are rectangular and hexagonal (Aparanji, Wali and Aparna 2018), being the latter the one used in this work.
The proposed SOM method is divided here into two fundamental phases. First, a prototype is selected as the winner of a competition between all of them and then the winning prototype is moved to better represent the points that belong to it. In the first phase, a distance between the prototypes and a point of the set of examples is calculated. For the calculation of this value, distance measures such as, for example, the Euclidean distance can be used. Then the prototype approaches following the learning equations.

Supervised learning: MLP

The history of the MLP is, if possible, better known than that of SOMs because its origin is in the simple perceptron, with which it can be said that the theory of artificial neural networks began. In the 1960s, the problems that the simple perceptron had were evident, but it was not until 1986 when Rumelhart and other authors improved the training system of the first artificial neural networks to allow their use with more than one hidden layer.

A MLP is a neural network that trains similarly to the human brain: by trial and error. When designing an MLP, the number of layers and the number of neurons per layer are determined. One can also determine the type of neuron activation function and the training procedure. Each edge or arch (which connects two neurons of consecutive layers) has a weight, which can be initially set but will change with training. Broadly speaking, the training of a MLP consists in presenting to the system some patterns (or particular cases) of which the result is known. If the network is right in its forecast on a case, its weights are not modified (i.e. the network "does not learn"). If the network fails to forecast, its weights will be modified to get closer to the desired result. When this process has been repeated enough times, the network is considered to have been trained.

To prevent that the learning of the data (overtraining), the data set is usually divided into two or more pieces: one is used for training and others to validate if the network also works with other data set (different from those used to train).

In general, the MLP fits much better than classical multivariate analysis, but it is often difficult to interpret the model generated by artificial intelligence. Anyway, once the neural network is trained, it is proposed to analyze the model obtained to deduce information about the factors that influence survival, which would allow, for example, in our case, to find out how to optimize the support service.

The MLP we use is a multilayer perceptron, two-layer feedforward model enhancement. The first layer with 84 neurons and the second with 3, with a minimum training accuracy of 90%. In our case, two different procedures have been used to train the two-layer MLP.

The first training was done with the SPSS software. Here, 70% of the data was used for network training, 10% for validation and the remaining 20% for testing. Obviously, due to the stochastic nature of the training process, every time it is repeated, slightly different results appear (although all of them may be similar). This also occurs if another MLP is designed or other software is used to train.

Second, a model improvement MLP has been used. The combination rule used for categorical variables is voting and the number of component models for self-increase and aggregation is 10.

Self-documenting aggregation produces replications of the training data set by sampling with the repetition of the original data set. Create bootstrap samples of equal size to the original data set. That is, a "component model" is created from each replication. Together, these component models form an assembly model. The set model scores some records with a combination rule; the available rules depend on the level of measurement of the destination. The program used for this other training has been the IBM modeler. The method generates a set model through self-document aggregation, which generates several models to obtain more reliable predictions. It may take longer to generate and score sets than a standard model.

3. Results and discussion

A database of 769 variables was considered and, before the SOM analysis, a reduction in the number of variables was made through association analysis, a factorial study and other multivariate techniques, which allow us to identify which variables best explain the variable dependent within each category: descriptive variables of the entrepreneur and the project and environment variables and public support. Once a selection of 72 variables has been obtained, the SOM training is carried out.

Figure 3 shows the process of iterations in the SOM training. The average distance from each node to the nearby units shows, through the iterations, the expected progressive descent.
Fig. 3. The training process of the ANN. Source own elaboration
Source: own elaboration from AEF database.

If we look at the general distance map (Figure 4), where the distances between the nodes are shown, some differentiated zones can be seen. In general, the presence of nodes with a considerable distance means that there are very differentiated nodes that, therefore, will be more likely to belong to different groups.
Fig. 4. Graph of SOM distances. Source own elaboration
Source: own elaboration from AEF database.

Figure 5 shows the values in each of the variables that have been used to train the network, although in this case it is not shown with the classic radial format but in a linear manner, because of the high number of variables. Note that nodes with a similar silhouette (which implies even values in the different variables), are within the same classification (that is, in the same group or "cluster"). For the conformation of the clusters the function "add.cluster" has been used within the R program available in the Kohonen statistical package.
Fig. 5. Codes graph. Source own elaboration
Source: own elaboration from AEF database.

Figure 6 shows the case counts for each node. The group represented to the left is the most numerous and there are also some nodes marked with an asterisk, which implies that no case has been located within those nodes. Additionally, in Figure 5, the five clusters obtained through the application of SOM to the database of entrepreneurs in Andalusia are presented again, although more simply.

Grosso modo, it is observed that the clusters have the following characteristics which would be taken into account in order to predict the probability of success:
• *Cluster 1*: entrepreneurs without employment plan or impact on the local productive sector and accommodation.
• *Cluster 2*: entrepreneurs with an employment plan.
• *Cluster 3*: entrepreneurs who have a development plan, do not have an employment plan, but have an impact on the local productive sector.
• *Cluster 4*: entrepreneurs without an employment plan or incidence in the local productive sector and with accommodation (office) provided.
• *Cluster 5*: entrepreneurs without an employment plan, with an impact on the local productive sector and without accommodation (office) provided.

Table 2. Summary of descriptive statistics of the clusters

	Indefinite workers (average)	Temporary workers (average)	Mean gross sales	Gross sales/ employees	Relative financial profitability	Total investments
Cluster 1	1.97	2.31	99,925 €	43,932 €	27.20%	24,499 €
Cluster 2	2.93	3.05	120,655 €	46,393 €	72.80%	15,548 €
Cluster 3	2.55	1.73	90,536 €	73,136 €	18.90%	21,591 €
Cluster 4	1.65	1.77	69,241 €	42,011 €	34.80%	9,642 €
Cluster 5	n/a	n/a	n/a	n/a	n/a	n/a

Table 2 specifies the behavior of each of the clusters concerning the dependent variables considered to validate the classification obtained (note that the data from cluster 5 are not sufficient to assess success since most of these cases have not survived two years).

When performing the statistical tests to verify that there is an association with a "success" variable (obtained from the previous dependent variables) in each of the clusters, it is observed that it can be accepted that there are significant differences between the obtained clusters (Table 3).

Since it is possible to use an artificial neural network to classify the data appropiately for the present line of research, likely, it will also be possible to train another neural network (for example, a MLP) to be able to estimate the probability of success of each individual that is going to start a business entrepreneurship project.

Table 3. Pearson's chi-squared test for association

	Value	df	Asymp. Sig. (2-sided)
Pearson chi-square	50.146	12	<0.0005
Likelihood ratio	48.708	12	<0.0005
Linear-by-linear association	0.932	1	0.334
N of valid cases	2,210		

Source: own elaboration from AEF database.

The first MLP was trained by data partition and with SPSS software. In this case, the neural network classified the cases according to Table 4.

Table 4. Classification of cases by MLP

Classification / MLP	Success	Survival	Failure	Total PML
Success	123	6	1	130
Survival	2	985	9	996
Failure	0	6	1047	1053
Total cases	125	997	1057	

Source: own elaboration from AEF database.

With the repetition of training several times, it was possible to get the trained network to succeed in its forecast on the set of tests 98.4% of times.

The next MLP training was obtained with a model of stability improvement by self-aggregation aggregation and through IBM modeler (see details in Table 5).

According to the resulting models, the most relevant variables are the sector; the probability of survival of the environment; the number of employees; the region; the number of support services. Note that during the orientation process you can act by modifying the project to choose the most convenient values in most of the variables listed above. I Variables such as the probability of survival indicate the importance of choosing the location for the first implementation of entrepreneurs. Others like the number of entrepreneurship support services received that detail the interest or involvement of the new entrepreneur in the project, clearly influences the venture's probability of success, not so much individually but as a combination of factors, which is one of the justifications for using SOM analysis and neural networks as a methodology for prediction of success.

Table 5. Pearson's chi-squared test for association.

Model Summary		
Training	Cross Entropy Error	479,809
	% of incorrect forecasts	8%
	Stop rule used	1 step
		consecutive without decreasing the error a
	Preparation time	00:03,1
Test	Cross Entropy Error	175,204
	% of incorrect forecasts	5,80%
Variable dependent: RNA_Éxito

Conclusions

Entrepreneurship is not only essential to reduce unemployment, but it is also critical to improve the competitiveness of the economy (Spulber, 2014; Mamun et al., 2017). In this context of global Covid-19 crisis in which the most efficient and effective mechanisms for economic recovery through entrepreneurship are required, this paper aimed to clarify if it is possible to support entrepreneurs by knowing a priori the probability of success of a business project based on the rest of the variables that affect the entrepreneur and his/her environment. A

technique based on artificial intelligence is adapted, by using self-organizing maps and a multilayer perceptron could make it possible.

After analyzing the context of the economic crisis in the first semester, considering differences of the current crisis concerning that of 2008, it has been observed that the role of the state has more weight and must take into account those most affected (micro, small and medium-size business). The opportunities perceived in the past financial crisis did not recover until after four years in most countries, except in those where the degree of government support and policies, financing for entrepreneurs and government programs were taken into account. The vast amount of historical information can no longer be wasted and we must use the new artificial intelligence techniques, avoiding general recipes for training and institutional support and being able to reconstitute the perceived opportunities of future entrepreneurs and, therefore, rebuilding the economy.

As previously cited, a replicable entrepreneurial success prediction model has been built today, based on two MLP and SOM techniques that have a hight capacity to take advantage of all this volume of historical information that is available on entrepreneurs. MLPs usually fit the data very well, but this is not proof that the model serves to predict in new situations (by overtraining). Therefore, it has been studied whether the data were likely to be grouped intrinsically and if this classification was related to survival and business success.

In the graph of SOM distances obtained, some differentiated zones can be observed. Nodes with a massive distance show highly differentiated cases and, therefore, will be more likely to belong to different groups, which behave differently in any attempt to predict success. Five groups of nodes were determined by the SOM trained, and the characteristics of the different groups revealed significant differences among them, in terms of the probability of failure (not survival), survival or success.

The differences in the probability of success among these homogeneous clusters seemed to be even independent of the definition chosen for this explained variable. If the explanatory variables are modified, the probability of success is affected. This is especially interesting if we consider simultaneously those variables that can be controlled from the point of view of the institutions that support entrepreneurs (assistance or accommodation, among others) as well as those variables linked to the environment where the project is to be located (one can study, for example, which location maximizes the future viability of the business project).

When developing the SOM, the variables that have been shown to affect more the prediction of the model are the following that there are significant differences in the five groups obtained at a 95% level of confidence:

•	Environment: local productive; employment plan; type of business accommodation; financial profitability of the environment; supporting services; economic indicators of the environment.
•	Entrepreneur and project: activity of the company; investment; financing; educational level; legal form; employees.

To achieve the most motivating results of the study (taking advantage of the possibilities of artificial neural networks), once the SOM groups have been obtained, a multilayer perceptron was designed with the entrepreneur variables and trained with the available data set. It helped the training to incorporate the "group" variable obtained by the SOM. This allowed us to model and make predictions about the probability of success of an entrepreneur, as well as to know the variations of probabilities when changing the values of the initial variables. The more influential variables became: the sector; the probability of survival of the environment; the number of employees; the province; and the number of support services.

We hold that it makes sense to apply this type of methodology in practice when sufficient data are available (in number and reliability) to train a neural network properly. Today, public support systems for entrepreneurs have abundant sets of adequate data; however, they do not usually take advantage of them, beyond the use that each support service worker makes individually (and, in many cases, subconscious). As has been seen in the present investigation, there are factors that condition the success of entrepreneurs and that can be modulated through the support service itself or the modification of the business project in question. Besides, it can be deduced that there is no single recipe for success, but that entrepreneurs can be classified according to their characteristics and their projects so that belonging to one of the groups implies that certain actions in the counseling will have a different effect of what is expected in cases belonging to other groups.

If we attend to this set of recommendations, to the question ways to support entrepreneurship after the covid-19 crisis, it is possible to perform as a joint and coordinated system that includes analyzes and decides according to the following considerations:
- The combination of variables that the entrepreneur brings in.
- The optimal business segment to carry out his activity.
- The most favorable values of the investment budget.
- The training, capacities and technical characteristics that the entrepreneur must have or promote.
- The type of service we must provide you throughout your career.
- The support institution will define all these factors through the system of maximizing the expected benefit built on the basis of the neural network system explained in this study.

In conclusion, an unsupervised artificial neural network generated groups compatible with an eventual classification of entrepreneurs according to their level of success. Hence, there is non-subjective information in the data that determines the probability of business success. Thanks to the SOM technique, it has been possible to establish groups where it is easy to classify the cases of entrepreneurship a priori and which seem to behave in a significantly different way from the rest concerning the variables that are often used to measure business success. Besides, by using other quite reasonable estimation techniques like MLP, it is possible to obtain really good fits. In fact, the network was trained several times and all of them came out something similar, which supports the reliability of the model. Therefore, it is realistic to know in each case the influence of relevant factors related to the advice for increasing the chances of success of the entrepreneurs. This final model will be the basis for implementing an artificial intelligence system to improve the orientation of future entrepreneurs.

As for recommendations for further research, a functional relationship could be obtained in any other region, between the initial variables (which describe the characteristics of the entrepreneur, the project, the environment, as well as the type of public service received) and the final variables of success (success, survival, failure, economic and financial indicators of performance, etc.). In a same technological application, it would be possible to implement the different aspects developed in the research: (i) to collect and process the necessary information for the estimations; (ii) training the specific neural network for the specific socio-economic situation to be improved; (iii) use of the forecasts to make the most appropriate recommendations to each individual; (iv) use the final information obtained to improve the estimates in subsequent counseling processes.

In short, we must be aware that we are heading to a time when human decisions can be based on the information that lies in extensive databases that cannot be accessed by the human brain (as in Stukal et al. 2019). The right use of artificial intelligence can allow us to optimize the chances of success in the implementation of solutions for the most significant economic and social problems of our days.

Abstract. Kazakhstan has all the prerequisites for the formation of innovative potential. However, to ensure the innovative economic development of Kazakhstan, it is necessary to create favorable conditions that promote the commercialization of innovations. Otherwise, all expenditures that are currently primarily of a state nature will not have the required economic indicators. The modern theory of sustainable economic growth is based on the concept of innovation. That is why the main indicators of overall economic development depend on innovative development. The article studies the variability of a data group formed from indicators of innovative development of the economy of Kazakhstan, using one of the methods of reducing dimension as a correlation analysis. The data of 2000–2018 are analyzed, that is, for 19 years. Discusses the correlation analysis of indicators characterizing the amount of research and development costs and gross domestic product. The obtained correlation coefficients demonstrate a strong linear relationship between the selected indicators. The statistical analysis showed: patterns of change in the GDP of the economy internal R&D costs are almost identical, correlation-regression model of the impact of GDP on domestic R&D expenditures. That is, the number of innovatively active enterprises and internal R&D costs are interdependent variables with a close correlation. High correlation coefficients between the registration of patent applications and the grant of patents in Kazakhstan and the number of employees performing R&D. A strong but negative relationship between the number of organizations performing research and development and the rest, perhaps some organizations exist only nominally and their economic activity is minimal.

Keywords: impact; correlation; relationship; GDP dynamics; economic growth; innovation

1. Introduction

The study is devoted to the disclosure of the internal structure of the relationships in the data array used to assess the state of innovative development of the economy of Kazakhstan. Such work involves the statistical processing of raw data using multivariate statistical analysis methods. From a usual analysis of the dynamics of indicators, you can also get important information about the nature and patterns of data changes, but such a study, as a rule, does not provide a complete picture of the relationships.

One of the effective tools for statistical research in economics is correlation analysis, correlation analysis allows you to group the source data by the influence of external factors. That is, in essence, it is possible to create a statistical model of the problem in which the variability of all parameters is explained by the identified factors. The weight or significance of one or another factor can be estimated by the value of its share in the total variance of variables. And the close connection of each parameter of the problem with a specific factor is estimated by the correlation coefficient.

Research in the innovation sector of the economy, as a rule, comes down to an analysis of the dynamics of indicators using correlation and regression analyzes. From a usual analysis of the dynamics of indicators, you can also get important information about the nature and patterns of data changes, but such a study does not provide a complete picture of the relationships.

Of the methods of multivariate statistical analysis, the use of dimensionality reduction, as factor analysis is sometimes called, provides an opportunity to reveal the logical structure of a complex phenomenon. The main assumption of factor analysis is that phenomena in a certain field of research can be described by a relatively small number of factors. It is assumed that in the study area there is a pattern that combines the studied data into some groups.

Moreover, it is believed that each group of data has a certain factor. The term "factor" is used here in the sense of an objective reason, which unites heterogeneous data. That is, in essence, it is possible to create a statistical model of the problem in which the variability of all parameters is explained by the identified factors. The weight or significance of one or another factor can be estimated by the value of its share in the total variance of variables. And the close connection of each parameter of the problem with a specific factor is estimated by the correlation coefficient.

2. Literature review

Innovation is one of the most important components of the modern economy, a "stepping stone" to improving the quality of life and a sustainable, environmentally friendly future. Innovation is an important part of socio-economic life and human life in all its manifestations. Today, there are more than a hundred different definitions and interpretations of the term "innovation".

In recent decades, innovation has become one of the most intensively researched topics in economics and management. World practice shows that the development of innovations is not only the main tool to increase the competitiveness of a single enterprise, but also acts as a serious incentive for the economic development of the country as a whole.

Both the current state of innovative development of the economy of Kazakhstan and the history of its development are considered in detail in many analytical works (Satpayeva, 2017; Shevyakova, Munsh, Arystan, 2019; Petrenko, Vechkinzova, Antonov, 2019; Caurkubule, Kenzhin, Bekniyazova, Bayandina, Dyussembekova, 2020). An important result of studying the state of affairs is the conclusion that the country's innovative development, being an important sector of the economy, has not yet fully realized its potential capabilities.

The works of a number of scientists are devoted to the problems of innovative development of the economy, innovative activity of industrial enterprises and the introduction of innovations: (Cohen, 2010), (Baltgailis, 2019), (Chesbrough, Vanhaverbeke & West, 2006), (Cohen & Levinthal, 1989), (Damanpour & Aravind, 2012), (Denis, 2001), (Gogtay & Thatte, 2017), (Glen, 2015), (Hauke & Kossowski, 2011), (Murzabekova, 2010), (Niyazbekova, Grekov & Blokhina, 2016), (Nurzhanova, Niyazbekova, Nurpeisova, Imangozhina, Satenova, 2020), (Tereliansky, 2016), (Koroteev, Terelyanskii, Ivanyuk, 2016), (Satpayeva, 2017), (Tvaronavičienė & Razminienė 2017), (Schumpeter, 1934), (Schumpeter, 1942), (Semenyuk, Abdrashitova, Beloussova, Nechay, Listkov, Kurbatova, Niyazbekova, 2018), (Xiong, Jianmu, Wang, 2019). (Vigliarolo, 2020), (Weidlich, 2000), (Tvaronavičienė, & Ślusarczyk, 2019), (Witt & Zellner, 2009).

In the studies ofscientists, experts in economics and management, correlation analysis by the method of identifying the relationship, the mutual influence of various socio-economic processes.

In 1896, the correlation coefficient was first formulated and studied by Karl Pearson (Hauke & Kossovsky, 2011), with the concepts of correlation of Francis Galton: (Hauke & Kossovsky, 2011). Correlation analysis is used in the study of risks in the field of public and private investment management. The problems of the influence of financial markets on sustainable economic growth are investigated.

Correlation analysis is also used in the field of risk reduction associated with the management of production and company assets. Risks associated with solving organizational problems. Some scholars pay great attention to studying the correlation of the dynamics of the tourism industry and regional economic growth.

Correlation is designed to study the degree of relationship between two variables. The correlation coefficient is a measure to quantify the degree of relationship between variables. Essentially, the correlation coefficient r will be in the range from -1 to +1, i.e., $-1 \leq r \leq +1$ (Hauke & Kossovsky, 2011).

3. Methodology

An important component of the development of the country's economy is innovation, the level of development of which creates the basis for the sustainability of economics growth, contributes to the implementation of the strategic objectives of the territory. Innovative activity is an indicator of innovative activity. In accordance with the methodology of the Committee of Statistics of the National Economy of the Republic of Kazakhstan, innovation activity is determined by the ratio of the number of organization implementing technological, organizational, marketing innovations to the total number of organizations surveyed. Figure 1 illustrates the dynamics of innovation activity in the field of innovation in Kazakhstan for 2008-2018.
Figure 1. Level of activity in the field of innovation. Source: Committee on statistics, Ministry of national economy of the Republic of Kazakhstan

As the source of data used "Basic socio-economic indicators of the Republic of Kazakhstan for 1991-2019". The data of 2000-2018 are analyzed, that is, for 19 years. From the entire list of data on the innovative development of the country's economy, the analysis included the following indicators: a) GDP at current U.S. prices dollars, billions; b) domestics R&D costs in dollars (Table 1).

Table 1. Indicators that characterize R &D expenditures and GDP at current prices

Years	GDP at current prices U.S. dollars, Billions (y_i)	Internal R & D expenditures in millions of dollars (x_i)
2000	18,292	33,11616126
2001	22,153	48,75357776
2002	24,637	62,84512004
2003	30,834	77,84128894
2004	43,152	107,1728903
2005	57,125	162,0063215
2006	81,003	196,6841145
2007	104,85	218,9800082
2008	133,442	288,957606
2009	115,309	264,3301695
2010	148,047	227,1245334
2011	192,626	295,6731687
2012	207,999	350,2296962
2013	236,635	405,3947282
2014	221,416	364,5472527
2015	184,388	374,6102703
2016	137,289	195,8826471
2017	162,887	220,7826923
2018	172,941	220,8700306

Source: World Bank Open Data

We will find out whether there is a relationship between the indicators characterizing the costs of R&D and the indicators of GDP.

To do this, we construct a correlation analysis between two groups of indicators: a) GDP at current U.S. prices. dollars, Billions, b) internal R&D costs in dollars.
The correlation coefficient is estimated by the following formula:

$$r_{xy} = \frac{\sum_{i=1}^{n}(x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n}(x_i - \bar{x})^2 \sum_{i=1}^{n}(y_i - \bar{y})^2}}$$

where, x_i — sample data on internal research and development costs in the Republic of Kazakhstan (in dollars); y_i — sample data on GDP at current prices (dollars); n — number of observations; $\bar{x}, \bar{y}$ — estimates of mathematical expectations.
Thus, the correlation coefficient for the quantities x_i, y_i is:

$$r_{xy} = \frac{\sum_{i=1}^{n}(x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n}(x_i - \bar{x})^2 \sum_{i=1}^{n}(y_i - \bar{y})^2}} = 0.9380$$

Thus, the correlation value is 0.9380. This means that x_i, y_i there is a fairly close linear relationship between the variables, and on the basis of research it can be concluded that innovative development is highly dependent on the use and implementation of highly efficient technologies and the latest developments, as well as the development of science and technology.
Figure 2. Indicators that characterize the introduction of innovations in the economy of the Republic of Kazakhstan.

Figure 2 shows graphs of changes in GDP at current prices, as well as domestic R&D costs (in dollars). From a visual inspection of the graphs it can be seen that the patterns of change in the GDP of the economy and the internal costs of R&D are almost identical.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810
Figure 3. Correlation and regression model of the impact of GDP on domestic R & d expenditures.

The calculated correlation and regression model shows a strong positive effect of GDP on domestic R&D expenditures (Figure 3).

Figure 3 shows a comprehensive statistical method for spot forecasting a system of economic indicators. The main features of this method are:

1. The method allows in a complex to consider a variety of useful information about the forecasted system of economic indicators: trends in indicators over time, statistical patterns of relationships between indicators, balance ratios, etc.

2. When making predictive calculations of economic indicators using the integrated method, you can simultaneously use an arbitrary number of private statistical models for each forecast indicator. Between themselves, these models can differ in the number and composition of the independent factors of the economic process that enter into them, the structure of the relationship between the dependent and independent variables of the external and internal environment of the organization.

To identify the best trend equation of the analyzed time series, we determine the parameters of the following main types of trends: linear, parabolic, power-law, exponential, hyperbolic. The results of these calculations are shown below:

1. Linear finction
   $y=1.4705x+39.003$; $R^2 = 0.8799$
2. Logarithmic function
   $y=124.53\ ln(x)-346.95$; $R^2 = 0.8627$
3. Power function
   $y=4.1931x^{0.928}$; $R^2 = 0.9322$
4. Exponential function
   $y=60.287e^{0.009}$; $R^2 = 0.7975$

The calculated correlation and regression model show a strong positive effect of GDP on domestic R&D expenditures (Figure 3). The highest values of the exponent R^2 correspond to nonlinear functions, like the logarithmic function ($R^2 = 0.8627$) and the exponential function ($R^2 = 0.795$).

4. Application functionality

In this section, we consider the innovative activity of Kazakhstan enterprises in all types of innovations. The full use of innovations for national development is possible only if a targeted innovation policy is carried out at the state level. This task is especially relevant for Kazakhstan, which has significant innovative potential, which is clearly used insufficiently. Thus, the level of innovative activity of enterprises, despite the growth from 9.3 in 2016 to 9.6 in 2017 and in 2018, reached only 10.6. The number of enterprises with innovations decreased from 421 in 2008 to 384 in 2018.

The innovative activity of Kazakhstan enterprises in all types of innovations in 2018 was characterized as follows. Of the 30,501 respondents, only 3,230 were innovation-active, that is, the level of activity in the field of innovation was only 10.6%. The enterprises of the Republic of Kazakhstan by type of innovation are divided into the following:
- product innovations;
- process;
- marketing;
- organizational innovation.

In 2018, out of 3,230 innovation-active enterprises, 863 had product innovations, 1,530 had process innovations, 700 had marketing innovations, 1,082 had organizational innovations, and only 37 had all four types of innovations. The innovative activity of enterprises in product and process innovations does not have a pronounced upward trend. If in 2008 the level of activity of enterprises in this area was 4.0%, then in 2018 it increased to 10.6%.

Kazakhstani enterprises do not seek to research and development independently and are not inclined to invest in the creation of new products. One of the problems of innovative development in Kazakhstan is the incompleteness of scientific research, its separation from production, as the applied developments are not continued in the form of commercialization and implementation in production. In order to solve this problem, Kazakhstan has adopted a number of Programs, created Institutes, adopted Laws. An important role in this is given to the development of innovative entrepreneurship capable of quickly establishing high-tech products.

In the Republic of Kazakhstan, 384 organizations were engaged in research and development in 2018 (386 organizations in 2017).So in 2018, in terms of the number of innovatively active enterprises, the three leaders were: Almaty - 135 enterprises, Nur-Sultan - 60 enterprises, East Kazakhstan region - 35 enterprises.

At the same time, the smallest number of innovation-active ones according to the results of 2018 was demonstrated by Mangistau region - 6 enterprises, North Kazakhstan region –5 enterprises (Table 2).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Table 2. Number of organizations performing research and development in the regions of Kazakhstan

	2014	2015	2016	2017	2018
Republic of Kazakhstan	392	390	383	386	384
Akmola	11	11	9	11	11
Aktobe	14	14	14	16	16
Almaty	13	11	10	11	9
Atyrau	9	10	11	10	10
West Kazakhstan	9	7	8	8	10
Zhambyl	11	11	11	11	9
Karaganda	31	32	33	29	28
Kostanay	13	14	13	14	12
Kyzylorda	6	8	10	8	7

East Kazakhstan	30	30	35	34	35
Nur-Sultan	59	53	55	62	60
Almaty	148	152	133	131	135
Shymkent	12	15	14	13	11

Source: Ministry of National Economy of the RK, committee of statistics, information for 2019

The highest level of innovative activity of enterprises was observed in the East Kazakhstan region - 15.5%, which is almost 1.5 times higher than the republican indicator. Next come the cities of Nur-Sultan and the cities of Karaganda, the cities of Kyzylorda - 14.7%, 14.7 and 12.2%, respectively. The lowest indicators of innovative activity of enterprises in the Mangistau region are 4.0% (Figure 4).

Analysis of statistical data on the innovative development of the regions of Kazakhstan allows us to distinguish three groups of regions of the Republic of Kazakhstan by the level of innovative activity:
- with a low level: Mangistau, Turkestan, West Kazakhstan;
- with an average level: Kostanay, Kyzylorda, North Kazakhstan, etc.;
- with a high level: East Kazakhstan region, the city of Nur-Sultan and Karaganda region.

The Republic of Kazakhstan is characterized by significant differences in the level of innovative potential of the regions, while the innovative capabilities of most areas can be rated as average.

In the modern world, transport services provide an increase in the efficiency of social production, the normal functioning of the economy. The issue of introducing innovations in the transport sector of Kazakhstan is of great relevance, since it is here that conditions are created for the rational distribution of production forces across the country, taking into account the most appropriate approach to production consumption areas and sources of raw

materials for enterprises of various sectors of the economy, which allows such industries as agriculture to develop, trade and the rest.
Figure 4. The level of innovation activity of enterprises for all types of innovations in 2018.

The expenditures of Kazakhstan for research and development (R&D) averaged 0, 1% of GDP, while on the recommendation of UNESCO, developing countries need to bring R&D expenditures to 1% of GDP. Currently, the share of scientific research in the EU countries is on average 1.8 percent of European GDP, it is planned to bring this indicator to 4 percent.

This indicator is in Finland - 3.49%, Korea - 3.64%, USA - 2.6%, China - 1.44% of the country's gross domestic product, and on average in the countries of the Organization for Economic Cooperation and Development - 2, 24%.

In comparison with the data for Kazakhstan, this suggests that financial support for research and development remains a weak link in Kazakhstan's innovation policy. For comparison, it should be noted that in developed countries, the expenditures of the business sector significantly exceed government spending on R&D, since fundamental research is traditionally carried out in the public sector, and the business sector is engaged in applied research.

Table 3. Introduction of innovations in the economy of the Republic of Kazakhstan

Main indicators	2010	2011	2012	2013	2014	2015	2016	2017	2018

A quantitative approach to assessing innovative potential involves the analysis of a system of statistical indicators that reflect the dynamics of the development of the scientific and innovative sphere. In the Republic of Kazakhstan in recent years, the costs of research and development have steadily increased in comparable prices. Figure 5 presents the dynamics of the main indicators of the state and development of science in Kazakhstan for 2010-2018.
Figure 5. Main indicators of science development in Kazakhstan for 2010-2018

Let us consider the dependencies of the key factors of the innovative development of the Kazakhstan economy, including:

- number of employees performing R&D, by ownership of organizations, thousand people;
- number of innovatively active enterprises, units;
- domestic R&D costs, mln tenge;
- domestic R&D costs from the public sector, mln tenge;
- share of innovative products (goods, services) to GDP;
- costs of technological innovation of enterprises by ownership, mln tenge;
- registration of trademarks and service marks;
- number of organizations performing research and development, units;
- research and development.

Of interest is the value of the pair correlation coefficient between v2 and v3: 0.96. That is, the number of innovatively active enterprises and internal R&D costs are interdependent variables with a close correlation. Finding a correlation between the costs of technological innovation and the share of innovative products in GDP showed that the relationship is positive, but not strong: 0.41.

The high correlation coefficients between the registration of patent applications and the grant of patents in Kazakhstan and the number of employees performing R&D, internal R&D expenditures, and the share of innovative products in GDP ($r = 0.95$, $r = 0.78$, $r = 0.81$) indicates the fact that the country has a favorable economic situation and an increase in the intensity of state regulation leads to an increase in scientific activity.

Let us analyze the above data on the introduction of innovations in the economy. The calculation results are shown in Table 4, which presents a matrix of correlation coefficients.

In order to analyze the interconnections between the GDP indicators, table 4 shows the paired correlation coefficients.

Table 4. Correlation matrix of indicators that characterize the introduction of innovations in the economy of the Republic of Kazakhstan

Variables		v 1	v 2	v 3	v 4	v 5	v 6	v 7	v 8	v 9
Number of employees who performed R & D, by form of ownership of organizations, thousand people.	v 1	1,00	0,80	0,91	0,81	0,73	0,62	0,95	-0,87	0,76
Number of innovative-active enterprises, units	v 2		1,00	0,96	0,84	0,72	0,87	0,87	-0,60	0,98
Domestic expenditures on research and development, million tenge	v 3			1,00	0,90	0,77	0,78	0,94	-0,75	0,94
Internal R & D expenditures from the public sector, million tenge	v 4				1,00	0,70	0,65	0,78	-0,78	0,83
Share of innovative products (goods, services) to GDP	v 5					1,00	0,41	0,81	-0,75	0,75
Expenditures on technological innovations of enterprises by ownership forms, million tenge	v 6						1,00	0,70	-0,45	0,85
Registration of trademarks and service marks and granting of patents	v 7							1,00	-0,81	0,86
Number of organizations that performed research and development, units	v 8								1,00	-0,59
Research and development	v 9									1,00

A strong but negative relationship between the number of organizations performing research and development and the rest (r = -0.87, r = -0.75, r = -0.81, r = -0.78), perhaps some organizations exist only nominally and their economic activity is minimal.

As is known, the pair correlation coefficient shows the degree of tightness of the relationship between only two variables under the indirect influence of other variables. That is, correlation analysis does not provide a complete picture of the relationships between variables.

The state as a whole supports the implementation of scientific developments of innovative implementations. This is confirmed by an increase in the real value of domestic research costs from the state budget. Despite the increase in state budget revenues, the number of organizations performing research and development is declining.

Conclusions

The analysis included: the number of employees performing R&D, by ownership of organizations; number of innovatively active enterprises; internal R&D costs; domestic R&D costs from the public sector; share of innovative products (goods, services) to GDP; costs of technological innovation of enterprises by ownership;

registration of trademarks and service marks; number of organizations performing research and development; number of scientific developments.

Thus, the statistical analysis showed:
- correlation analysis between two groups of indicators: a) GDP at current U.S. prices. dollars, Billions, b) internal R&D costs in dollars. The analysis showed that the patterns of change in the GDP of the economy in the period 2000-2018. domestic R&D costs are almost identical (0.7393);
- correlation-regression model of the impact of GDP on domestic R&D expenditures; the calculated correlation-regression model shows a strong positive effect of GDP on domestic expenditures on R&D;
- correlation matrix of indicators characterizing the introduction of innovations in the economy of the Republic of Kazakhstan. The analysis showed that between the pair correlation coefficients v2 and v3 is 0.96. That is, the number of innovatively active enterprises and internal R&D costs are interdependent variables with a close correlation;
- also in the study of indicators characterizing the introduction of innovations in the economy of the Republic of Kazakhstan, the relationship between the costs of technological innovation and the share of innovative products to GDP showed that the relationship is positive, but not strong: 0.41;
- high correlation coefficients between registration of patent applications and the grant of patents in Kazakhstan and the number of employees performing R&D in the period 2000-2018. domestic expenditures on R&D, the share of innovative products in GDP ($r = 0.95$, $r = 0.78$, $r = 0.81$);
- a strong but negative relationship between the number of organizations that performed research and development and the rest ($r = -0.87$, $r = -0.75$, $r = -0.81$, $r = -0.78$), perhaps some organizations exist only nominally and their economic activity is minimal.

Thus, based on the analysis, it is possible to formulate an innovation policy is an important, but not the only tool for managing GDP growth, which proves the research conducted in this article. Many studies of the impact of innovation on GDP dynamics show that the level of interconnection between innovation and the economic development of different countries varies.

The results of the study show that the country has a positive relationship between GDP growth and R&D expenditures. Analyzing the relationship between GDP growth dynamics and innovation variables in Kazakhstan, in most cases, one can observe a rather weak association of innovations and economic development. Certain measures were proposed that should be taken by the Kazakh authorities to stimulate innovation and economic growth. Based on the experience of technologically developed countries, the Kazakh government offers promising innovative policy measures to stimulate economic growth. It is important to ensure the proper level of growth in costs for technological innovations in order to enhance autonomy in Kazakhstan.

Abstract. At the present moment of society's development, the concept of Smart City development is attracting more and more attention. According to this approach, urban space should be implemented from the position of improving the quality of life of citizens. As part of the development of a smart city, rational and economical use of resources is assumed. This attitude to resources allows not only to save resources but also to improve the quality of life of the population, particularly by improving the environmental situation in the regions. In the world practice of developing cities, the recycling processes are becoming more and more relevant. On the one hand, this saves material and energy resources. On the other hand, these measures help to improve the quality of the environment in the regions. Recently, two concepts have become a trend in the development of urban economy in world practice. One of them is the concept of a smart city, the other is the concept of sustainable urban development. Despite a number of differences, both approaches to city management imply a focus on environmental friendliness. Implementing strategies of development of Russian cities in the framework of the concept of sustainable development and within the concept of smart cities aims to improve the environmental situation in the country. Therefore, the aim of the research was to improve the environmental potential of Russian regions through the use of modern Russian and foreign research, in particular through the tire recycling program. For Russia, one of the key environmental problems is the problem of recycling car tires. Despite the emergence of new eco-friendly ways of recycling tire waste, it is becoming more acute every year. This is understandable, because the number of cars increases every year. Currently, decommissioned tires are a source of environmental pollution in most of the Russian regions. However, this source of pollution is a long-term source. This is due to the fact that worn tires are practically not susceptible to natural decomposition, and, as a result, require increasing space for their storage and disposal. The article provides an analysis of the dynamics and prospects of car tire recycling in the framework of the concept of sustainable development of smart cities. A comparative analysis of the state of this issue in Russian and foreign practice is presented. In addition, according to statistic analysis, the article provides a forecast analysis of the increase in waste in the form of tires and an analysis of the regulatory framework governing the recycling process.

Keywords: smart city; sustainable city; circular economy; waste management; economic effect; resource-saving technologies; tire recycling

1. Introduction

According to the McKinsey Agency, there are about 200 smart cities in the world today. The most developed in this area include London, Singapore, Seoul, New York, Helsinki, Montreal, Boston, Melbourne, Barcelona, and Shanghai. At the same time, there are practically no Russian regions in the international smart city rankings, with the exception of Moscow, St. Petersburg, and Novosibirsk, which are also far from leading positions. At the same time, by the end of 2025, it is planned that there will be about 600 smart cities in the world (Urban world: Mapping the economic power of cities, 2011). This means that the number of smart cities in the world should increase by 3 times. This makes it necessary to develop approaches to creating and managing Smart City development as soon as possible (Machado, 2017).

The Ministry of construction of the Russian Federation has adopted a pilot project to create a Smart City on the basis of Russian cities. In addition, 8 Russian cities such as Krasnodar, Innopolis, Tolyatti, Novorossiysk, Sarov, Sochi, Voronezh and Magas are part of the International Smart Sustainable City Club (ISSCC).

However, today there is no clear approach to the concept of "Smart City". But having studied the world's leading practices, we agree that a smart city is a new approach to the implementation of urban space based on the use of digital technologies, based on the principles of:
- ✓ the open space;
- ✓ management transparency;
- ✓ involvement of citizens in the management process;
- ✓ improving the quality of life (Saptadi *et al.*, 2019).

Smart city combines several elements such as:
- ✓ smart environment (renewable energy, resource saving, etc);
- ✓ smart mobility (transport networks, smart parking, wifi coverage, etc.);
- ✓ smart lifestyle (comfortable structure of the city, health saving technologies, etc.);
- ✓ smart people (educated, able to participate in urban processes using ICT).
- ✓ smart economy (Saptadi *et al.*, 2019).

Thus, a "smart city" is a city that strives to ensure sustainable development in all plans (economic, social, political), as well as a high quality and standard of living with reasonable management of natural resources and the environment, while using digital and information technologies, data collection, processing and analysis technologies, as well as technical solutions and appropriate infrastructure (Novikov *et al.*, 2019; Rostova *et al.,* 2019).

Thus, one of the important elements of forming a smart city system is the rational use of resources, which allows to save resources, as well as improve the quality of life, including by improving the environmental situation in the regions (Sienkiewicz *et al.*, 2017).

In the world practice of developing smart cities, recycling processes are becoming more and more popular. On the one hand, this saves material and energy resources. On the other hand, this makes it possible to improve the quality of the environment in the regions (Ahvenniemi *et al.,* 2017).

One of the key environmental problems in Russia is the problem of recycling car tires. It is becoming more acute despite the emergence of new eco-friendly ways to dispose of them. This is due to an increase in the number of cars.

However, similar problems are not unique to Russian cities. In this regard, it becomes very relevant to analyze the current state, as well as to identify the prospects for the development of municipalities from the perspective of sustainable development of smart cities.

Thus, the goal of the research is to increase the environmental potential of Russian cities within the framework of the implementation of the concept of sustainable development and the concept of smart cities, in particular through adequate utilization of tire waste.

The following problems should be resolved to achieve the goal:
1. Analysis of international urban development practices in accordance with the concept of sustainable development and the concept of a smart city from the point of improving the environmental component, in particular through adequate utilization of tire waste.
2. Identification of trends in tire waste disposal in international and Russian practice with a focus on sustainable development of territories.
3. Detection of the potential for the development of Russian cities in the framework of the concept of sustainable development and the concept of smart cities based on the analysis

2. Theoretical Framework and Literature Review

Countries are increasingly faced with the need to improve the efficiency and competitiveness of their economies. This is due to hyper-competition in the global market. However, for further development of production, it is necessary to increase the consumption of resources. This causes a huge increase in production waste. This becomes critical for the future existence of the society.

A similar problem was raised by Ahvenniemi et al. (2017). They note that, as expected, modern cities place much more emphasis on modern technology and "smartness" compared to urban sustainability concepts. At the same time, they emphasize that the environmental component is also important in the development of the smart city concept. In addition, they note that it is extremely important that when assessing the effectiveness of a smart city, not only indicators of the effectiveness of smart solutions are used, but also impact indicators that measure the contribution to the achievement of final goals, such as environmental, economic or social sustainability.

The need for a symbiosis of the concepts of "smart" and "sustainable" urban development is considered by Nižetić *et al.* (2019). In their opinion, it is intellectual technologies that will allow society to have a sustainable future. The main goal of modern society is sustainability and reasonable use of limited and valuable resources. However, as the authors note, there are completely different approaches and standards to sustainable development in society, which depend on geographical, temporal and cultural aspects.

Analysis of the current state of cities in the framework of two concepts "smart city" and "sustainable city" is considered in the study of Shmelev and Shmeleva (2018). This research analyzes more than 90 cities around the world. The results of the study showed that San Francisco leads in economic and environmental priorities, while Stockholm leads in social and smart urban priorities. Seoul is performing well across the entire spectrum of indicators.

Zhang et al. (2019), looking at the example of the Chinese economy, note that, of course, it is necessary to create a new type of management thinking aimed at the transition to a "circular economy with zero waste" (Zhang *et al.*, 2019). They note that this is particularly relevant for China. At the same time, the study says that this problem is extremely complex, because it involves many stakeholders. The research highlights twelve important barriers to intelligent waste management in China. Among the strongest barriers, the authors highlight "the lack of regulatory pressure, the lack of environmental education and culture of environmental protection, as well as the lack of market pressure and requirements." Also, among the problems mentioned are smart waste management, the lack of a legal framework for mandatory waste disposal, and economic and financial problems related to the lack of funding.

Similar barriers to spreading the concepts of a "smart" and simultaneously "sustainable" city are noted in the work of Zhang et al. (Zhang *et al.*, 2018).

Thus, it is clear that the creation of smart solutions for the organization of urban economy does not always provide for the environmental sustainability of these solutions.

For example, increasing transport accessibility as part of the development of the smart city concept, and the influx of people to these cities lead to an increase in the number of cars. This creates a problem associated with the disposal of failed cars and their parts.

The problem of increasing waste in the form of automobile tires has affected all developed countries. At present, this problem is receiving a lot of attention, both from the scientific community and from Governments.

At the same time, tire waste can be a good source of raw materials (Fagundes, 2017). This will not only solve environmental problems but also save financial resources.

So in their research Sienkiewicz et al. (2017) came to a number of conclusions based on a comprehensive review of changes in policies and approaches to tire recycling. First, the recycling and restoration of tires is a serious environmental problem due to their very complex structure and composition. Secondly, the governments of many countries are interested in developing new technologies for environmentally friendly recycling of tires. They note that there has been significant progress in sustainable waste management recently. This new approach is already being applied in the US, China, Japan and the EU. Also, the authors' note that used tires should not be considered as a pollutant, but as a source of materials.

Sienkiewicz et al. (2017) remark that already known technologies can be used for recycling tire waste. Thus, these measures do not require significant investment. But at the same time, they allow for "sustainable and clean recycling". It's good for both concepts - "smart city" and "sustainable urban development".

Gupta et al. also focused on waste recycling from the perspective of economic development (Gupta et al., 2019).

In their research Pereira et al. (Pereira *et al.*, 2018), based on data from Brazil, tried to deduce the correlation between the number of tires coming for recycling and external factors. This research assumes forecasting the percentage of utilization under different conditions.

A large group of scientific papers is devoted to the re-use of waste. In particular, considering tire waste as raw materials. The work notes that on the one hand, proper recycling of tire waste will reduce the level of environmental pollution, and on the other hand, will allow you to get an additional economic effect.

Thus, in their article, Arulrajaha et al. (2019) note that used tires are indeed a big problem for sustainable urban development. At the same time, they suggest using this raw material as the basis for road pavement (sidewalks). They say that the increased strength of this type of coating. This approach also fits well into both the concepts of "smart city" and "sustainable urban development".

Similar conclusions were reached by Wang et al. (2019). The rapid growth in the number of cars in China has generated an increase in tire waste. At the same time, it is noted that currently 62.8% of tire waste is not processed in China. As a solution to the problem with recycling, the authors proposed adding rubber crumbs to the asphalt concrete pavement. They note that this will "contribute to the sustainable management of worn tires." And the use of crumb for asphalt production will be on the one hand "an effective method of balancing the contradictions between the supply and demand of rubber crumb", and on the other hand will significantly reduce carbon emissions into the atmosphere. In addition, the authors note that this data will reduce the dependence on non-renewable resources in the production of asphalt.

Thus, urban management in the context of the implementation of two concepts at once: the concept of "Smart city" and the concept of "Sustainable urban development", of course, should become a driver of development.

However, there are factors that negatively affect the implementation of these concepts.

Ghosh et al. (2019) note that there are already many promising technologies for processing various types of waste. These technologies fully correspond to the concept of smart cities development. However, these methods are either not used at all, or are not fully used. This is particularly true in developing countries.

The same opinion is present in the work of M. Maryono and I. Hasmantika (2019). They believe that a number of technologies developed in advanced countries still cannot be applied in "cities of developing countries" because of their complexity. In addition, the authors note that the lack of environmental education of the population, as well as the lack of regulatory documents on waste disposal and recycling, greatly affects the development of cities within the framework of the concept of a smart and sustainable city.

Dong and Fujita (2015) note that it is difficult for society to balance economic growth with a low level of environmental pollution, in particular waste from burning tires. They note that in the framework of the development of society it is necessary to rely on the practice of Japanese cities with low carbon emissions. It focuses on two national initiatives: the eco-city project and the smart city project. The authors believe that applying this practice to Chinese cities will dramatically reduce carbon emissions into the atmosphere.

3. Materials and Methods

3.1. The importance of tire recycling in the in the Russian Federation

Currently, decommissioned tires are a source of environmental pollution in most of the Russian regions. However, this source of pollution is a long-term source. This is due to the fact that worn tires are almost not susceptible to natural decomposition. As a result, they require more and more space for their storage and disposal.

Today, there are certain strategies for dealing with worn tires. The most common ones are:
- reuse;
- export;
- recovery;
- mechanical processing;
- thermal processing;
- burial.

However, the latter two approaches are not acceptable within the framework of the concept of sustainable regional development, as well as the concept of Smart City, which implies significant attention to environmental issues.

According to statistics, only about 20% of used tires are recycled in Russian regions (Rostova *et al.*, 2019).

At the same time, worn tires are an excellent source of recyclable materials. They contain rubber, carbon black (almost pure carbon), metal and synthetic cord. In this case, the rubber is 70% of the weight of the worn tire. (Wang *et al.,* 2020).

If incineration is used as a measure to dispose of tires, a large amount of toxic waste is released into the atmosphere. These emissions are several times higher than when burning coal (table 1), which also completely contradicts the concept of "smart cities" development:

Table 1. Emissions of pollutants into the atmosphere

Pollutant	Coal combustion	Burning of worn tires
Sulfur, %	2.00	1.3–2.2
Ash, %	11.30	12.5–18.6
Chlorine, %	0.14	0.20
Zinc, particles per million air particles	27.20	9300–20500
Chrome, particles per million air particles	20.50	97.0
Nickel, particles per million air particles	16.90	77.0
Plumbum, particles per million air particles	8.30	60–760
Cadmium, particles per million air particles	0.91	5–10

Source: compiled by the authors based on (Rostova *et al.*, 2019)

Thus, the problem of recycling worn-out car tires is a common problem that faces all industrialized countries. The solution to this problem is of great environmental and economic importance (table 2).

Table 2. Value of tire recycling in the context of the Smart City concept

Value	Essence
Environmental	✓ Tires that are located for a long time in organized landfills or on other territories are a source of environmental pollution. ✓ They have a high degree of fire hazard. ✓ In the case of burning tires, the process is accompanied by emissions (about 150 different toxic compounds), which are dangerous to human health and the environment.
Economic	✓ Worn tires are a valuable resource. At the same time, tire recycling becomes a priority task in conditions of resource constraints. Recycled raw materials can be reused in various areas of production. ✓ The elimination of tire dumps allows for the release of significant land areas for their more rational use.

Source: compiled by the authors

In this regard, the issue of improving the quality of life, as well as issues of resource-saving technologies, which have become relevant in the context of the irreplaceability of material resources, become a priority in the development of the concept of smart cities.

3.2. Analysis of foreign experience in tire waste disposal

The number of cars on the planet is growing rapidly (figure 1), and the dynamics is exponential. Accordingly, the amount of waste generated increases in proportion to the increase in the number of vehicles. Over the past 20 years, the number of worn tires has increased by about 2 times (Novikov *et al.,* 2019).

Figure 1 confirms that the challenge of recycling used tires is currently a much bigger problem for Russia than for developed foreign countries. Over the past 20 years, the number of passenger cars in Russia has increased by more than 3 times. Consequently, the number of tires in need of recycling has increased proportionally.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810
Fig 1. Dynamics of the number of vehicles
Source: compiled by the authors based on (Novikov *et al.,* 2019)

At the same time, the global amount of tire waste according to various estimates ranges from 60 to 80 million tons. The annual increase is approximately 10 million tons of tires (Novikov *et al.,* 2019). Thus, the annual growth rate exceeds 10%. Only in the US, 4.3–4.5 million tons of worn tires are produced per year, in Europe-up to 3 million tons, in Japan – about 1 million tons (Novikov *et al.,* 2019).

However, this is not the case in all countries. For example, in developed countries: Japan, Germany, and the Scandinavian countries, the recycling rate of tires is approaching 100%. If we talk about Europe as a whole, we have determined the average utilization rate, which exceeded 76%, based on table 3 (table 3).

Table 3. Analysis of tire recycling in Europe

Country	Number of tires, million tons	Tire recycling, million tons			Tire recycling, %	Rank

Source: compiled by the authors based on (Annual tire recycling report for Europe, 2017)

Analyzing the table data, it can be concluded that in countries such as Cyprus, Malta, and Switzerland there is no recycling production. First of all, this is due to the fact that these States are small and all tires that have failed are exported.

If we analyze the most popular tire recycling strategies used in Europe, we can note that only about 1% of the volume is disposed of (figure 2) (Kolganova, 2018). The most popular type of processing is the production of rubber crumb, which is later used for economic purposes, for example, for the manufacture of road surfaces.
Fig. 2. Strategies for managing worn tires in Europe
Source: compiled by the authors based on (Kolganova, 2018)

To sum up, it should be noted that thermal and mechanical processing are the most popular in Europe (figure 2). In addition, for most developed foreign countries, old tires are a source of valuable raw materials that are usually processed. This is fixed not only in normative documents, but primarily in the minds of the population. If we talk about the legal regulation of the process of recycling tire waste, it should be noted that in Europe, the treatment of worn tires is regulated by three main regulatory documents. By analyzing the international experience of waste tires, it becomes clear that the creation of an effective system of collection and further processing components, the active position of the state in this matter: regulation of the issue at the legislative level, the provision of subsidies to organizations involved in recycling, creating conditions to increase the attractiveness of the sector for its participants (Zvonov *et al.*, 2000). If we talk about the financial side of the issue of recycling of worn tires, there are currently three models for financing the disposal of worn tires in the European Union (table 4).

Table 4. Systems for financing the recycling of used tires in Europe

System	Principle of functioning	Countries that use this system
Tax System	As part of this system, the state introduces tax payments, which serve as the main source of subsidies for processing industries.	Hungary, Denmark, Slovakia, Latvia
Producer Responsibility	Responsibility for disposal lies with the suppliers. The source of financing for recycling processes is a fund to which tire manufacturers transfer money depending on the amount of revenue, including these costs in the cost of new tires.	Sweden, Norway, Finland, Portugal, Poland, France. The transition to this model is expected in Great Britain, Spain, Hungarians.
Free Market System	Each tire owner independently selects counterparty for tire recycling. This model works effectively only in countries with a high standard of living and a level of civil responsibility of the population.	Germany, Italy

Source: compiled by the authors based on (Zvonov *et al.*, 2000)

Today in Europe there are about 40 different companies involved in the recycling of old tires. The main goal of these companies is to collect and process tires in a quantity that would be comparable to the production of new tires. The principle that applies in Europe is "one new tire is sold – one old tire is recycled".

Figure 3 shows the dynamics of tire recycling in European countries. The figure shows that the trend of tire recycling is linear and increasing.
Fig. 3. Dynamics of car tire recycling in Europe
Source: compiled by the authors based on (Rostova *et al.*, 2019)

Considering the issues of tire recycling in the United States, it should be noted that almost all States have adopted special laws and programs that regulate the management of tire waste. It is clear that each of the States has its own nuances regarding tire recycling. However, several similar principles can be identified in the analysis:

✓ financial support for tire recycling is provided by taxes and fees. For example, the amount of payment for the recycling of tires varies from 0.5 to 2$ for passenger car tires, and from 3 to 5$ for a truck;
✓ tire recycling activities (assembly and processing plants) are subject to licensing;
✓ participants in the recycling process: sorters and processors are provided with financial guarantees (Kolganova, Gubanova, 2018).

The Japanese tire recycling system is more than 18 years old. Currently, the country of the rising sun has a "law on waste recycling", according to which every citizen is obliged to personally deliver worn-out tires to the places where they are collected. At the same time, the recycling fee is 300 yen, which in terms of the Russian ruble is about 174 rubles. In parallel, in Japan, there is a law that imposes responsibility for the collection and disposal of tires on the manufacturers of new tires themselves. At the legislative level in Japan, it is stipulated that the reuse of resources obtained during recycling should be at least 70%.

Analyzing the experience of tire recycling in Europe, Japan and the United States, we can draw the following conclusion: regulation of this issue by the state and responsibility, as well as the proactive position of citizens in relation to waste disposal, contribute to the development and effective operation of the industry of recycling old tires. Adopting the experience of the above-mentioned countries, you can achieve both economic benefits from organizing and conducting business activities in the field of recycling broken tires, and improve the environmental situation by recycling unnecessary waste.

3.2. Analysis of Russian experience in tire recycling

Currently, two concepts of urban development are applied in the Russian Federation: the concept of sustainable development, and the concept of smart city. One of the key aspects of these concepts is to improve the environmental situation in the country. Particularly, one of the most important environmental problems is environmental pollution due to the constant increase in tire waste. Therefore, recycling tires is a priority task in the sustainble development of the concept of smart cities in the Russian Federation. It not only reduces the consumption of material resources, but also is a priority in the development of environmental protection and environmental measures. Worn-out tires are subject to the Federal law of the Russian Federation of 1998 No. 89-FZ "on production and consumption waste". It is a waste of the fourth class of danger.

At the same time, the percentage of tire recycling in Russia is much lower than in European countries (Chistov, Pavlov, 2014). It is currently around 5% to 20% according to various estimates (Stets, Chaykun, 2013), while in Europe this figure is approaching 80%. According to "Shinoecology" data (Kolganova, 2018), about 1 million tons of worn-out tires are produced annually in Russia, the change in the dynamics of this indicator is shown in table 5.

Table 5. Estimation of the total number of tires for recycling in the Russian Federation

	The volume of waste tires in Russia, thousand tons	Utilization	
		thousand tons	%
2016	800.0	–	–
2017	729.0	30	3.75
2018	800.0	36	4.50
2019	800.0	70	8.75

Source: compiled by the authors based on (Kolganova, 2018)

The dynamics of growth in the number of tires is still maintained at the present time, as can be seen from figure 4. Moreover, both tires produced in the country and imported tires are subject to recycling on the territory of the Russian Federation. At the same time, as can be seen from figure 5, the share of both tires is growing every year. Moreover, if the trends continue, by 2021 the number of tires imported and produced annually in the Russian Federation will increase by almost 2 times. This makes recycling even more necessary (Shmelev *et al.*, 2018).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810
Fig. 4. Analysis of the dynamics of the increase in the number of tires on the territory of the Russian Federation
Source: compiled by the authors based on (Shmelev *et al.*, 2018)

One of the main reasons for the growth of tire production is the increase in the provision of individuals and legal entities with vehicles. Thus, according to the analytical Agency "AUTOSTAT" at the beginning of 2018, the provision of passenger cars in the Russian Federation on average amounted to 290 units per 1000 residents (Rostova *et al.*, 2019). This figure is twice the global average. However, it is significantly lower than the indicators of developed European countries. Almost every second Russian family has a private car, and every sixth has two or more of them.

Clearly, with an increase in the number of cars purchased, the number of tires purchased increases in direct proportion. At the same time, the climatic features of our country force us to purchase 2 types of rubber: for summer and winter time.

At the same time, in Russia, despite the state's policy to improve the environmental situation, citizens have formed an uncompromising attitude to secondary raw materials: for most Russians, this is just garbage, the recycling of which seems useless. In Russia, millions of old tires have accumulated, both in legal and illegal dumps. They are thrown along roadsides, on vacant lots, in courtyards, in forests, even used as fencing for flower beds (Grafkina, Mikhailov, Ivanov, 2009).

However, the transition to the concept of smart cities and the resulting increased attention to environmental issues have given rise to a number of legislative documents, including the decree of the Government of the Russian Federation dated December 28, 2017 No. 2971-R "on approval of standards for waste disposal from the use of goods for 2018-2020". In this document, the following standards for tire recycling were set for the group "Tires, tires and rubber chambers": 2018 – 20%, 2019 – 25%, 2020 – 30%.

However, based on the analysis, it was revealed (table 6) that the plan approved in the decree about tire recycling was not fulfilled.

Table 6. Analysis of the implementation of the tire recycling plan

	Utilization		Planned percentage of utilization according to Decree, %	The percentage of the plan for recycling tires, %
	thousand tons	%		
2017	30	3.75	–	–
2018	36	4.50	20.0	22.5
2019	70	8.75	25.0	35.0

However, despite the fact that the standard for recycling tires in the Russian Federation has been increased by law, the situation still continues to be quite tense. Because the gap between standards and Western countries is significant – in Europe, this figure is approaching 80% (table 3).

Based on the analysis of the trend in the standard of tire recycling in Russia, if the rates set by the Government order are maintained, the Russian economy will be able to reach the average indicators of developed Western countries in 13 years, that is, by 2030.

3.4. Economic aspects of tire recycling in the Russian Federation

It is clear that the adoption of the law on mandatory tire recycling raises a number of issues related to the financing of this event.

To solve this issue, Russia, by analogy with the leading Western countries, has introduced a recycling fee. Moreover, this fee is imposed in general on the purchase of a car, as well as on tires.

At the same time, the recycling fee is understood as a one-time payment in favor of the state, which is used to take environmental safety measures and protect human life and health from harmful emissions during the operation of the vehicle.

Speaking about vehicle recycling in General, then the payment of the recycling fee is regulated by the Federal Law "About production and consumption waste". The law provides for mandatory payment of a recycling fee when purchasing a car.

The amount of the recycling fee required for payment when purchasing a vehicle is calculated by multiplying the base rate by the calculation factor.

Talking about the amount of the base rate present in the formula for calculating the recycling fee, it varies depending on the type of vehicle and is:
- ✓ for non-commercial passenger cars – 20,000 rubles;
- ✓ for commercial passenger cars, as well as trucks and buses – 150,000 rubles.

The coefficient for calculating the amount depends on the year of manufacture of the car (other vehicle) and its parameters: size, weight, engine volume, and is regulated by the Decree of the Government of the Russian Federation No. 1291 of 26.12.2013.

The second direction is to receive a recycling fee from tire manufacturers. These companies are currently required to pay for recycling, as used car tires and cameras were included in the "list of types of production and consumption waste, which includes useful components, the disposal of which is prohibited" from January 1, 2019. The payment is different for the regions of the Russian Federation, so in Chelyabinsk they pay for the disposal of 1 ton of tires – 2000 rubles, in Krasnodar – 3500 rubles.

Recycling tires can be an important source of resource savings. So, if the weight of rubber is 70% of the weight of a worn tire (Afinogenov and et. al, 2016), then if the total volume of tires is processed, which in Russia is about 1 million tons per year (figure 4), you will get about 700,000 tons of rubber.

The saved raw materials can be used as raw materials for rubber products, construction materials, for example, can be used as road pavement.

At the same time, if you continue to burn worn tires, it is necessary to understand that 270 kilograms of soot and 450 kilograms of toxic waste will be released into the atmosphere (Afinogenov and et. al, 2016) per 1 ton of raw materials burned. If we assume that the entire volume of tires in Russia will be disposed of by incineration, then 270 million tons of soot and 450 million tons of gases will be released into the air.

These figures do not fit into the concept of smart cities. In this regard, the first place goes not only to the disposal of tire waste, but also to the use of environmentally friendly methods of their disposal.

4. Conclusions

According to the analysis of the international experience of urban development in accordance with the above concepts, one of the key areas of implementation of the concepts is the environmental aspect.

Almost all researchers agree on the need to resolve the issues related to waste disposal, which increases with the quality of life. Along with this, everyone notes the need to resolve issues with the growth of tire waste.

Despite the beginning of the implementation of sustainable development and smart city concepts, today Russian cities have much more significant issues than European ones. Based on the analysis, only about 20% of these wastes are currently disposed of, while in European countries this value is more than 80%. This discrepancy leads to the need to apply international experience in solving the problem of tire waste disposal in Russian cities.

For example, analyzing the European experience, experts say that the model of "manufacturer and importer Responsibility" for tire recycling, which is used in most European countries that were able to completely free their territories from the rubble of worn tires in 10-15 years, should be applied in our country.

There are several main reasons for the existing of problems with utilization of automobile tires in Russia, among them: the lack of a developed market for collecting tires, and the lack of a market for the sale of products for processing worn tires.

At the same time, modern Russia is only developing in this area. Until recently, the state did not encourage the work of enterprises related to the handling of tires (collection, transportation, storage and processing). Car rubber processors were left to their own devices, as their activities were not regulated, and this type of activity is quite risky. But recently, a number of bills have been passed that have greatly improved the situation in this type of business. In addition, leasing companies are willing to work with equipment for recycling tires, which also has a positive effect on the activities of organizations.

Taking into account eco-friendly ways of recycling tire waste is becoming one of the important directions in the transition of Russian cities to the concept of Smart City".

Abstract. Saving energy at workplaces has become a major concern in enterprises because it offers a valuable opportunity to reduce energy consumption and lessen carbon dioxide emissions, which affect the global climate change and human health. This study integrated and extended both theories of planned behavior and social information processing to identify key determinants that influence on middle managers' energy saving intention at workplaces. By using the Partial Least Squares-Structural Equation Modeling (PLS-SEM) method to scrutinize a data survey of 336 middle managers in small medium enterprises located in Ho Chi Minh City (HCMC), Vietnam. The findings confirmed the central role of top management support in stimulating middle managers to engage in energy saving responsibility. Moreover, under social pressure, managers are willing to change and enhance subordinates to reduce energy consumption. Meanwhile, perceived environmental responsibility has a significant indirect impact on energy saving intention through proactive behavior, but not a direct impact. Based on the results, this study enriched the literature on energy saving behavior and drew managerial implications for enterprises

Keywords: energy saving intention; social pressure; top management support; proactive behaviour; openness toward change; perceived environmental responsibility; SMEs

1. Introduction

The worldwide energy consumption has been rapidly increasing over the last decade (Zhang, Wei, and Zhou, 2018). The International Energy Agency reports that the demand for energy is forecasted to rise by nearly 35% from present until 2035 (Tan, Ooi, & Goh, 2017). Consequently, energy prices have gone up, meanwhile the world energy supplies have been unstable (Bissing-Olson et al., 2013; Tang, Warkentin, and Wu, 2019).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Moreover, the fast rising energy consumption has caused numerous environmental problems as well as enhanced the global climate change, which has obstructed sustainable development. As one of the most dynamic emerging countries in East Asia region, Vietnam has increased energy demand by 10% per year. In reference (Le, 2019), the current energy consumption is extremely inefficient. Electricity consumption has surged by nearly 13% per annum. The demand for generation capacity increased from 8.7 GW in 1990 to 27 GW in 2000 and achieved greater than 48 GW in 2018. Primary energy consumption increased from 31 million tons of oil equivalent in 2005 to around 75 million tons in 2017.

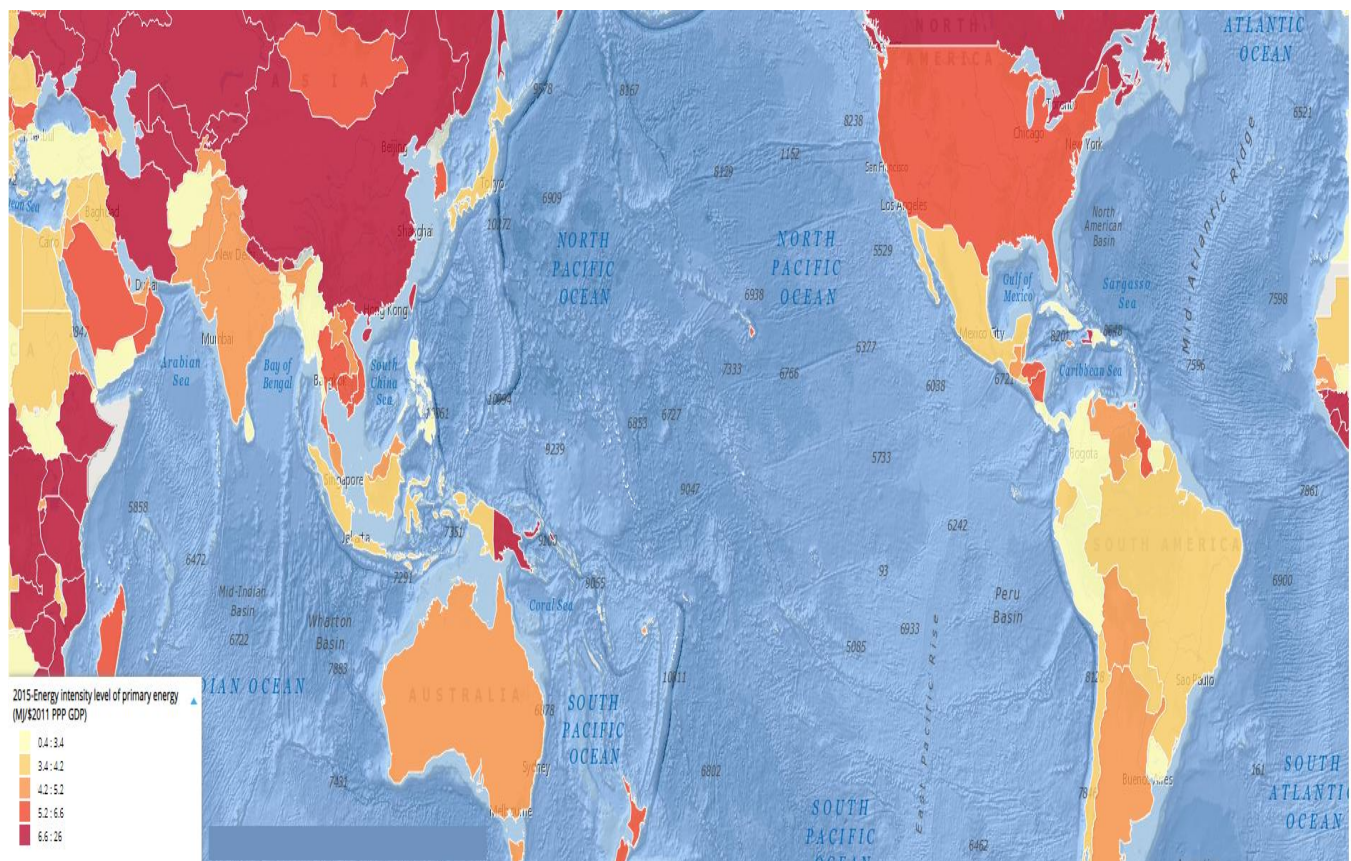
As the process of fundamental industrialization is attained, the structure transformation process transits gradually to high-efficiency industries with less energy consumption, and economic growth of countries impels decrease in the energy intensity of Gross Domestic Product (GDP) (Burke & Csereklyei, 2016). Accessing to World Bank database (World Bank, 2019), the quantity of primary energy in terms of (MJ) per GDP (2011 PPP) presented in Figure 1. In 2015, Vietnam's energy intensity was 5.9, which is higher than in India (4.7) and other ASEAN (such as Malaysia (4.7), Singapore (2.4), Philippines (3.1), Indonesia (3.5), Thailand (5.4), Myanmar (3.1), Lao (5.2)). It implies that Vietnam has been using highly energy for a unit of economic output. The main concern is that the increase in energy consumption induces higher carbon dioxide (CO_2) emissions and other greenhouse gasses, which affect the global climate change and human health (Tang et al., 2019; Wang, Zhang, and Li, 2014).


Figure 1. Primary energy (*Source:* World Bank)

In the other side, pursuing the environmental protection programs is adversely diminishing the profitability of many companies (Scherbaum, Popovich, & Finlinson, 2008), thus researchers and practitioners are seeking for solutions lessen energy consumption at workplaces (Gao et al., 2017; Leygue, Ferguson, and Spence, 2017; Tang et al., 2019; Zhang, Wang, and Zhou, 2014). The academic literature proposes that to reduce energy consumption at workplaces, companies seek for transforming organizational structure and changing operations management such as investing in energy-efficient equipment (Scherbaum et al., 2008). However, purchasing energy-efficient products and enhancing efficient energy use are not enough to reduce energy consumption in long periods of time due to the so-called "rebound effect" (Chitnis et al., 2013; Gao et al., 2017). When using energy-efficient machinery, people seem to consume more electricity. For instance, people may turn on an air condition for longer hours or set a lower temperature since they believe in new technology for greater energy savings.

Because of this puzzlement, energy saving behavior has attracted into an emerging research field. According to Scherbaum et al. (2008), enterprises and their workers are one of the numerous users of the global energy. Various enterprises have recognized the significant role of managers and employees in saving energy at workplaces and searched for guidance procedures to ensure employees stay proactively engaged with energy saving (Zhang et al., 2014). However, many present studies on energy saving behavior at the individual level primarily concentrated on energy saving of households (Liu et al., 2020; Wang, Lin, & Li, 2018; Yue, Long, & Chen, 2013). Whereas other prior studies largely explored customers' attitudes toward using energy efficiency (Gadenne et al., 2011; Hua and Wang, 2019). In addition, the present literature on energy consumption at workplaces substantially focuses on employee energy saving behavior (Tang et al., 2019; Zhang et al., 2014). A research gap still exists in examining the role of middle managers in energy consumption behavior in Small Medium Enterprises (SMEs), although the many attempts have been conducted to bridge it. Enterprises expect employees, particularly middle managers, devote more effort as well as engage change-oriented behaviors (Griffin, Parker, & Mason, 2010). By pursuing innovative ideas and initiating and implementing changes, managers have to seek for appropriate solutions to reduce energy consumption and adapt to new environmental laws, as well as overcome particular challenges to keep their job. Thus, we investigate which determinants lead to middle managers' proactive behavior and energy saving intention at workplaces.

Extant research on the energy saving at workplaces has largely concentrated on employees' attitude and exercised the conceptual framework based on the theory of planned behavior (TPB) (Ajzen, 1991) to clarify energy saving behavior of employees (Gao et al., 2017). Other studies extended rational choice theory to illustrate that energy saving behavior of employees is based on the cost-benefit analysis (Leygue et al., 2017; Zhang et al., 2014). In addition, in the recent study, Bao, Wang, & Sun (2019) employed social information processing theory to evaluate the mediating role of middle managers in adapting environmental regulations and implementing proactive behavior at workplaces. Meanwhile, another study of Tang et al. (2019) employed stimulus-organism response theory to develop the research framework. The scholars attempt to identify the factors motivating employees' energy-saving intention. In this study, we integrated and expanded both theories of TPB and social information processing to develop the conceptual framework to answer the key research question above.

This paper makes several essential contributions to our knowledge of this crucial phenomenon. First, it examines the determinants that lead middle managers' energy saving intention in SMEs, hence this research field has been extended in the new context. Second, while most previous research mainly employed one of common theories (e.g. TPB, rational choice theory, stimulus-organism response, and social information processing), this paper integrated and extended both theories to clarify the central role of top management support in connecting explanatory factors (e.g. social pressure, openness toward change, proactive behavior) that influence on middle

managers' energy saving intention. Finally, this research is expected to provide fruitful insights to assist policymakers to stimulate middle managers to engage in energy saving responsibility.

The remaining of this paper is structured as follows. The following section reviews the prior literature on energy saving intention and relevant theories to build the research model. Then, Section 3 describes the research methodology and data collection. Data analysis and empirical results are presented in Section 4. In Section 5, we discuss the research findings and highlight theoretical and managerial contributions. The final section presents conclusions with the limitations.

2. Literature review

2.1. Energy saving intention
Many technical solutions have been created to reduce energy consumption that behavioral changes have substantially favorable influences on decreasing carbon emissions and fighting global warming (Tang et al., 2019; Zhang et al., 2018). Therefore, the behavioral trend has appealed immense attentions from scholars in the current period. Previous studies of energy-saving behavior has concentrated on individual settings (Al-Shemmeri and Naylor, 2017; Gao et al., 2017), instead of companies' energy-saving behavior. Several studies have also attempted to investigate how socio-demographics and psychological factors relate to energy-saving goals. For instance, in reference (Ding et al., 2017), it illustrated that urban residents in China are more likely to engage in energy-saving activities than rural residents. Likewise, another study in China showed that females paid more attention to energy saving than male due to the Chinese family culture, wives are often responsible for controlling household expenditure (Yang, Zhang, & Zhao, 2016). In addition, other studies investigated the linkage between energy saving behavior and psychological factors by examining specific variables of psychological components (e.g. attitude, values, beliefs, and social norms) (Frederiks, Stenner, & Hobman, 2015; S. Wang et al., 2018).

In recent studies, scholars have also started to investigate the determinants of employees' energy-saving behavior at workplaces (Gao et al., 2017; Tang et al., 2019). They have explored the possible influences of employees' socio-demographics and psychological components on energy-saving behavior. For instance, by conducting a questionnaire survey from United Kingdom college employees, the scholars found that socio-demographic features, such as commute category, social altruism, homeowner status, and use of home green appliances, affected employees' commitment to actual energy savings at workplaces (Al-Shemmeri & Naylor, 2017). Another study on Chinese office workers proved that worker's attitude, perceived behavior control, descriptive and personal moral norm have a significantly positive impact on energy-saving behavior (Gao et al., 2017). Similarly, by analyzing data from Chinese office employees, Tang et al. (2019) found that energy saving intention had a positively significant relationship with both employee's social pressure and perceived energy saving responsibility.

2.2. Top management support
Top managers are responsible for making the organizational decisions, are critical for organizational. Several prior studies have examined the effect of top managers on companies' energy-saving behavior. For instance, Blass et al. (2014) analyze data collection from top operations managers of small medium manufacturing firms in the United States. They find that the top operations managers' engagement significantly raises the adoption energy-efficiency initiatives. Whereas, Zhang, Wang, and Lai (2015), conducting a data survey of senior managers from industrial firms in China, show that senior managers' environmental concern mediates between firms' operational practice and energy-saving strategy.

According to Schumpeterian viewpoint of competition, companies are able to gain competitive advantages over time by executing actions (Jacobson, 1992). Environmental management activities are a kind of actions that companies can execute to achieve a sustainable competitive advantage (Dai, Montabon, & Cantor, 2014). Therefore, under the competitive pressure, company leaders should support for the environmental initiatives to gain a competitive advantage. Moreover, Zhang et al. (2018) show that top management support has a significant impact on energy-saving behavior. In addition, executing environmental initiatives requires many resources such human, capital, technologies. With the top management support, these resources are given to a remarkable extension. So, the first hypothesis was proposed:

H1. Top management support is a positive influence on energy saving intention.

2.3. Social pressure

Social pressure, one type of the subjective norms, confers to the pressure level of an individual perceived from essential others to carry or not carry the behavior (Frederiks et al., 2015; Tang et al., 2019; Wang et al., 2018). It means that if an individual perceives the substantial other people such as friends, colleagues, leaders, or relatives, expect him or her to pledge a specific behavior, he/she is more likely to employ the behavior. When managers have to perform four primary functions such as planning, organizing, leading and controlling at workplaces, they may feel more pressure not to do the right things under social pressure on environmental management activities. Therefore, they may create some approaches to motivate employees to reduce energy use in the workplace. They also face social pressure to commit to solve societal and environmental problems. Specifically, top-level managers want to follow opportunities and strategies that deal with environmental and social factors to gain sustainable development (Jahanshahi & Brem, 2017). Previous empirical results showed that social pressure is a key determinant of energy saving intention (Wang et al., 2018; Yue et al., 2013). In the recent empirical study on Chinese office workers, Tang et al. (2019) find that social pressure is positively associated with energy saving intention in the workplace. Another recent study on 207 families in northwest China also finds out that subject norm has a significant influence on energy saving intention at home. Hence, the following hypotheses were proposed:

H2. Social pressure has a significant effect on energy saving intention.
H3. Social pressure is a significant effect on top management support.

2.4. Proactive behavior and openness toward change

Proactive behavior is broadly defined as "taking initiative in improving current circumstances or creating new ones; it involves challenging the status quo rather than passively adapting to current conditions" (Crant, 2000). General components of proactive behavior involve actively searching out information, determining room for improvement, establishing constructive change-oriented recommendations and figuring out appropriate ways to improve a circumstance (Bao et al., 2019). This paper explored perceptions of environmental regulation. Middle managers need to change their attitudes and behaviors to comply with the environmental laws and regulations. Based on social information processing theory, middle managers are supposed to be more open to change, particularly since environmental laws stimulates middle managers to acknowledge the need for change (Bao et al., 2019).

Previous studies have shown that proactive behavior has a strong linkage with individual and organizational outcomes such as entrepreneurial behaviors (Becherer & Maurer, 1999), sales performance (Crant, 1995), individual innovation (Seibert, Kraimer, & Crant, 2001), and small-firm innovation (Kickul & Gundry, 2002). Moreover, some scholars also investigate the relationships among the individual and work environment determinants with proactive behavior at workplace. For instance, using data collection from United Kingdom wire makers, Parker, Williams, & Turner (2006) identify direct antecedents such as job autonomy, flexible role

orientation and role breadth self-efficacy, which have a positively significant impact on proactive behavior. By analyzing a data collection of 491 supervisors from 32 Australian state organizations, Griffin, Neal, & Parker (2007) show that open to change has a positive relationship with proactivity in all terms of organization member, team member, and individual task. Moreover, to explore other potential antecedents, in a recent study, Bao et al. (2019) illustrate that openness toward change has a positive impact on proactive behavior.

Prior studies on proactivity have proposed that the settlement to pledge in proactive behaviors needs information sharing. For instance, managers should motivate employees to express proactive behavior at workplace. In other words, organizations that concentrate on increasing employee proactivity need to invest in many kinds of supportive mechanisms in terms of competence development and information sharing. The more transparent information, the better employees can focus on improving their performance instead of being disappointed by feeling of unrecognized their contributions (Maden, 2015). Moreover, quality of information given to employees enables them to understand potential problems and recognize opportunities. Therefore, managers need to provide reliable information to help employees to forecast and understand what affect their working climate in advance (Escrig-Tena, Segarra-Ciprés, García-Juan, & Beltrán-Martín, 2018; Grant & Ashford, 2008). Based on the prior results, the following hypotheses were proposed:
H4: Top management support has a positive relationship with openness toward change.
H5: Openness toward change has a positive relationship with proactive behavior.
H6: Top management support has a positive relationship with proactive behavior.

2.5. Perceived environmental responsibility

Perceived environmental responsibility reflects individual's behavior to environment protection. For instance, Lee (2009) investigates gender difference in perceived environment responsibility through data survey of 48 high schools in Hong Kong. The findings show that both female and male concern perceived environmental responsibility when buying green products. With this perception, consumers would consider high-carbon consumption as irresponsible and selfish actions. In other words, they would have a sense of responsibility and engage in pro-environmental behaviors (Rice, 2006; Wang, Wei, and Zhang, 2019). In addition, they could also search for improving their standing by implementing environmentally friendly practices (Lee, 2009). In this study, we explore how managers' responses to environmental responsibility at workplace. We suppose that managers play an essential role in leading to environmental awareness. Moreover, according to the face negotiation theory, as perceiving an environmental responsibility, managers who are concerned with preservation of their face consciousness would intend to pursue energy saving measures since they can attain face and status power by participating into environmental protection to create a positive image at work (Wang et al., 2019).

Furthermore, according to the theory of planned behavior (TPB), behavioral intention is influenced by three factors (subjective norms, perceived behavioral control, and attitude towards behavior). Other previous studies have expanded the TPB by appending descriptive norms to reflect the new social influence, and proposed enlarged explanatory power of behavioral intention (Cristea, Paran, and Delhomme, 2013; Forward, 2009; Li et al., 2019). Specifically, descriptive norms have played an important role in considering solar with a low perceived behavioral control (Rai & Beck, 2015). In general, the TPB is proved as an appropriate framework to estimate energy-saving behaviors (Kaiser & Gutscher, 2003; Li et al., 2019; Rai & Beck, 2015; Scherbaum et al., 2008). This paper extended the TPB by considering perceived environmental responsibility as predicting energy-saving intention at workplaces. Moreover, it is worth noting that perceived behavioral control is an essential determinant of behavioral intention in several studies (Botetzagias, Dima, & Malesios, 2015; Hua & Wang, 2019; Lizin, Van Dael, & Van Passel, 2017; Ru, Wang, & Yan, 2018). Some external situations, including time, cost, resources, managerial skills and knowledge, are possibly free from individual control, and hence influence personal intention

to join in a particular practice (Ru et al., 2018). In this paper, we suppose that proactive behavior is considered as one specific type of perceived behavioral control. If managers feel responsibilities for their tasks and have management skills and relevant knowledge to save energy at workplace, they attempt to seek for appropriate ways to conserve energy. It implies that perceived environmental responsibility could influence both energy saving intention and proactive behavior. Thus, the following hypotheses were proposed:

H7: Perceived environmental responsibility is positively associated with energy saving intention
H8: Perceived environmental responsibility is positively associated with proactive behavior
H9: Proactive behavior is positively associated with on energy saving intention

Albeit the previous studies shed light on the energy saving behavior, the research endeavor in this field is still at an initial stage. Most of the present literature has concentrated on either household energy savings or office workers. Middle managers in SMEs comprise a crucial goal group for determining energy saving, but little research attempt has been expanded to investigate what motivates middle managers to save energy at workplaces. To fulfill this gap in the literature, we integrate both theories (TPB and social information processing) to build a research model for examining the role of social pressure, top management support, internal psychological behaviors (proactive behavior) and perceived environmental responsibility in energy saving intention in SMEs. Figure 2 presents the integrated research model.

Figure 2. The research model

3. Research design

3.1. Measurements

All measured items were adapted from previous literature with some adjustments to conform the research context in Vietnam. The questionnaire was initially developed in English version. We followed three procedures to complete the questionnaire. First, the questionnaire was translated into Vietnamese by researchers whose mother language is Vietnamese. Second, we conducted a focus group with two professors and three managers to help us to check the Vietnamese questions. Hereafter, they suggested some adjustments to ensure respondent understand the questions. Third, a pilot test with 20 managers was implemented to satisfy no errors and appropriate contends. We designed a five-point Likert scale ranging from "strongly disagree" to "strongly agree" for all items.

The latent variable of social pressure is adapted from (Tang et al., 2019; Wang et al., 2014) with four items. Two sample items include "my colleagues expect me to save energy" and "I feel pressured due to the energy-saving activities of my colleague". The construct of energy-saving intention is developed from (Gao et al., 2017; Park and Kwon, 2017; Tang et al., 2019) with four items. A sample item includes "I am willing to save energy for my company". Perceived environmental responsibility including five items is adapted from (Lee, 2009; L. Wang et al., 2019). A sample modified item consists of "I strongly agree that more environmental protection works are needed at workplaces". Top management support consisting of four items is adapted from (Wang et al., 2018). The latent variable of openness toward change is developed by (Bao et al., 2019; Miller et al., 1994). Proactive behavior is a second order factor including three sub-factors such as organization member, team member, and individual task (Griffin et al., 2007). This factor is adapted from (Bao et al., 2019; Griffin et al., 2007). The measured items with denotes and their sources are presented in Appendix A, Table A1.

3.2. Data collection

A questionnaire survey approach was used to collect data. All respondents are middle managers from SMEs. It took five months to complete the data collection from June to November 2019. After modifying the questionnaire for appropriate research context in Vietnam, the questionnaire was deliverd to 400 middle managers of SMEs. It worth noting that the Center for Customer Service of Vietnam Electricity in HCMC assisted to select potential respondents. Particularly, it first introduced the authors to contact with 40 middle managers to conduct the survey. And then, like a snowballing approach, these managers continued to introduce us to contact other managers. In addition, the authors also received valuable supports for conducting the survey from MBA students, who are placed in the position of managers in enterprises. Finally, after checking all returned questionnaires, responses with missing information were removed. As a result, 336 responses were used for data analysis.

4. Results

4.1. Demographic characteristics

Demographic characteristics consisted of gender, age, education, managing field, and exprerience in the management position. Most respondents are male and account for 80.95% of the total respondents. 47.02% of the respondents were between 41 and 49. For the educational level, most of the respondents held a bachelor's degree or higher. 44.05% of the respondents had management experience in production factory. Finally, 50.60% of the respondents had more than 15 years in the management position. Table 1 presented the demographic profile of the respondents.

Table 1. The respondents' demographics

Characteristics	Items	Count (N=336)	Percent
Gender	Male	272	80.95
	Female	64	19.05
Age	25-30	58	17.26
	31-40	71	21.13
	41-49	158	47.02
	> 50	49	14.58
Education	Bachelor Degree	260	77.38
	Master Degree	72	21.43
	PhD. Degree	4	1.19
Manager in	Finance/Accounting	64	19.05
	Production factory	148	44.05
	Marketing	29	8.63
	Plan and development	47	13.99
	Material supply	28	8.33
	Customer services	16	4.76
	Others	4	1.19
Experience in the management position	< 3 year	18	5.36
	3 – 5 years	22	6.55
	5 – 10 years	37	11.01
	10 – 15 years	89	26.49
	> 15 years	170	50.6

4.2. Analysis and results

PLS-SEM approach was employed to test the hypotheses with support SmartPLS 3.0. It is a suitable approach for examining a complicated model with many contemporary relationships (Tran & Nguyen, 2020). Before analyzing the data and testing the research hypotheses, we need to observe the descriptive statistics for our variables (Nyangarika, Mikhaylov, & Richter, 2019). Table 2 reports descriptive statistics of all measured items. The rule of thumb demonstrates that each outer loading should be larger or equal to the threshold of 0.7 (Hair, Sarstedt, Hopkins, & Kuppelwieser, 2014). To satisfy the threshold, the following items (PB9, PER5, OTC4 and OTC5) were eliminated due to low loadings. Table 2 reports the remaining outer loadings as being larger than 0.7, which satisfy the reliability of the scale. Cronbach's alpha and composite reliability (CR) values are greater 0.8 and in the good range (Hair et al., 2014). Table 2 also shows that average variance extracted (AVE) values are greater than 0.5, which meet the requirement for assessing convergent validity.

Table 2. Reliability and convergent validity

Variables	Mean	SD	Factor Loading	Alpha	Rho_A	CR	AVE
Thresholds				≥ 0.6	≥ 0.7	≥ 0.7	≥ 0.5
Environmental saving intention (ESI)				0.894	0.900	0.927	0.761
ESI1	4.050	0.839	0.890				
ESI2	4.155	0.741	0.923

Discriminant validity is confirmed when the square root of the AVE values should exceed the correlation between two particular constructs (Fornell & Larcker, 1981). The findings on Table 3 satisfy this recommendation. In addition, Table 4 presents Heterotrait-Monotrait ratios, which are below 0.85 (Clark & Watson, 1995). Hence, the two different assessments affirm the scale of the model to assure the discriminant validity (Tran & Nguyen, 2020).

Table 3. Discriminant validity (Formell and Lacker)

	Formell and Lacker's Criterion					
	ESI	**OTC**	**PB**	**PER**	**SP**	**TMS**
Environmental saving intention (ESI)	*0.872*					
Openness toward change (OTC)	0.354	*0.893*				
Proactive behavior (PB)	0.397	0.379	*0.782*			
Perceived environmental responsibility (PER)	0.299	0.227	0.615	*0.864*		
Social pressure (SP)	0.600	0.456	0.378	0.296	*0.870*	
Top management support (TMS)	0.456	0.613	0.396	0.212	0.480	*0.882*

Notes: the square root of AVE on the diagonal.

Table 4. Discriminant validity (Heterotrait–Monotrait ratios of correlations).

	ESI	**OTC**	**PB**	**PER**	**SP**	**TMS**
Environmental saving intention (ESI)	*Criteria ≤ 0.85*					
Openness toward change (OTC)	0.404					
Proactive behavior (PB)	0.443	0.425				
Perceived environmental responsibility (PER)	0.338	0.258	0.681			
Social pressure (SP)	0.667	0.516	0.415	0.326		
Top management support (TMS)	0.505	0.689	0.435	0.235	0.532	

4.3. Structural model assessment

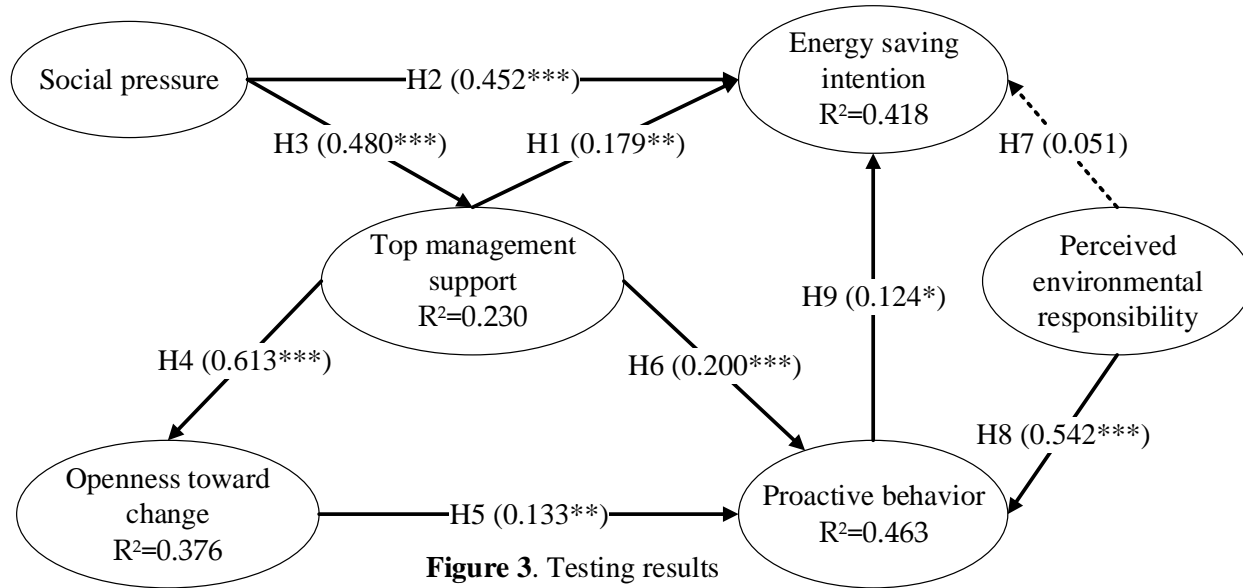
Analytical results of the PLS-SEM are implemented step by step according to the guidelines of (Hair, Hult, Ringle, and Sarstedt, 2016). The R-square values of two constructs (openness toward change and top management support) are 0.376 and 0.230, respectively. Those of proactive behavior and energy saving intention are 0.463 and 0.418, respectively. Moreover, the f-square indicators are larger than zero. Hence, these testing results satisfy the requirement for the model's predictive power in terms of forecasting outside the sample (Hair et al., 2016; Hair, Ringle, and Sarstedt, 2012). Figure 3 presents the path estimated coefficients in brackets.


Figure 3. Testing results
(*p<0.1, **p<0.05, ***p<0.001)

Table 5 reports the path estimated coefficients and respective p-values, and significant level. All the hypotheses are supported with a statistical significance, except for H7. The testing results indicated that top management support had the strongest influence on openness toward change ($\beta = 0.613$, p<0.001), thus supporting H4. The paths from social pressure to energy saving intention ($\beta = 0.452$, p<0.001), and top management support ($\beta = 0.480$, p<0.001) were positive and significant, hence confirming H2 and H3. Top management support was positively related to both energy saving intention ($\beta = 0.179$, p<0.05) and proactive behavior ($\beta = 0.200$, p<0.001), thus supporting H1 and H6. Openness toward change was positive related to proactive behavior ($\beta = 0.133$, p<0.05), thus confirming H5. Proactive behavior has a positive impact on energy saving intention ($\beta = 0.124$, p<0.1), thus supporting H9. Finally, perceived environmental responsibility was positively related to proactive behavior ($\beta = 0.542$, p<0.001), but not energy saving intention ($\beta = 0.051$, p=0.340), thus confirming H8, but not H7.

Table 5. Estimated results

Hypothesis		Beta	P-value		Result
H1.	TMS → ESI	0.179	0.002	**	Supported
H2.	SP → ESI	0.452	0.000	***	Supported
H3.	SP → TMS	0.480	0.000	***	Supported
H4.	TMS → OTC	0.613	0.000	***	Supported
H5.	OTC → PB	0.133	0.033	**	Supported
H6.	TMS → PB	0.200	0.001	***	Supported
H7.	PER → ESI	0.051	0.340	n.s.	Not Supported
H8.	PER → PB	0.542	0.000	***	Supported
H9.	TMS->ESB	0.124	0.060	*	Supported

Notes: *p<0.05; **p<0.01; ***p<0.001; n.s. = non-significance.

5. Discussions and implications

We developed and validated the research model based on the integration of two referenced theories including the social information processing theory, and TPB. The respondents are managers of SMEs in Vietnam. With eight out of the nine suggested hypotheses supported, the findings disclose the following results. The research model, integrated and extended in two theories, can explain an essential circumstance of the reasons why managers intend to save energy at workplaces. First, TPB was extended to explain and predict manager's energy conservation intention and social pressure (extended from subjective norm). The developed hypothesis to capture the impact of social pressure on energy saving intention is supported. This result is in line with prior studies that social pressure, considered as an essential determinant, has a significant influence on energy saving intention of residents (Liu et al., 2020; Wang et al., 2018; Yue et al., 2013); and employees (Scherbaum et al., 2008; Tang et al., 2019). The TPB was also extended by considering perceived environmental responsibility as the predictors of energy-saving intention at workplace. The findings showed that perceived environmental responsibility had no direct effect on energy saving intention; but it had an indirect impact on energy saving intention through proactive behavior. The results were not line with previous studies (Botetzagias et al., 2015; Hua & Wang, 2019; Lizin et al., 2017; Ru et al., 2018).

Second, the social information processing theory was used to examine the relationship between proactive behavior with both openness toward change and top management support. The findings revealed how managers dealt with the challenges from internal factor such as top management support and exogeneous organizational factor such as openness toward change. However, how managers utilize such substantial factors for saving energy at workplaces remains unknown. The findings showed that manager's proactive behavior was positively associated with energy saving intention. Moreover, top management support had a significantly direct effect and indirect effect on proactive behavior through openness toward change. In turn, openness toward change was positively associated with proactive behavior. This result is in line with the previous finding (Bao et al., 2019). These finding extend our understanding of how managers respond to energy saving intention.

Finally, in the extension of previous behavior literature, we found that top management support played a central role in connecting key factors such as social pressure, openness toward change, proactive behavior, and energy saving intention in the integrated research model. Particularly, the support from top managers not only stimulates middle managers to pursue energy saving actions, but also encourage their ability to transfer positive attitude and openness toward change into proactive behavior. The findings are partially consistent with previous studies on top managers' role in accompanying middle managers' attitude toward environmental responsibility (Bao et al., 2019; Chin, Rowley, Redding, & Wang, 2018).

5.1. Theoretical implications

This paper offers some crucial theoretical implications. First, research on managers' energy saving intention in SMEs retains relatively new and has not been concerned in the prior studies. Previous studies on energy saving phenomenon have concentrated mainly on rational factors (e.g. attitude) of consumers (Gadenne et al., 2011; Hua & Wang, 2019); residents (Liu et al., 2020; Wang et al., 2018; Yue et al., 2013); employees (Scherbaum et al., 2008; Tang et al., 2019; Zhang et al., 2014). Most of these mentioned studies applied TPB theory to develop the research hypotheses. In addition, in the recent research, Bao et al. (2019) applied the social information processing theory to build the research model to evaluate middle managers' proactive behavior in responding environmental regulation, but not energy saving intention. Ours is among the first studies to integrate and extend both theories of TPB and social information processing to examine managers' responses to energy saving intention at workplaces.

5.2. Policy implications

The results provided some valuable recommendations for practitioners. First, the findings confirm that top management support play a fundamental role in SMEs' saving energy. Accordingly, company leaders should create incentive policies to motivate middle managers to implement energy saving behavior at workplaces. In addition, company leaders should attempt to generate a working environment where everyone is willing to change and has the autonomy to implement proactive behaviors. In other words, managers can share and receive innovative ideas or suggestions to improve the production process with energy efficiency. Second, our results of indirect impact of perceived environmental responsibility on energy saving through proactive behavior also indicate that perceived responsibility stimulates managers to be more proactive in energy-saving actions and evaluates whether their enterprises are ready for pursuing sustainable development. Therefore, company leaders should encourage to widespread propaganda of energy-saving behavior throughout training programs to enhance workers to use energy efficiency. Furthermore, top and middle managers should be more proactive in creating the sustainable business strategy.

6. Conclusions

This study shed a new light on managers' energy-saving intention in SMEs. The results enable us to add some theoretical and managerial contributions. We integrated and extended both theories of TPB and the social information processing into developing the research model. The empirical findings confirmed the key role of top management support in stimulating energy saving consumption at workplaces. Under the social pressure, managers are willing to change and stimulate subordinates to reduce energy consumption. They should enhance awareness of environmental responsibility at workplaces to gain the sustainable business development. The more openness toward change, managers are more proactive to seek for innovative ideas and suggestions to use energy efficiency at workplaces. To sum up, this study provides a better understanding of SMEs' energy-saving intention.

Limitations

Notwithstanding the current study reveals several implications, there are remarkable limitations, which should be investigated in future studies. First, SMEs participated are mainly located in HCMC, Vietnam. Therefore, caution must be taken when generating findings to other regions in Vietnam, other countries and larger corporations due to different cultural and social atmospheres. Second, it is better to extend the research model with external effects such as incentive policies for company investment in new technologies to protect environment. Considering in the external effects, future research can explore different interactions among determinants in the energy saving phenomenon.

Appendix A.

Table A1. Measure scale

Variables		Code	Items	Adapted and modified from previous studies
Social pressure		SP1	Most people who are important to me think I should save energy.	(Tang et al., 2019; Zhang et al., 2014)
		SP2	My director expects me to save energy.	
		SP3	My colleagues expect me to save energy.	
		SP4	I feel pressured due to the energy-saving activities of my colleagues	
Proactive behavior	Individual task proactivity	PB1	Initiated better ways of doing my core tasks	(Bao et al., 2019; Griffin et al., 2007)
		PB2	Come up with ideas to improve the way in which my core tasks are done	
		PB3	Made changes to the way your core tasks are done	
	Team member proactivity	PB4	Suggested ways to make my work unit more effective	
		PB5	Developed new and improved methods to help my work unit perform better	
		PB6	Improved the way my work unit does things	
	Organization member proactivity	PB7	Made suggestions to improve the overall effectiveness of the organization (e.g., by suggesting changes to administrative procedures)	
		PB8	Involved myself in changes that are helping to improve the overall effectiveness of the organization	
		PB9	Come up with ways of increasing efficiency within the organization	
Top management support		TMS1	Top management team in my organization is committing to implement environmental protection	(S. Wang et al., 2018)
		TMS2	The implementation of environmental protection can receive full support from my top management team	
		TMS3	Top management team can provide adequate resources to support the implementation of environmental protection	
		TMS4	Top management team consistently assesses the business impact on the environment by implementing environmental protection	
Perceived environmental responsibility		PER1	It is essential to promote environmental responsibility at workplaces	(Lee, 2009; L. Wang et al., 2019)
		PER2	I strongly agree that more environmental protection works are needed	
		PER3	I concern for environmental protection issues	
		PER4	I think environmental protection is meaningful	
		PER5	It is very important to raise environmental awareness at workplaces	
Openness toward change		OTC1	I would consider myself to be "open" to the changes the work teams will bring to my work role	(Bao et al., 2019; Miller et al., 1994)
		OTC2	Right now, I am somewhat easy to the proposed changes in work teams	

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

	OTC3	I am looking forward to the changes in my work role brought about by the implementation of work teams	
	OTC4	I think that the implementation of work teams will have a positive effect on how I accomplish my work.	
	OTC5	From my perspective, the proposed changes in the work teams will be for the better.	
Energy saving intention	ESI1	I am willing to save energy for my organization	(Gao et al., 2017; Park and Kwon, 2017; Tang et al., 2019)
	ESI2	I intend to engage in energy-saving activities in my organization	
	ESI3	I will make an effort to save energy in my organization	
	ESI4	I recommend others use energy-saving in my organization

Phuong V. NGUYEN is currently an Associate Professor of Business Management at International University, Vietnam National University, Ho Chi Minh City. Before becoming a Lecturer, he had 11 years of working experience in Telecom Industry in Vietnam. He has participated in several consulting projects as the role of a financial manager, project leader, and strategic business advisor. Since working in the academic field, his research interests include the technology spillovers, international strategies, and innovation from foreign direction investment and behavioural studies on business management and public administration.
ORCID ID: orcid.org/0000-0002-2034-4471

Khoa T. TRAN is the Rector of International University, Vietnam National University, Ho Chi Minh City. He received his MBA in International Business at Asia Institution of Technology in Thailand in 1996. He completed his doctorate degree in Marketing and International Business at Western Sydney University, Australia in 2014. His research interests include educational management, brand development, international marketing, technology transfers and behavioural studies on business management and public management.

Abstract. Job satisfaction has a pivotal role in improving employee performance. It provides enthusiasm and high motivation to employees to increase productivity. On the other hand, to improve employee performance, the organization provides compensation based on established standards and in an environment that is, sometimes, less conducive. This study purposes to examine the mediating role of job satisfaction on compensation, work environment, and employee performance at State Polytechnic colleges in Indonesia. This study used Partial Least Square (PLS) as data analysis. This study found that compensation has no impact on job satisfaction and employee performance. In addition, job satisfaction cannot mediate the compensation and employee performance. However, the work environment positively and significantly affects job satisfaction and employee performance. Job satisfaction has impact on work environment and employee performance. It also influences employee performance positively and significantly. Thus, job satisfaction directly or indirectly can be a mediator for the relationship between work environment and employee performance.

Keywords: Job Satisfaction, compensation, work environment, employee performance, and State Polytechnic colleges.

1. Introduction

Globalization has brought many challenges to organizations in managing employee performance to achieve organizational goals (Gorondutse & Hilman, 2019; Polychroniou & Trivellas, 2018). The success of an organization hang on the utilization of human resources such as people who provide energy, creativity, and enthusiasm for the organization and plays a pivotal role in the implementation of organizational operations (Ali Alsheikh, Ahmad Alremawi, & Bin A Tambi, 2018). Human resources must always be considered, maintained, and developed by organizations (Dessler, 2000; Hasibuan, 2002; Purwadita, Sudiro, Mugiono, & Idris, 2018; A.

Sani, Wekke, Ekowati, Abbas, & Idris, 2018; Achmad Sani, Ekowati, Wekke, & Idris, 2018). The performance of private employees is considered better than civil servants. Private employee performance standards tend to be more transparent and more measurable. By providing reward and punishment, recruitment, promotion, and mutation, private organizations are more open than civil servants. As a result, their performance and organizational performance at the same time are further improved. Furthermore, globalization has also pushed bureaucratic reform into a necessity and the high performance of Civil Servants has become a demand for public organizations, as a consequence of increasing their salaries.

In 2016, the Ministry of State Apparatus and Bureaucratic Reform of Indonesia released a survey on the Performance of Civil Servants. The survey found that only 40% of civil servants in Indonesia have certain skills and expertise at work. In addition, as many as 60% of the total 4,498,643 civil servants in Indonesia have only administrative expertise. Based on these findings, it was revealed that many civil servants were monotonous in their work and lack of innovation in carrying out their work. Therefore, improvements in employee recruitment in the future must be based on the skills and capabilities of candidates to occupy the required formation (Abnur, 2016). This of course also occurs in state polytechnics college as one of the government institutions in the field of education. Therefore, improving employee performance in this context is vital to be a concern.

Higher education is one of the service organizations that is dependent on Human Resources to achieve its goals. Its success depends greatly on the activities of the utilization of Human Resources. Employees who provide energy, creativity, and enthusiasm for the organization for the continuity of the operational functions of the organization need to manage Human Resources to improve employee performance as expected. However, organizational management often has difficulty in identifying the factors caused the decline in employee performance (Idris, 2019).

No organization can achieve its goals successfully through the hard work of one or a few individuals. In short, all employees must perform well to achieve the goals of the state polytechnic college. In fact, employee performance has many dimensions that must be considered by the institution because it affects the strategy and goals of the organization (Idris & Adi, 2019). Therefore, the overall performance of employees makes a significant contribution to the core of the organization. Productivity and efficiency are benchmarks of employee performance. This raises an understanding of the importance of the role of employees as organizational assets, the organization cannot achieve its goals without the participation of employees (Idris et al., 2020).

The concept of employee performance refers to the level and quality of effort, cooperation, commitment, tardiness and absence, as well as employee adherence to organizational standards. Similarly, employees who work to achieve certain jobs that lead to positive results and behavior. Employee performance is the achievement and contribution of individual workers that can be measured. It is a concept with complex aspects and is susceptible to the influence of several variables, which include age, gender, employee recognition and job satisfaction (Hambali & Idris, 2020; Supriyanto, Ekowati, Idris, & Iswanto, 2020).

For the sake of survival, employee in the state polytechnics college work to get money to meet all their needs. Thus, employees work hard and show loyalty to the organization. Compensation provided by the organization is an appreciation of employee work performance. It is a way for management in improving work performance, motivating and improving the performance of employees (Mathis & Jackson, 2000). Compensation has a significant impact on employee performance (Anderson, Pyo, & Zhu, 2018; Buachoom, 2017; Salisu, Chinyio, & Suresh, 2015). Mabaso and Dlamini (2017) found that compensation is a key factor that can affect employee satisfaction. However, in this study, benefits, as part of the compensation dimension, did not affect job

satisfaction. Industrial employees in Ethiopia are satisfied with the compensation payments they receive, which increases the performance of employees (Addis, Dvivedi, & Beshah, 2018). In addition, not only compensation satisfaction can have a broad impact on work behavior and quality of life of employees, but also financial benefits can be a critical factor for performance (Che Ahmat, Arendt, & Russell, 2019; Igalens & Roussel, 1999; Patiar & Wang, 2020; Syed, 2020).

CEOs of technology and non-technology companies in the USA, for example, suppressed compensation payments when the industrial cycle was declining, which was intended to motivate employees to improve their performance (Anderson et al., 2018). The dependency of the unit wage compensation scheme in Australia results in higher employee performance compared to the fixed payment bonus compensation scheme (Chong & Leung, 2018). In another study, some regulations have been issued by the Chinese government to control executive compensation of state-owned businesses, by setting the optimum level of managerial compensation with orientation to the average wage of employees. This is significant by increasing employee satisfaction which has an impact on employee performance in China (Jiang & Zhang, 2018). In addition, The importance of the Islamic work ethic applied in organizations provides intrinsic motivation and employee work attitudes such as organizational commitment and job satisfaction, thereby it can increase employee performance in the organization (Kataria, Garg, & Rastogi, 2019).

Compensation practices, workforce planning, and HR practices that focus on work or life balance can be used to estimate job satisfaction and can increase reductions in turnover intentions (Martinson & De Leon, 2018). In contrast, a study in Kenya showed teachers felt very unhappy with all aspects of the compensation received financially or non-financially. However, the basic salary, benefits and work environment greatly affect teacher job satisfaction (Muguongo, Muguna, & Muriiti, 2015). Also, sale satisfaction has no a positive impact on employee performance in insurance companies (El Samen & Akroush, 2018). Thus, this study is intended to fill the gap of findings in the previous research.

Organizations face several tasks due to the dynamic landscape of the environment. To deal with the environment and changes that are constantly changing and developing to be success and remain competitive, the organization needs to satisfy its employees by meeting the needs of employees and providing good working conditions (Amabile, Conti, Coon, Lazenby, & Herron, 1996; Amiroso & Mulyanto, 2015). Empirical studies have illustrated that the environment plays a pivotal role in improving performance. Educational institutions, banking and the telecommunications industry in Pakistan prove that work environment and job satisfaction correlated positively. Managers recognize the standing of a good work environment to optimize the high of job satisfaction (Raziq & Maulabakhsh, 2015). Jain and Kaur (2014), and Muguongo, et al. (2015) found a significant relationship between work environment and satisfaction. However, work environment that is not conducive in banking industry in India proves a negative impact on employee satisfaction (Dhamija, Gupta, & Bag, 2019). Also, Amiroso and Mulyanto (2015) found that the work environment did not affect the employee performance. The difference in these findings provides further opportunities in further research to confirm the gap. Therefore, this study is intended to examine the link of compensation, work environment, job satisfaction, and employee performance.

2. Literature review

2.1 Compensation, job satisfaction, and employee performance

Compensation is everything that employees receive as compensation for their work (Handoko, 2006). Compensation is also considered as any form of compensation given by the company to its employees for the sacrifice of the employee concerned (Soehardi, 2003). The sacrifice of these employees can be in the form of work, performance services, costs, or the effort spent to achieve certain goals set by the company. Meanwhile, Simamora (2006) argues that compensation is also all forms of financial returns, tangible services, and benefits received by employees as a portion of an employment relationship.

In awarding compensation, what should be noted is that compensation must be appropriate, fair, acceptable, satisfying, motivating for work, rewarding, and based on needs. Giving compensation will provide benefits to both parties, both to the company and to the employees (Sopiah, 2013). This is due to job satisfaction can affect happiness, morale, and employee motivation in increasing productivity (Mabaso & Dlamini, 2017; Zhang, Cai, Jia, & Li, 2018)

Empirical evidence that proves the relationship of compensation, satisfaction, and performance is proven by several previous studies. Compensation positively affect employee performance (Anderson et al., 2018; Buachoom, 2017; Salisu et al., 2015). Industrial employees in Ethiopia are satisfied with the compensation payments they receive so as to improve the employees performance (Addis et al., 2018). An increase in compensation give a positive impact on employee satisfaction which has an effect on increasing employee performance (Chong & Leung, 2018; Jiang & Zhang, 2018; Martinson & De Leon, 2018). The essential of the Islamic work ethic applied in organizations provides intrinsic motivation and employee work attitudes such as organizational commitment and satisfaction, thereby it can increase employee performance in the organization (Kataria et al., 2019). Based on the description, the hypothesis is proposed as follows.
Hypothesis 1: There is a significant effect between Compensation and Employee Performance.
Hypothesis 2: There is a significant effect between Compensation and Job Satisfaction.
Hypothesis 3: There is a significant effect between Compensation and Employee Performance through Job Satisfaction.

2.2 Work environment, job satisfaction, and employee performance

Work environment is somewhat that is in the workers setting and that impact their finishing tasks assigned (Nitisemito, 2001). The work environment is the entire tool kit, the close environment in which methods, works, and arrangements of a person both as individuals or as a group (Sedarmayanti, 2011). The work environment is also defined by noise, tools, materials, space, physical layout, and co-worker relationships as well as the quality of all of those that have essential impacts on the high quality of work (Raziq & Maulabakhsh, 2015).

Safe, comfortable and attractive working conditions are created if the environment around the workplace is healthy (Raziq & Maulabakhsh, 2015). Healthy work environment includes regulation of noise, workplace lighting, humidity and air temperature, service needs of employees, use of color, maintenance of environmental cleanliness and the provision of various facilities needed by employees, such as toilets, changing rooms, and places of worship (Amiroso & Mulyanto, 2015).

Some empirical evidence conducted by previous researchers proves that the effect of work environment, job satisfaction, and employee performance was significant. Educational institutions, banking and the telecommunications industry in Pakistan prove a significant effect of the work environment to employee job

satisfaction. Managers recognize the standing of a respectable work environment to exploit the level of job satisfaction (Raziq & Maulabakhsh, 2015). Jain and Kaur (2014), and Muguongo, et al. (2015) found a significant correlation between work environment and job satisfaction. The banking industry in India proves that the work environment make employee unhappy resulting in decreased employee performance (Dhamija et al., 2019).
Hypothesis 4: There is a significant effect between work environment and employee performance.
Hypothesis 5: There is a significant effect between work environment and job satisfaction.
Hypothesis 6: There is a significant effect between work environment and employee performance through job satisfaction.

2.3 Job satisfaction and employee performance

Job satisfaction is a significant aspect in the practice of organizational behavior and human resource management. Job satisfaction could affect happiness, morale, and employee motivation in increasing productivity (Mabaso & Dlamini, 2017). Job satisfaction is a close personal entity that can be felt by those concerned. Owusu (2014) states that job satisfaction is a feeling of preference or satisfaction with one's work or experience at work. This condition can lead employees to a condition where they can improve their performance level. Meanwhile, in different conditions, emotionally dissatisfied with work, can cause low performance of employees. On the other hand, high performance is very important for organizations to achieve what has been the goal.

Bernandin and Russel (1993) defines performance as a record of the results from the function of a particular job during a certain period. Meanwhile, according to Mangkunegara (2009) performance is the product of quality and quantity of work accomplished by an employee in finishing their tasks and related to their responsibilities to fulfil their duties on time. Performance is defined as the product reached by a person in finishing the tasks assigned based on their experience, skill, and sincerity. Performance is also a combination of three essential factors including the interest and ability of a worker, the ability and acceptance of the delegation's task explanation, and the role and level of worker motivation. The higher the three factors, the greater the person's performance (Hasibuan, 2002).

Previous research has shown a positive effect in job satisfaction and employee performance (Amiroso & Mulyanto, 2015; Chong & Leung, 2018; Dhamija et al., 2019; Jiang & Zhang, 2018; Kataria et al., 2019; Martinson & De Leon, 2018). To improve overall performance, managers target and focus on the welfare of their employees so as to encourage employees to work better. This is an effort to satisfy the workers (Shahzad, Farrukh, Kanwal, & Sakib, 2018). Thus, the hypothesis is proposed as follows.
Hypothesis 7: There is a significant effect between job satisfaction and employee performance.

Based on theoretical and empirical understanding, the conceptual framework is as follows (Figure 1).

Fig. 1. Conceptual Model

3. Research method

This research used an explanatory approach. The population of this study is fulltime and permanent employee at State Polytechnic colleges in East Java, Indonesia (Three Colleges). The questionnaire was distributed to 155 civil servants who had worked for more than one year. The data have been collected between April to July 2019 . The sample was determined by slovin formula as follow:

$$n = \frac{N}{1 + Ne^2}$$

$$n = \frac{253}{1 + 253 \times 0.05e^2}$$

$$n = \frac{253}{1 + 253 \times 0.0025}$$

$$n = \frac{253}{1 + 0.6325}$$

$$n = \frac{253}{1.6325}$$

$$n = 154.977$$

The demographic profile for respondents indicated by table 1 as follow.

Table 1. Demographic Profile for respondents ($n =155$)

Variables	Categories	%
Gender	Male	37
	Female	63
Age	<25	3
	26-30	52
	>30	45
Highest Education	Senior high school	10
	Bachelor	88
	Master	2
Working status	<3	18
	3-5	78
	>5	6

Source: Data processed (2019)

3.1 Measures

The definition of a variable and the process of determining the indicators or dimensions of each variable is an attempt to form indicators of a variable that has been described previously. Establishment of variable indicators to assist measurement techniques and facilitate observation in data collection. The following are the variables and their indicators (Table 2).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Table 2. Operational Variables

Variables	Indicators	Scales	Sources
Compensation (X1)	Salary		Odunlade (2012)
	Incentive		
	Allowance		
	Facilities		
Work environment (X2)	Physical		Jain and Kaur (2014)
	Non-Physical	5 Likert Scale	
Job Satisfaction (Z)	Work itself		Mabaso and Dlamini (2017)
	Cooperation		
	Promotion		
	Supervision		
Employee Performance (Y)	Work quantity		Jamil and Raja (2011)
	Work quality		

Source: Data processed (2019)

The questionnaire was developed and adapted from previous studies, compensation from Odunlade (2012), work environment from Jain and Kaur (2014), job satisfaction from Mmabaso and Dlamini (2017), and employee performance from Jamil and Raja (2011). This study used likert-type scale to measure each item for all variables ranging from 1 = strongly disagree to 5 = strongly agree. One sample item included "I am satisfied with the salary".

Partial least square (PLS) was used to analyzed the data--structural modeling with indicators that are reflective and formative (Ghozali, 2006). Measurement of each variable used indicators adopted from several theories that have been used by previous researchers as described in table 2.

4. Results and discussions

4.1 Measurement model
The first stage in PLS analysis is assessing the construct validity and reliability. It was measured by loading Factor value and Average variance extracted (AVE). An instrument meet the convergent validity by loading factor exceeding 0.6 (Ghozali, 2006) and AVE above 0.5 (Chin, 1995). The results are presented as follow (Table 3).

Table 3. The Convergent validity measured by loading factors

Variables	Indicators	Loading Factor	Cut off	Inf.
Compensation (X1)	X.1.1	0.742	0.6	Valid
	X.1.2	0.791	0.6	Valid
	X.1.3	0.818	0.6	Valid
	X.1.4	0.730	0.6	Valid
Work Environment (X2)	X.2.1	0.898	0.6	Valid
	X.2.2	0.907	0.6	Valid
Job Satisfaction (Z)	Z.1	0.809	0.6	Valid
	Z.2	0.806	0.6	Valid

	Z.3	0.807	0.6	Valid
	Z.4	0.810	0.6	Valid
Employee Performance (Y)	Y.1	0.692	0.6	Valid
	Y.2	0.910	0.6	Valid

Source: Data processed (2019)

Table 3 shows the loading factors exceed 0.6 ranging from 0.692 to 0.910, which indicate adequate validity from all variables. The loading factors values exceed the minimum criteria, which mean that all variables are valid. It can be assumed that the model could describe the relationship of all indicators with their latent variables. Compensation, work environment, job satisfaction, and employee performance are valid as it has fulfilled the criteria for measuring convergent validity > 0.6. Therefore, these indicators can measure the variables (Table 4).

Table 4. Average Variance Extracted (AVE)

Variables	AVE	Cut off	Keterangan
Compensation (X1)	0.514	0.5	Valid
Work environment (X2)	0.697	0.5	Valid
Job satisfaction (Z)	0.581	0.5	Valid
Employee performance (Y)	0.589	0.5	Valid

Source: Data processed (2019)

Table 4 indicates that all indicators are valid because the measurement results of the model meet the requirements, the value of AVE > 0.5, ranging from 0.514 to 0.697.

To test the validity measurement, factor analysis is used by using the result of cross loadings. The loadings factor are considered adaptable (0.55–0.62), very good (0.63–0.70), and excellent (above 0.71) (Ghozali, 2006). Discriminant validity was measured by examining the loadings to indicate that the value in the same construct correlates highly amongst themselves. Table 5 indicates that the bold values are higher than across the column. Thus, all items indicate that the loadings value higher than the acceptable level. The result is as follow (Table 5).

Table 5. The values of cross loading

Indikator	X1	X2	Y	Z
X1.1.1	**0.742**	0.021	0.078	0.113
X1.1.2	**0.527**	-0.005	0.008	-0.052
X1.2.1	**0.726**	0.084	0.147	0.152
X1.2.2	**0.791**	-0.022	0.122	0.074
X1.3.1	**0.753**	-0.096	0.109	0.041
X1.3.2	**0.818**	-0.068	0.091	0.118
X1.4.1	**0.73**	-0.163	0.058	0.062
X1.4.2	**0.605**	-0.153	0.054	0.05
X2.1.1	-0.061	**0.716**	0.134	0.246
X2.1.2	0.005	**0.898**	0.304	0.305
X2.2.1	-0.057	**0.907**	0.328	0.306
X2.2.2	-0.042	**0.804**	0.211	0.252
Y.1.1	0.027	0.047	**0.665**	0.393

Y.1.2	0.19	0.195	**0.692**	0.475
Y.2.1	0.15	0.184	**0.91**	0.737
Y.2.2	0.059	0.434	**0.777**	0.692
Z.1.1	0.059	0.434	0.777	**0.692**
Z.1.2	0.154	0.134	0.485	**0.809**
Z.2.1.	0.118	0.12	0.372	**0.806**
Z.2.2	0.122	0.104	0.347	**0.732**
Z.3.1	0.173	0.176	0.501	**0.807**
Z.3.2	0.109	0.127	0.375	**0.81**
Z.4.1	0.072	0.362	0.747	**0.751**
Z.4.2	0.079	0.258	0.661	**0.676**

Source: Data processed (2019)

Table 5 shows that overall, the loading factor value in the instrument is higher than the cross correlation on other variables. Thus, the instrument can be assumed to be able to measure latent variables.

The second stage is assessing the construct reliability by measuring the value of Alpha Cronbach (> 0.6), and Composite Reliability (0.7). the results are presented as follows (Table 6).

Table 6. The values of construct realiability

Variables	Alpha Cronbach	Cut off	Composite Reliability	Cut off	Inf.
Conpensation (X1)	0.874	0.7	0.893	0.7	Reliabel
Work Environment (X2)	0.856	0.7	0.901	0.7	Reliabel
Job Satisfaction (Z)	0.904	0.7	0.917	0.7	Reliabel
Employee performance (Y)	0.766	0.7	0.849	0.7	Reliabel

Source: Data processed (2019)

Table 6 shows that the Cronbach alpha value for all variables is greater than 0.7, compensation (0.874), work environment (0.856), job satisfaction (0.904), and employee performance (0.766). Meanwhile, for the composite reliability value of each variable are compensation (0.893), work environment (0.901), job satisfaction (0.917), and employee performance (0.849). The reliability composite value also exceeds 0.7. Thus, the instrument can be declared reliable.

4.2 Goodness of fit model
The next step is the measurement of the Goodness of fit model (GFM). GFM is used to validate that the endogenous variables can clarify the diversity of exogenous variables. To find out the contribution of exogenous variables to endogenous variables, here is based on the Q2 value (Q-square predictive relevance) as shown in the following table 7.

Table 7. The Goodness of Fit Model

Variables	R^2
Employee Performance	0.612
Job Satisfaction	0.135
$Q^2 = 1 – (1 – R1^2) \times (1 – R2^2)$	
$Q^2 = 1 – (1 – 0.612) \times (1 – 0.135)$	
$Q^2 = 1 – 0.335$	
$Q^2 = 0.665$	

Source: Data processed (2019)

The R2 value of the employee performance variable is 0.612 or 61.2%. This means that employee performance variables can be explained by compensation, work environment, and job satisfaction variables by 61.2%. Then, the contribution of other variables that were not a concern in this study was 38.8%. Meanwhile, the R2 value for the job satisfaction variable is 0.135 or 13.5% in percentage. This shows that the variable of job satisfaction can be described by the variable compensation, and the work environment by 13.5%. Meanwhile, the remaining 96.5% is contributed by other variables that not be covered by this study.

The diversity of employee performance variables that can be explained in this study model is seen from the Q2 (Q-Square Predictive Relevance) value of 0.665 or 66.5%. While the remaining 33.9% is contributed by other variables that are not a concern in this study. Thus, the exogenous variable contributes to endogenous variable is 66.5%.

4.3 Structural model

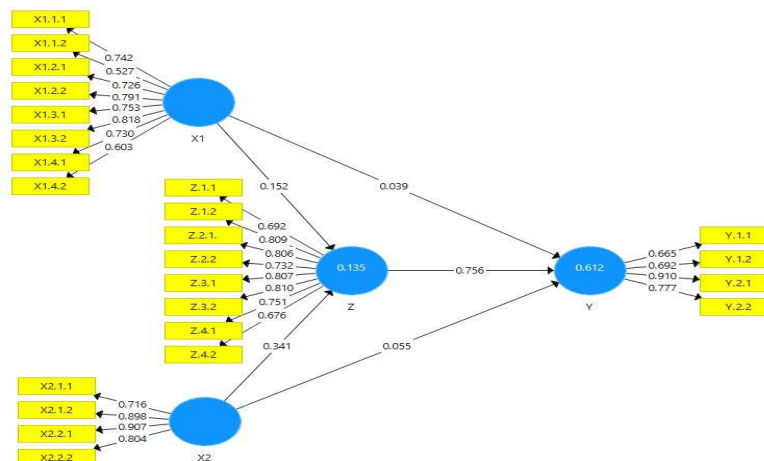
The next model being tested is the Structural Model. The value of each path coefficient is measured by bootstrapping with 5000 samples using the replacement method. Hypothesis testing is projected to test and find out whether there is an influence between variables developed in the model. This test refers to the T-statistic value, where if the T-statistic value exceeds the T-Table (1.96), the hypothesis is accepted. The results are presented in Figure 2 and table 8 as follows.


Fig. 2. Path Diagram
Source: Data processed (2019)

744

Tables 8. The result of hypotheses testing

Hypoteses	Effects	Coefficient	T-Statistic	Inf.
1	X1 → Y	0.039	1,571	Insignificance
2	X1 → Z	0.152	1.382	Insignificance
3	X2 → Y	0.055	5.501	Significance
4	X2 → Z	0.341	6.007	Significance
5	Z → Y	0.756	27.901	Significance
6	X1 → Z → Y	0.115	1.391	Insignificance
7	X2 → Z → Y	0.258	6.381	Significance

Source: Data processed (2019)

Figure 2 and Table 8, in general, show that compensation (X1) either directly or indirectly has no impact on job satisfaction (Z) and employee performance (Y). In contrast, work environment (X2) has a direct and indirect impact on job satisfaction (Z) and employee performance (Y). Furthermore, it indicates that Job satisfaction (Z) cannot mediate the compensation (X1) and employee performance (Y). However, it can mediate the correlation between work environment (X2) and employee performance (Y).

4.4 Compensation, job satisfaction, and employee performance

Figure 2 and Table 8 show that the coefficient of compensation for employee performance has a positive value of 0.039 and has a T-statistic of 1.571. This indicates compensation has a positive relationship, but does not significantly influence employee performance. This is because the T-statistic value is smaller than the T-table value, which is 1.571 <1.96. Thus, H1 is rejected.

This finding indicates that employees at the polytechnic college feel quite satisfied with the compensation given. This is indicated by the high respondents' assumptions about the incentives that have been made by polytechnic colleges. In addition, this finding also claims that the high compensation of employees in polytechnic colleges does not make employees have high performance. Thus, they assume that there are other factors that can be a major cause in improving employee performance, such as discipline, work culture, leadership and others.

Compensation positively related to job satisfaction (Coefficience = 0.152), but it is not significant with the variable Job Satisfaction (T-statistic = 1.382). The T-statistic value is smaller than the calculated T-ratio of 1.382 <1.96. Thus, H2 is rejected. Compensation provided by polytechnic colleges does not provide job satisfaction for employees. One reason is because employees consider compensation as an organizational obligation that must be given to employees. Hence, job satisfaction cannot be determined by the compensation given by the organization.

The job satisfaction (as a mediating variable between compensation and employee performance) has no significant effect. This is indicated by the results of the path coefficient of 0.115 and the value of T-Statistics of 1.391, the value of T-Statistics is smaller than the value of T-table. Therefore, the third hypothesis is rejected.

Compensation also includes all forms of tangible services, benefits received by employees as part of a work relationship, and financial returns (Simamora, 2006). Employee sacrifice can be in the form of work, performance services, costs, or the effort spent to achieve certain goals set by the company. Job satisfaction is one important aspect in the practice of organizational behavior and human resource management. This is because job satisfaction provides happiness, morale, and employee motivation in increasing productivity (Mabaso & Dlamini, 2017; Zhang et al., 2018).

The findings of this study are supported by research in Kenya that teachers feel very unhapppy with all aspects of financial and non-financial compensation received. However, the basic salary, benefits and work environment greatly affect teacher job satisfaction (Muguongo et al., 2015). Satisfaction of sales results also does not impact on employee performance in insurance companies (El Samen & Akroush, 2018). In addition, the financial benefits obtained as a company compensation lead to high employee satisfaction and high performance at other service companies such as hotels (Che Ahmat et al., 2019; Patiar & Wang, 2020).

This study proves findings that are a quite different from previous studies which prove the links of compensation, satisfaction, and performance. Compensation affects employee performance (Anderson et al., 2018; Buachoom, 2017; Salisu et al., 2015). In addition, Industrial employees in Ethiopia are satisfied with the compensation payments they receive, which increases the performance of employees (Addis et al., 2018). Increased compensation provides a significant effect on employee satisfaction which has an impact on increasing employee performance (Chong & Leung, 2018; Jiang & Zhang, 2018; Martinson & De Leon, 2018). The importance of the Islamic work ethic that is applied in organizations gives intrinsic motivation and employee work attitudes such as organizational commitment and satisfaction, thereby it could increase employee performance in the organization (Kataria et al., 2019).

4.5 Work environment, job satisfaction, and employee performance

Figure 2 and table 8 also describe the coefficient value of the work environment variable on employee performance of 0.055 with a positive value and has a T-statistic of 5.501. This shows that the link of work environment variables and employee performance is a positive and significant. Similarly, the path coefficient value of the work environment and job satisfaction of 0.341 and T-Statistics 6.007. Thus, the work environment and job satisfaction is positively and significantly correlated. Both have T-Statistics values greater than T-statistics with 5.501> 1.96, and 6.007> 1.96. With regard to the results of testing this hypothesis, it shows that the better working environment will improve employee performance and increase employee job satisfaction. Therefore, hypothesis 4 and hypothesis 6 in this study were accepted.

Job Satisfaction as a mediating variable is also significant. This is indicated by the results of the path coefficient of 0.258 and the T-Statistics value of 6.381. The T-Statistics value is smaller than the T-table value. This means that job satisfaction for employees in polytechnic colleges positively and significantly affect work environment and employee performance.

This finding supports several previous studies related to the link of work environment, job satisfaction, and employee performance. Previous research has shown that the correlation among work environment, employee satisfaction and performance in educational institutions, the banking sector, and the telecommunications industry in Pakistan is significant. The work environment and job satisfaction also positively correlated (Raziq & Maulabakhsh, 2015). Managers recognize the essential of a virtuous work environment to make best use of the level of job satisfaction. The researchs of Jain and Kaur (2014) and Muguongo, et al. (2015) also found that work environment influence the job satisfaction. The banking industry in India proves that the work environment that is not conducive negatively affect on employee satisfaction resulting in declining employee performance (Dhamija et al., 2019).

4.6 Job satisfaction and employee performance

The result of the effect of job satisfaction on employee performance, as shown in figure 2 and table 8, indicates that the two variables positively and significantly related each other (Coefficient Value 0.756; T-Statistic 27,901> 1.96). Job satisfaction felt by employees will increase along with the increase in employee performance in polytechnic colleges. Therefore, hypothesis 7 in this study was accepted.

The findings support previous research in job satisfaction and employee performance (Amiroso & Mulyanto, 2015; Chong & Leung, 2018; Dhamija et al., 2019; Jiang & Zhang, 2018; Kataria et al., 2019; Martinson & De Leon, 2018). To improve overall performance, managers target and focus on the welfare of their employees so as to encourage employees to work better. This is an effort to satisfy the workers (Shahzad et al., 2018).

Job satisfaction is one important aspect in the practice of organizational behavior and human resource management. It means that job satisfaction can affect happiness, morale, and employee motivation in increasing productivity (Mabaso & Dlamini, 2017). Owusu (2014) states that job satisfaction is a feeling of preference or satisfaction with one's work or experience at work. This condition, according to him, can lead employees to a condition where they can improve their performance level. Meanwhile, in different conditions such as feeling displeased or emotionally dissatisfied at work, it can cause low performance of employees. Meanwhile, on the other hand, high performance is very important for the organization to achieve what has been the goal.

5. Conclusions

This study shows that compensation, satisfaction and performance are not correlated positively. In addition, job satisfaction as a mediating variable in compensation and employee performance is not proven. This means that even though compensation is increased for employees it doesn't improve their performance. It is because some employees consider that giving compensation by the organization is an obligation and a necessity for what employees give to the organization. State Polytechnic is expected to focus more on the work environment to improve employee performance. The current work environment in polytechnics both physically and non-physically is considered equally important by employees. To improve employee satisfaction, the work environment has proven to be a trigger for employees to feel satisfied with what they have been doing so that they will work more effectively and efficiently in helping the organization achieve its goals. The role of job satisfaction as compensation mediation on employee performance has been proven to have no effect either partially or simultaneously. Meanwhile, job satisfaction as a mediator in work environment and employee performance is proven positively and significantly. This shows that the work environment can improve employee performance both directly and indirectly through job satisfaction.

CRITICAL FACTORS AFFECTING LABOR PRODUCTIVITY WITHIN CONSTRUCTION PROJECT IMPLEMENTATION: A PROJECT MANAGER'S PERSPECTIVE

Nguyen Quoc Toan [1*], Nguyen Van Tam [2], Dinh Tuan Hai [3], Nguyen Le Dinh Quy [4*]

Abstract. The present study aims to identify critical factors affecting labor productivity within the construction project implementation from the project manager's viewpoint. By a comprehensive review of the previous studies, this study identified 45 critical factors impacting construction labor productivity, which were grouped as primary 6 groups include: manpower, management, work condition, project, and external factors. A total of 56 valid samples were collected by 65 project managers' respondents who completed a structured questionnaire survey according to their previous participation in or directly implementation construction projects. These critical factors were ranked based on their relative important index and descriptive statistics (i.e. mean and standard deviation). The analysis of the identified critical factors indicated that the most significant critical factors impacting construction labor productivity are 'ability of construction management, 'financial status of stakeholders', 'work discipline', 'design changes', 'timeliness of remuneration', 'economic conditions', 'lack of supervision', 'accident', 'availability of labors', and 'availability of materials'

Keywords: critical factors; labor productivity; construction project implementation; affecting; project managers

1. Introduction

For the economy of any country, the value of the construction industry has a significant contribution to the nation's gross domestic product. Despite the applied technological advancements, the construction industry remains a human-intensive industry (i.e. dependent upon effort and performance of the workforce) (Jarkas et al., 2014). Therefore, labor productivity plays a key role in assessing the success of construction projects which reflects the significant effect of this resource in the construction sector, meaning that any enhancement in labor productivity will contribute a high deal to enhance the project effectiveness (i.e., quality, cost, and time performances) (Mahamid, 2013b). In many countries, the construction labor cost would account for between 30% and 50% of the total cost of a construction project, so construction labor productivity as a determinant impacting almost construction projects' profitability (El-Gohary and Aziz, 2014, Hanna et al., 2002, McTague and Jergeas, 2002). Improving labor productivity seems is one of the most important objectives for any organization due to the fact it displays the efficiency and effectiveness conversion of sources into marketable merchandise and it determines commercial enterprise profitability (Wilcox et al., 2000). In this regard in the field of construction, many researchers have been conducted to purpose improvement labor productivity of construction practitioners (i.e., construction managers, engineers, architectures, and builders). Poor construction labor productivity is a major cause of influencing the quality, duration, and cost of construction projects (Mahamid, 2013b). Also, previous studies indicated that the loss of construction labor productivity is affected by various factors related to workforce, management, equipment and tools, materials, technology, and environment (Mustapha and Naoum, 1998, Van Tam et al., 2018, Enshassi et al., 2007, Alaghbari et al., 2019). However, perception of what factors affecting construction labor productivity may different depending on the roles of respondents in the construction project implementation (Perera et al., 2014). Therefore, the aim of this study is that identify and assess the critical factors impacting labor productivity within construction investement project implementation on basis of the awareness of project managers. The findings are expected to build a platform to implement better appropriate tasks towards improving construction labor productivity.

2. Literature Review

Productivity has been calculated is the ratio of the produced-outputs to the inputs that used to create the outputs (Coelli et al., 2005). In the construction context, construction labor productivity has been calculated is the rate of between the work units accomplished (i.e., outputs quantity) and the work hours (i.e., inputs for labors) (Ghoddousi and Hosseini, 2012, Enshassi et al., 2007). To enhance construction labor productivity, identifying critical factors that have influence labor productivity in the organization of construction projects is necessary. Therefore, various factors impacting labor productivity in the construction sector have been proposed and categorized by numerous scientific researchers from different countries as represented in the previous researches.

The studies of (Lim and Alum, 1995) conducted in Singapore that indicated that the most factors impacting construction labor productivity include difficult with the manpower recruitment, on-site supervisors recruitment, high labor income rate, construction site absenteeism, and problems of communication with oversea construction workers, whereas, in Saudi Arabia, top five factors include workforce experience and skills, lack of communication by construction stakeholders, poor relations between employees and their managers, timeliness of remuneration, and schedule delay (Mahamid et al., 2013). In Iran construction industry, (Zakeri et al., 1996) stated that lack of materials, severe weather and on-site conditions, low quality of equipment and tools, drawing quality, change orders, and proper equipment shortages which were the most factors impacting labor productivity, while, as shown in the research of (Jarkas et al., 2012), the top critical factors that have an important effect on construction labor productivity in Qatar such as supervision, labor skills, lack of materials, lack of experienced labor, communication, shortage of leadership of construction managers, high-temperature, delays in responding to "Requests For Information", shortage of providing labor with transportation, and percentage of work subcontracted.

(Alaghbari et al., 2019) studied factors impacting construction labor productivity in Yemen, the studies classified a total of 52 factors into four main categories that are human/labor group (8 factors), management group (17 factors), technical and technological group (12 factors), and external group (15 factors). In Bahrain, (Jarkas, 2015) grouped 37 factors into 4 primary categories that are management (19 factors), technological (11 factors), labor (3 factors), and external (4 factors), while (Jarkas et al., 2015) stated that there were 33 factors affecting construction labor productivity in Oman, which grouped into 4 four categories, including management (13 factors), technological (12 factors), labor (3 factors), and exogenous (5 factors). A total of 45 factors impacting labor productivity in building projects in the Gaza Strip were proposed by (Enshassi et al., 2007), who categorized these factors into 10 groups that are manpower (10 factors), leadership (3 factors), motivation (6 factors), time (5 factors), materials/tools (3 factors), supervision (4 factors), project (4 factors), safety (7 factors), quality (3 factors), and external (2 factors). The study of (Hiyassat et al., 2016) was conducted in Jordan, which indicated that 27 variables influencing construction labor productivity that were categorized by dimensions such as by dimensions such as creating a plan, the relations between craftsman and managers, education levels and labor experience, climate conditions, adopted technology, labor motivation, safety conditions, worker personal problems, and impact of religion.

In many years, the topic of factors influencing construction labor productivity has been concerned by numerous researchers. Consequently, various critical factors influencing construction workforce productivity have been demonstrated and grouped by lots of studies from many countries. However, the frequency and impact levels of these critical factors quite different from project to project or nation to nation, and even in the same construction project, depending on specific situations (Olomolaiye et al., 1998). Therefore, a task to divide these factors toward major global categories, it may relate and enclose to the numerous factors is critical. Based on referencing and considering previous studies, the present study synthesized critical factors impacting labor productivity in the construction implementation. A total of 45 critical factors influencing labor productivity within construction project implementation, which are divided into six categories as follows: (1) manpower (7 factors), management (13 factors), motivation (8 factors), work condition (5 factors), project (7 factors), and external (5 factors).

3. Research Methodology

The present study was carried out based on a questionnaire survey aimed at effectively collecting all the necessary data. As mentioned above, a total of 45 factors that impact labor productivity within the implementation of construction projects were identified. These factors were then tabulated in the form of a questionnaire.

The questionnaire survey was contained two major parts. The structured first part contains demographic information on the participants (i.e., education levels, qualifications, positions, and professional experience) whose main objective was to illustrate the participants in order to ensure reliability in this study outcomes. The structured second part contained the list of these identified factors. To collect needed data, participants were surveyed for interviews on the basis of their previous take part in or directly implementation construction investment projects in Vietnam. Based on their experience, they will assess the impact degree of the critical factors construction labor productivity following a 5-point Likert scale (i.e.,1-Very low effect, 2-Low effect, 3-Moderate effect, 4-High effect, 5-Very high effect).

For analyzing data, this study used the Relative Importance Index (RII) approach to evaluate the levels of impact of these critical factors influencing labor productivity within the construction project implementation. The RII method was adopted by numerous studies (i.e., (Alaghbari et al., 2019, Jarkas, 2015, Jarkas et al., 2012, Hiyassat et al., 2016, Gunduz and Abdi, 2020). The RII index was assessed based on the below formula 'Eq. (1)' as follows:

$$RII = \frac{\sum_{i=1}^{5} W_i \times X_i}{5 \sum_{i=1}^{5} X_i} \qquad (1)$$

Where: W_i is the rating given to factor by the respondent ranging from one to five; X_i is the proportion of respondents scoring; i is the order score ranging between one and five.

Responses from the first part can be obtained through the appropriate response choice. In the second part participants needed to assess the factors that influence construction labor productivity on a Likert scale from 1 (very low influence) to 5 (very high influence). The RII index is applied to evaluate these factors influencing construction labor productivity as perceived by the participants and, therefore, a comparative analysis is possible.

The collection of case-specific data was conducted by respondents who engaged with construction projects in Vietnam and working as project managers. A total of 73 samples were distributed by email and face-to-face interviews. Only 65 answers were received, and 56 qualified responses for research, representing an effective rate of 76.7%.

4. Results and Discussions

In the present study, there are two software applications were applied to examine the findings, which are MS Excel 365 and SPSS 22. A total of 45 critical factors affecting labor productivity within construction project implementation have been identified and ranked on the basis of their descriptive statistics (i.e., mean and standard deviation), and the RII index.

4.1. Manpower factors group

Table 1: Ranking of factors under manpower group

Factors	M	SD	RII	Rank
Work discipline	3.946	0.840	0.789	1
Labors' experience and skills	3.821	1.081	0.764	2
Age of labors	3.714	1.124	0.743	3
Strength and physical of labors	3.714	1.091	0.743	4
Absenteeism	3.696	1.094	0.739	5
Labor's education level	3.536	0.934	0.707	6
Personal problems	3.429	1.093	0.686	7

Note: M is Mean, SD is Standard Deviation, and RII is Relative Importance Index

Table 1 indicates the ranking of 7 factors related to the manpower category. The results statistics of project managers' respondents indicate that 'work discipline' with RII=0.789 was ranked the 1st in this group and ranked 3th in the overall ranking (Table 8), which proves that this factor has a very high impact on labor productivity within construction project implementation. This finding in the line with some previous studies (i.e., (Van Tam et al., 2018, Durdyev and Mbachu, 2011, Enshassi et al., 2007, Gerges et al., 2011). With RII=0.764, 'labors' experience and skills' factor was ranked 2nd in this group and assessed 12th among all 45 factors, which indicates that the factor has a high influence on labor productivity. Followed by 'age of labors' (RII=0.743), 'strength and physical of labor' (RII=0.743), 'Labor absenteeism' (RII=0.739) was ranked 3rd, 4th, and 5th respectively in the category. Finally, 'labor's education level' (RII=0.707), and 'personal problems' (RII=0.686) was assessed at the end of manpower group, and ranked 33rd, 39th in overall ranking respectively, which shows that these factors have a low impact on labor productivity within construction project implementation.

4.2. Management factors group

The ranking of 13-factor under management category was provided in Table 2, with RII=0.814, the surveyed project managers ranked 'ability of construction management' it the 1st in this group. This factor was also assessed is the first factor among 45 critical factors, which proves that this factor has a very high effect on labor productivity within construction project implementation. This evidence was further supported by (Ghahramanzadeh, 2013), who stated that project managers' incompetence is one of the serious issues barrier the labor productivity improvement in the Iran construction sector. The ranking is also in line with the study by (Ghoddousi and Hosseini, 2012), which showed that the competence of project managers as an important factor impacting the labor productivity of construction projects.

Table 2: Ranking of factors under management group

Factors	M	SD	RII	Rank
Ability of construction management	4.071	0.850	0.814	1
Financial status of stakeholders	3.982	0.963	0.796	2
Lack of supervision	3.875	0.634	0.775	3
Availability of labors	3.857	0.819	0.771	4
Availability of materials	3.839	1.156	0.768	5
Site management	3.714	1.074	0.743	6
Rework	3.679	1.309	0.736	7
On-site storage	3.679	1.011	0.736	8
Availability of equipment/tools	3.643	1.212	0.729	9
Lack of supervisors' experience	3.554	1.043	0.711	10
Working overtime	3.518	1.128	0.704	11
Communication	3.482	1.206	0.696	12
Construction methods	3.375	1.169	0.675	13

With the RII ranging between 0.796 and 0.768, four factors have a significant effect on construction labor productivity such as 'financial status of stakeholders', 'lack of supervision', 'availability of labors', and 'availability of materials' which ranked 2nd, 3rd, 4th, and 5th in this ground and evaluated 2nd, 7th, 9th, and 10th among al critical factors, in turn. In fact, construction activities are implemented with many resources, one of which financial, labors, materials play an important role. Many buildings needed a large amount of capital and almost of contractors perceive it exceptionally troublesome to bear the high daily execution expenses in the case of laborers' salaries are delayed (Mahamid, 2013a). The outcomes of researches (i.e., (Hai and Van Tam, 2019, Alinaitwe et al., 2007, Kadir et al., 2005), which demonstrated that the limitation of finances as a problem in improving labor productivity. With the RII ranging between 0.704 and 0.675, the surveyed project managers ranked three factors are 'working overtime', 'communication', and 'construction methods' at the end of this group, which reveals that three factors have a very low influence on construction labor productivity.

4.3. Motivation factors group

Table 3 provides the ranking of factors relevant to the motivation category, 8 critical factors are identified under this group. The surveyed respondents ranked factors of 'timeliness of remuneration' (RII=0.782) and 'amount of remuneration' (RII=0.764) were ranked the first and the second in this category, and assessed the 5th, and 11th overall ranking, respectively. The finding indicates that these factors as determinants impact on construction labor productivity. This ranking was supported by the studies of (Ghoddousi et al., 2014, Tabassi and Bakar, 2009), which explained that managers are the good perception that construction craftsman still has to face with low salary, which has been identified as a problem in many countries and late payments have a dramatic effect on the main aspects of productivity in the construction sector (Tam et al., 2004, Jarkas and Radosavljevic, 2013, Perera et al., 2014, Kaliba et al., 2009).

Table 3: Ranking of factors under motivation group

Factors	M	SD	RII	Rank
Timeliness of remuneration	3.911	0.880	0.782	1
Amount of remuneration	3.821	1.011	0.764	2
Work satisfaction	3.804	1.313	0.761	3
Promote opportunities	3.732	1.228	0.746	4
Rewards/Punishments	3.679	1.309	0.736	5
Motivation of laborers	3.589	1.290	0.718	6
Lack of labor recognition programs	3.375	1.001	0.675	7
Creating competition	3.339	1.405	0.668	8

With the RII ranging between 0.761 and 0.736, three factors have a significant impact on labor productivity in construction project implementation such as 'work satisfaction', 'promote opportunities', and 'rewards/punishments' which ranked 3rd, 4th, and 5th in this category and 13th, 16th, and 26th among 45 critical factors, respectively. Finally, factors of 'motivation of laborers', 'lack of labor recognition programs', and 'creating competition' were ranked at the end in the motivation group, with RII are 0.718, 0.675, and 0.668 respectively. The ranking reveals that this 3-factor has a low effect on construction labor productivity.

4.4. Work condition factors group

As demonstrated in Table 4, with RII=0.786, the analysis result indicated that 'accident' factor was ranked the 1st in this group and the 8th overall ranking, which shows that the factor has a very high impact on labor productivity within construction project implementation. Followed by the factor of 'healthy and safety conditions' (RII=0.754) was assessed the second in the work condition group and 14th among all factors, which reveals that this factor as a determinant on construction labor productivity. The evidence in the line with the outcomes of some previous studies (i.e., (Ghoddousi et al., 2015, Ghoddousi and Hosseini, 2012), which explained that the construction industry is knowns for its poor working conditions and the adoption of health and safety measures in several developing countries.

In this category, the factor of 'working security' (RII=0.746) was ranked the 3rd in this category and 15th among 45 factors, whereas 'working space' (RII=0.707) was ranked the 4th under work condition group and 25th overall ranking. With RII=0.682, 'height of work site' was evaluated at the end of this group and 40th among all factors. This ranking indicates that the factor has a very low impact on construction labor productivity.

Table 4: Ranking of factors under work condition group

Factors	M	SD	RII	Rank
Accident	3.857	0.943	0.771	1
Healthy and safety conditions	3.768	1.009	0.754	2
Work security	3.732	0.963	0.746	3
Working space	3.536	0.852	0.707	4
Height of work site	3.411	1.092	0.682	5

4.5. Project factors group

Table 5 demonstrates the ranking of factors relevant to the project group, 7 critical factors are identified under this category. With RII=0.786, the surveyed respondents ranked 'design changes' is the 1st position in this group and the 4th among 45 critical factors, which indicates that this factor has a significant impact on labor productivity within construction project implementation. This ranking was further supported by the study of (Enshassi et al., 2007), which demonstrated that specification alteration during the construction project organization was the primary factor impacting labor productivity.

Table 5: Ranking of factors under project group

Factors	M	SD	RII	Rank
Design changes	3.929	0.871	0.786	1
Effective project	3.696	0.913	0.739	2
Drawing quality	3.679	0.855	0.736	3
Project location	3.571	1.024	0.714	4
Design complexity	3.554	1.111	0.711	5
Sub-contractor	3.446	1.174	0.689	6
Project type	3.250	1.014	0.650	7

With the RII ranging between 0.739 and 0.714, three factors have a significant effect on construction labor productivity such as 'effective project s', 'drawing quality', and 'project location' which ranked 2nd, 3rd, and 4th under project category and assessed 20th, 23th, and 30th overall ranking, respectively. Finally, critical factors such as 'design complexity' (RII=0.711), 'sub-contractor' (RII=0.689), and 'project type' (RII=0.650) were ranked at the end of this category. The ranking reveals that these factors have a low influence on labor productivity within construction project implementation.

4.6. External factors group

Table 6: Ranking of factors under external group

Factors	M	SD	RII	Rank
Economic conditions	3.893	0.966	0.779	1
Weather conditions	3.679	1.377	0.736	2
Regulation and law	3.607	1.139	0.721	3
Social culture	3.482	0.934	0.696	4
Geological and hydrological conditions	3.375	1.169	0.675	5

The results of Table 6 indicate that 5-factor of the external group has been ranked by the RII index under perceptions of project managers. The surveyed respondents evaluated 'economic conditions' (RII=0.779) was the first in this category and ranked sixth overall ranking, which indicates that the factor as a determinant having a significant influence on labor productivity in the construction project implementation. Followed by factors of 'weather conditions'(RII=0.736), and 'regulation and law' were assessed the second and third positions in the group and 24th and 28th among 45 identified factors, respectively. The finding was supported by studies of (Kaming et al., 1997, Van Tam et al., 2018), which demonstrated that construction activities are significantly impacted by weather conditions. Finally, with RIIs are 0.696 and 0.675, 'social culture' and 'geological and hydrological conditions' were ranked at the end of this group, which proves that these two factors have a low impact on construction labor productivity.

4.7. Overall ranking critical factors influencing labor productivity within construction project implementation

The overall perceived impacts of all 45 factors were shown in Table 7. As provided, the top five ranking critical factors influencing labor productivity within construction project implementation as follows: 'ability of construction management, 'financial status of stakeholders', 'work discipline', 'design changes', 'timeliness of remuneration', 'economic conditions', 'lack of supervision', 'accident', 'availability of labors', and 'availability of materials'. The ranking reveals that the top ten factors have a significantly important impact on construction labor productivity.

Table 7: Overall ranking critical factors influencing labor productivity within construction project implementation

Factors	M	SD	RII	Rank
Ability of construction management	4.071	0.850	0.814	1
Financial status of stakeholders	3.982	0.963	0.796	2
Work discipline	3.946	0.840	0.789	3
Design changes	3.929	0.871	0.786	4
Timeliness of remuneration	3.911	0.880	0.782	5
Economic conditions	3.893	0.966	0.779	6
Lack of supervision	3.875	0.634	0.775	7
Accident	3.857	0.943	0.771	8
Availability of labors	3.857	0.819	0.771	9
Availability of materials	3.839	1.156	0.768	10

Factors	M	SD	RII	Rank
Amount of remuneration	3.821	1.011	0.764	11
Labors' experience and skills	3.821	1.081	0.764	12
Work satisfaction	3.804	1.313	0.761	13
Healthy and safety conditions	3.768	1.009	0.754	14
Work security	3.732	0.963	0.746	15
Promote opportunities	3.732	1.228	0.746	16
Age of labors	3.714	1.124	0.743	17
Strength and physical of labors	3.714	1.091	0.743	18
Site management	3.714	1.074	0.743	19
Effective project	3.696	0.913	0.739	20
Absenteeism	3.696	1.094	0.739	21
Rework	3.679	1.309	0.736	22
Drawing quality	3.679	0.855	0.736	23
Weather conditions	3.679	1.377	0.736	24
On-site storage	3.679	1.011	0.736	25
Rewards/Punishments	3.679	1.309	0.736	26
Availability of equipment/tools	3.643	1.212	0.729	27
Regulation and law	3.607	1.139	0.721	28
Motivation of laborers	3.589	1.290	0.718	29
Project location	3.571	1.024	0.714	30
Design complexity	3.554	1.111	0.711	31
Lack of supervisors' experience	3.554	1.043	0.711	32
Labor's education level	3.536	0.934	0.707	33
Working space	3.536	0.852	0.707	34
Working overtime	3.518	1.128	0.704	35
Social culture	3.482	0.934	0.696	36
Communication	3.482	1.206	0.696	37
Sub-contractor	3.446	1.174	0.689	38
Personal problems	3.429	1.093	0.686	39
Height of work site	3.411	1.092	0.682	40
Lack of labor recognition programs	3.375	1.001	0.675	41
Geological and hydrological conditions	3.375	1.169	0.675	42
Construction methods	3.375	1.169	0.675	43
Creating competition	3.339	1.405	0.668	44
Project type	3.250	1.014	0.650	45

5. Conclusions and recommendations

The present study aimed to identify a total of 45 critical factors influencing labor productivity within construction project implementation, which were grouped into the main 6-category that are manpower, management, work condition, project, and external factors. The data was collected by 56 valid surveyed questionnaires with participants of construction project managers, and critical factors were ranked based on their RII index and descriptive statistics. The results highlight the primary factors impacting construction labor productivity in construction projects as perceived by project managers, including 'ability of construction management, 'financial status of stakeholders', 'work discipline', 'design changes', 'timeliness of remuneration', 'economic conditions', 'lack of supervision', 'accident', 'availability of labors', and 'availability of materials'.

On the basis of the findings, the following recommendations are suggested as a way to improve labor productivity within the construction project implementation.

1. Project management unit should encourage construction project managers to learn practical skills and real experience about construction management through programs of regular training the help them to keep up to date and aware of valuable project management skills that have to be enhanced.

2. The project management unit should create workshops and training courses to help project managers to improve the managerial experience and skills as well as keep management activities on construction sites to enhance quality and prevent incorrect productions.

3. It is necessary owners should pay progress payment to contractors on time because it affects the contractors' ability to finance the work, leading to a shortage in materials and delay payments to laborers which affect their motivation to work.

4. The project management unit should introduce regulations and rules in the working environment to control the work discipline of the construction workforce. Besides, it is necessary to create recognition programs (i.e. rewards or punishment) to encourage laborers to keep their discipline on site which also makes significant restriction accidents in the construction project implementation.

5. Project managers should supervise and control materials supply for each specific construction project. This schedule should involve the time required to supply materials and the materials available on the local market to supply the required materials in time. In addition, the project management unit should require contractors should also select a reasonable storage location for purchased materials in each project, which should be easily accessible and close to implement projects and to avoid wastage of labor time for multiple-handling materials.

6. The project management unit should reduce design changes by the way that strongly controls the quality of drawings at the design stage order to explore errors or conflicts which can restrict reworks. Also, applying for construction management technology advances (i.e., building information modeling-BIM, scan to BIM,...) in the construction project implementation should be encouraged which can lead to improving project performance and profit maximum.

Although some results have been concluded from the present study, the authors encourage other researchers to replicate this topic in many different areas, countries, so that the important factors revealing elsewhere, and the bases platform the related findings can further support to the comprehensive theoretical understanding of the more complex problems of the construction labor productivity topic and the critical factors related with specific socioeconomic conditions and cultural backgrounds.

Abstract. The hospitality industry´s footprint is characterized by heavy resource consumption and significant waste production. Due to the sustainability there is necessary to use triple bottom line approach, to measure hospitality industry impact on people, the planet and profits (3P criteria). The hospitality has improved its efforts to effectively measure and protect natural resources, but P pillar of social sustainability is increasingly highlighting the role of people. Hospitality sector does not publicly report any of the criteria; only the activities associated with social care and overall welfare. Therefore, we researched possibility to use a joint sustainability index to measure the 3Ps for hospitality industries. The results reveal methods, models, inputs, and outcomes and define the users by anticipating their needs in terms of new sustainability measures in the hospitality industry. The results show that the planet category was weighted the highest, the people category was weighted highly for satisfaction, and profit category was weighted on the upper scale during the research period. This contribution employs a hospitality organization model, but the ideas can be extended to whole other types of organizations.

Keywords: People; Planet; Profit; Sustainability index; TBL – Triple Bottom Line, Hospitality

1. Introduction

Sustainability has become a mantra for the 21th Century (Dyllick & Hockerts, 2002). There is exhaustive list of definitions explaining sustainability, the oldest one is from 1972 UN Stockholm conference. "The growth of this broader ´world sustainability' viewpoint can be seen in the number of companies that have begun reporting on more than just financial operations" (Jackson et al., 2011; GRI, 2002). As sustainable management has evolved to span beyond organizational boundaries, firms increasingly realize the importance of TBL embracing (Shou et al., 2019).

The tourism as "green washing" underwent many redefinitions towards wider aspect of sustainability (Lozano-Oyola et al., 2019; Sheldon et al., 2005). Due to the growing importance of sustainability to the hospitality and tourism industry (Boley, 2011), Elkington made well-known model of the "Triple Bottom Line", which measure impact of industries on 3P – People, Planet, and Profit. Its goals and objectives are orientated to the sustainability (Elkington, 1997; Ho & Taylor, 2007). This approach intends also to guide managers towards the sustainable operations, supported by government, since sustainability became an agenda, as part of each company objectives (Dyllick & Hockerts, 2002; Lippman, 2010). Regarding TBL approach, companies add to their traditional economical goals (profit) also goals, orientated to the environmental (planet), social and ethical view (people) (e.g. Dainiené & Dagilené, 2015; Mintz, 2011). To find balance in satisfying every "P" of hospitality life cycle, many challenges arose, all together with ambition of unifying all under joint index. Sustainability in tourism industry is currently indexing the destination, industry, event management, procurement etc. (Janošková & Palaščáková, 2018; Pardo, 2018). But the industry does not index the hospitality organization, not yet considering all aspects of sustainability. Present researches of sustainability in area of tourism are orientated only to the motivations and attitudes of tourism services users (Dinica, 2018; Faux, 2005).

Different development of hospitality and tourism policies became in many ways source of new pressure for creating competitive measurable environment (Khan, 2017). Promoting and realizing unbearable situation with increased waste production challenges in employing and maintaining right people with service focused minds and sufficient business revenues (Lee & Park, 2009). This situation brought another opportunity for creation of new hospitality sustainability indexing, covering all aspects for 3P model under sustainability. Elkington 3Ps serves currently as the referential model of each hospitality company or tourism destination. Stakeholders and shareholders are part of sustainability in form of a produced „carbon footprint", employee happiness index and societal impact reflected in employment, ecology, community service etc. (Elkington, 1997).

Tourism has been defined by the United Nation World Tourism Organization as a social, cultural and economic phenomenon that involves the stay of people in countries and places beyond their standard home for personal or professional purposes (Butzmann & Job, 2017). World Travel and Tourism Council (WTTC) raises awareness of tourism as one of the largest industries supporting 266 million jobs generating 9% of global GDP. Due to the tourism importance to sustainability, we face a large amount of "tourism product" - accommodation and services (UNWTO, 2014). A whole phenomenon of tourism is repeatedly affecting the global environment through people and planet. The society has responded promptly to this growing trend, establishing measurable unit under the term "carbon footprint", directly or indirectly caused by the activity (WTTC, 2018; Lynn, 2009). This lifetime of the product can be incorporated into one common and consistent model, consisting of data from all three dimensions of sustainability. This is presently part of corporate social responsibility (e.g. Fry et al., 2018; Agan et al., 2016; Kang et al., 2010; Antošová & Csikósová, 2016).

Science documented negative impacts of tourism on the environment. The research regards environmental and sustainability considerations. As presented by Willard and Faux nowadays we faced a wave of anti-globalization and a wave of sustainable development and Breakthrough Decade (Willard, 2002; Faux, 2005). The best-known contemporary researcher on sustainable development with a clearly defined model is John Elkington, who found Triple Bottom Line Approach (TBL). This approach represents an effective tool of what sustainable development should be. TBL approach in area of tourism shows how tourism affects both the people who use its services and the people who work there, and to what extent the environment itself and the entire planet is influenced by tourism (Faux, 2005). One of the most challenging aspects of TBL implementing is its. This is associated with developing meaningful social, economic and environmental indicators. The greatest challenge of these is associated with attempting to quantify environmental and social impacts (see, for example Tyrrell et al., 2013; Skouloudis et al., 2009). There is a need to tailor these indicators for specific industry sectors, such as tourism industry, since tourists in different market segments can generate different environmental and social impacts on destinations (Dwyer, 2005). In addition, the term tourism industry contains organizations producing highly heterogeneous products (e.g., accommodations, food services, recreation and entertainment, transportation and travel). This heterogeneity of the tourism sector further complicates the development of universal social and environmental impact measures (e.g. Dwyer & Forsyth, 2008; Slaper & Hall, 2011; Mihalčová et al., 2014).

Despite these difficulties, a review of the existing literature reveals some early attempts to identify meaningful measures of sustainable tourism impact. WTO developed 11 destination-specific core indicators to measure sustainable tourism impact. Indicators include site protection, stress, use intensity, social impact, development control, waste management, planning process, critical ecosystems, consumer satisfaction, local satisfaction, and tourism contribution to the local economy. WTO indicators had been categorized into ecological indicators (site protection, stress, use intensity, waste management and critical ecosystems); social indicators (social impact, local satisfaction); economic indicators (consumer satisfaction and tourism contribution to the local economy); and planning indicators (development control and planning process) (Stoddard et al., 2012; Rogers & Ryan, 2001). The importance of these indicators varied by local authority type: regional councils preferred ecological indicators, territorial local authorities preferred economic indicators, and regional tourism organizations preferred both economic and social indicators. Generalized and global sustainable tourism guidelines could be successfully employed at a local level.

On the other hand, there is a difficulty of sustainable tourism scale development in four areas (Dymond, 1997). First, there is difficulty in differentiating between natural changes versus change that can be attributed to tourism activity. Secondly, tourism impact tends to be measured in one-year or five-year increments. But social or environmental changes take tens of years to manifest. Third, the choice of measures of tourism impact is often subjective in nature and may be based on popular recognition rather than utility. The present study represents the innovative approach to evaluation of sustainability in the hospitality industry. Innovation is made by hospitality sustainability index, with model offering exact categorization of each factor of Elkington 3P model (Elkington, 2004). The use of the model is done by applying multi-criterial decision utilizing AHP matrix. Proposed model of the research realizes that profit is also the pressure created on employee's productivity to deliver forecasted profit that needs to be reflected in the social aspect of the proposed model.

Development and use of the proposed model of sustainability in tourism could be an effective way how to create pressure on business units to satisfy all involved (Lee et al., 2010; Hughes, 2002). It means competitive environment asking for seeking the new ways of improvement and indicator assessing sustainable criteria. By this way model can become part of any free search engine and rating platform, as well as a governmental tool of control.

Due to the mentioned literature review the goal of the contribution is to evaluate sustainable development through triple bottom line in chosen tourism company in Slovakia – Hilton Hotels and Resorts. The choice of this type of tourism organization results from the global brand of full service of Hilton Hotels and Resorts, which presents flagship brand of multinational hospitality company in area of tourism sustainability.

2. Materials and Methods

In general, the most desirable outcome of the research is to find all criteria in perfect balance, when all pillars would be fully satisfied. It presents the index where People satisfaction (stakeholder, employees, and guests), shareholder under Profit pillar, and Planet protection (minimum waste and consumption of resources), would be in the ideal world with 100% satisfaction for each factor and each category, as shown in the following graph at Figure 1.
Fig. 1. HSI general model, graphical display of results in stage of Equilibrium for each category
Source: graph created in Inkscape software

Process of the research can be described by following steps illustrated Figure 2.

1. • Definition of data to be collected and measured, mainly measurement of water consumption, energy consumption and waste production.

2. • Data collection of this research started in 2015 on selected hospitality organization; different types of questionnaires were designed measuring as the guest satisfaction, so the team member satisfaction by online survey called SALT.

3. • Full data collection since 2015 became a platform for model definition and KPIs comparison and finally framed in 2018. Due to the paper extend we show results in 2018 in comparing with results from other years.

4. • Each type of data/factors falling under separate 3P model category, later entering the AHP matrix.

5. • In the second phase of this research, data from 2015 up to 2018 included revenues and profits and they have been processed into proposed sustainability model for the analysed organization by linear conversion.

6. • Third part of the research was defining AHP model as the result of calculation by use of entropy and weights given by an expert, or by end results of above described KPIs representing each of the measured P.

7. • The most desirable outcome is finding all criteria in perfect balance, in the equilibrium, where all pillars and its representatives, would be fully satisfied.

Fig. 2. Process of the research

Key performance indexes (KPIs) of environmental aspect were defined by hotel chains of the world. KPIs consist of the measurement of water consumption, energy consumption and waste production. We considered direct and indirect consumption of waste and water.

Data collection of the research started in 2015; different types of questionnaires were designed measuring the guest satisfaction and the team member satisfaction. The designed questionnaires were distributed by an online survey called SALT (Satisfaction and Loyalty tracker). Full data collection became a platform for model definition and KPIs comparison, and finally framed in 2018. Each data/factors fall under the separate 3P model category, later entering the AHP matrix, for specific definition of different hospitality sustainability indexes.

Entry data and factors defining the "People" category: "People" category data represent findings as people - the guests and people – employees' satisfaction. Guest's satisfaction data was directly gathered from SALT, and data for employee satisfaction from annual TMOS survey (Team Member Opinion Survey).

• Entry data and factors defining the "Planet" category: "Planet" category data represented collection of water and energy consumption and waste production. Due to the data processing we used Lightstay software on a monthly basis. Data were updated and monthly reports figures provided the source data for the proposed model.

• Entry data and factors defining the "Profit" category: When realizing the primary need to get back the investment with further profits, we obtained data on return on investment and other investors KPIs. Justifying profit as the only entry data for this research proposed a model of the hospitality sustainability index calculation would not be complete and correct.

Data from 2015 up to 2018 included revenues and profits. They have been processed into the proposed sustainability model for the analysed organization by linear conversion. That approach was also applied for water

consumption, energy consumption and waste production measures. Only the questionnaires from SALT and TMOS in form of percentage representing total satisfaction have been inserted directly into model for each factor.

Result of the calculation was defining analytic hierarchy process (AHP). It was done by entropy and weights given by experts (e. g. Saaty & Peniwati, 2008; Cingula et al., 2013; Saracoglu, 2013; Crouch & Ritchie, 2005). The next way was to use end results of KPIs representing measured P. The aim was to avoid any doubt of expert judgement choosing and defining weight for each factor. AHP was considered from different perspectives, when formulating the final index. Although the same data will be used, with potentially different weights assigned, results might differ accordingly. With intentionally changed weights of factors entering the AHP, different results might be desired for different user/evaluator/decision maker (Kim et al., 2017).

Therefore, the factors assigned for each category (P) were in calculation either assigned by weight provided by entropy, or by manually assigned weights (expert entries). Those different models served as a base model for the case study. Case study defined a weight of each factor of the model serving the hospitality sustainability index, judged by government/local municipality or client selecting, or employee selecting, employer etc.

To minimize potential manipulation of the model, entry data and weights are numbers (direct results of questionnaires representing, the direct opinion, direct measurement, figures evaluation of the factor). Weights are assigned directly by entropy. Due to the different potential users of Hospitality Sustainability Index (HSI) (represented in one number), the end result is not indicative enough for all parties. This would limit its wide use and ability to provide sufficient information for the decision makers. Based on the multi-criteria evaluation, evaluating the 3P, proposed general HIS index can naturally offer several modifications (weights amended = weight defined).

3. Results

The research results explain and calculate sustainability index in the chosen organization. Weights are calculated by entropy. Due to the contribution extend, we will illustrate results in 2018 (see Table 1.) and compare them with other results from research period.

Table 1. HIS general model, Entropy

3 P	Criteria	3P weights calculated by Entropy	Weights of factors calculated by Entropy	Year End results
People	Employee satisfaction	-	0.877177496	0.803
	Guest satisfaction	-	0.122822504	0.617
Planet	Energy consumption	0.385634353	0.187807589	0.716
	Water consumption	0.424854552	0.422975852	0.817
	Waste consumption	0.189511095	0.389216558	0.805
Profit	Revenues		0.937550464	0.709
	Profit	**HIS 79.611**	0.062449536	0.555

Source: processing in Inkscape software

HSI entropy 2018 with the 79.6 score was allocated with the highest weight - 42% to Planet category. People category with high satisfaction of Employee and Guest, has been given the 2nd highest weight of 38%. Profit is on an upper scale by entropy with weight of 19%, when analysing development from 2015-18 (as shown in Figure 3).
Fig. 3. HIS general model, Entropy, graphical display of results on the 3Ps triangle
Source: processing in Inkscape software

HSI general model from the view of equal weights is given by Table 2.

Table 2. HIS general model, Equal weights

3 P	Criteria	3P weights provided	Weights of factors provided equally	Year End results
People	Employee satisfaction	0.333333333	0.5	0.800
	Guest satisfaction		0.5	0.617
Planet	Energy consumption	0.333333333	0.333333333	0.716
	Water consumption		0.333333333	0.817
	Waste consumption		0.333333333	0.805
Profit	Revenues	0.333333333	0.5	0.709
	Profit	**HSI 70.7**	0.5	0.555

Source: processing in Inkscape software

HSI equal weights model in 2018 with result of 70.7 is in comparison with an entropy model figure lower by 8.46 points. Figure 4 compares the results from the view of entropy and equal weights.
Fig. 4. HIS results – comparison of the Entropy vs. Equal weights allocation
Source: processing in Inkscape software

Almost in all cases method of entropy calculated for HSI higher result than when HSI was provided by calculation with equal weights. For this case, averagely Entropy scored +10 vs. method of equal weights. Only in 2015 equal weights was higher by 22.3 points.

Following are the predetermined HSI users benefiting from proposed basic HSI model:
1. People - as employees (selecting based on HSI their employer).
2. People - as guests (selecting hospitality organization to stay based on guest satisfaction).
3. Profit - as investor (selecting existing hospitality organization as investment).
4. Planet - as natural resources usage (government as regulator).

For calculation of HIS, benchmarking indexes were proposed. They serve as market differentiation and measuring tool for the users:
1. HSI Enviro – Environmental focus.
2. HSI Social – Social focus.
3. HSI Guest – Guest stay focus.
4. HIS Invest – Investment focus.

All indexes are illustrated by Figure 5.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:
@Entrepr69728810
Fig. 5. HIS indexes – Overall performance comparison 2017-2018
Source: authors' calculations, see appendix for further details on data sources

In 2017 Entropy calculated the highest score for performance. It followed by the second HSI Equal weights method. In HSI model, the best performer was HSI Enviro with 71.5. The lowest was HSI Guest with 66.3. Performance in the analysed organization in 2018 received the highest evaluation in HSI Enviro score (72.5) and the worst rating was HSI Guest with 68.4. In general, four years of research measured by entropy, sustainability showed overall the highest scores. According to applied HSI focused indexes, performance varied slightly, but copied same trend in last three years.

4. Discussion, limitations and implications

The question that has to be addressed when considering TBL, is applying to tourism development projects. The question is whether synergies can be achieved between the development tourism organization and the community within which it operates. Dwyer (2005) provided many benefits, which may accrue to the organization of tourism development. Among these benefits belong – marketing, operational, strategy and relational benefits (Skouloudis et al., 2009). Operational benefits refer to cost savings and operating efficiencies. For the tourism organization, TBL can identify potential cost savings. It means enhanced design and operational efficiencies, recycling and waste reuse, reduced operating costs and transportation, etc. Result of the increased sensitivity of tourism organization toward its environmental and social impacts means a better understanding of organization contribution to sustainability. Also human resource costs can be reduced when employees are retained and attracted by an organization that focuses on sustainability. Finally, capital costs may be reduced when the organization has improved access to "ethical" and "green" investment funds.

From marketing perspective, tourism development organizations can benefit from adopting the approach of TBL through improved market positioning (McCool et al., 2001). The result of an improved market positioning can arise when its consumers become aware of the social and environmental sensitivity of the organization (Savitz & Weber, 2006). The adoption of TBL by tourism organizations could result in increased competitive differentiation. This in turn can facilitate the organization's ability to attract new markets as well as encourage

repeated visits. TBL might also benefit the tourism development organization via enhanced stakeholder relationships. TBL approach can improve organization of tourism sustainable development by proper strategic decision-making.

The results of HSI calculations mapped the history and evolving trend applied on the selected hospitality organization. Model with automatic entropy calculation and the model with the adjusted weights proved the different final result. But the joint index reflects how successful the sustainability of selected organization was. The index respects all three basic components or criteria and its representatives. Together with understanding and proven records, use and popularity of AHP model has been used as base of HSI calculation, experts' evaluation and expert judgment of weights. The research also concluded that the standardized approach to each factor data inputs must exist due to the correct results. Probably the biggest challenge in the past was how to unify measuring of water, energy, waste production in different hospitality types. Heating and cooling days are completely different in Africa, comparing with Northern Europe, etc. This demands long-term data collection, with aim to create industry standards. Profit and revenues are the only data that are well measured and standardized. The current challenge comes in aspect of Social pillar, measuring the guest and employee satisfaction in same way worldwide. The TBL helps the tourism industry to benefit from sustainability (Mousavi et al., 2017).

Conclusions

The research aimed to search possible using of existing evaluation of sustainability in hospitality area, where everyone would be happy by proposing hospitality sustainability index. Ability to sustain was firstly introduced as ecology, "the very expensive thing for hoteliers". Later it was defined as cost cutting, profit increasing technique. Big corporations, receiving the highest public pressure realize importance of all aspects of sustainability. Such corporations progress the most.

Novelty of the research brought model of calculation of the index measuring all 3Ps, helping to differentiate hospitality organizations. Hospitality sustainability index of competitive advantage was proposed to create further a competitive environment within the hospitality sector. Proposed HSI calculated with AHP method of entropy was compared with equal weights assigned model. All new HSI users need to understand that sustainability is generally accepted as component of 3P. They would probably judge differently and put different weight to a certain aspect of the model.

The results of the paper present contribution to the sustainable development of tourism from the view of preventive, environmental initiative, intended to minimize waste and maximize product output, as well as an increased contribution for all stakeholders, which is the goal of TBL approach as well. Although in this work we employ a hospitality organization model, the ideas can be extended to whole other types of organizations.

Abstract. This article aims to analyze the relationship between the threat of ransomware and new effective counteraction principles for law enforcement agencies to utilize. Moreover, it contemplates on how specific behavior of persons can help reduce the threat of being infected with this malicious software. It establishes that certain changes made in society's mentality towards their computer and network systems can significantly reduce the consequent damages of ransomware attacks. The manuscript uses a qualitative research approach and the analysis of variance (ANOVA), including an F-test, which defines major challenges in ransomware. This is the first empirical research piece which uses this type of data and approach for the analysis of current threats in global ransomware security. The article suggests that the main challenge is the systematic growth of ransomware connected to illegal businesses and the inattentive actions of casual users. The research paper proposes the implementation of global ransomware counteraction principles on the base of challenges that are present now and the prospects of rising threats in the future. In addition, the manuscript analyzes the trends of the last 2-years of attacks to find and determine new ways of successfully counteracting it for optimal innovative regional development.

Keywords: organizational performance; cybercrimes; innovation; regional development; information; security awareness; ransomware; law

1. Introduction

The post-industrial era makes global digital technologies accessible and easy-to-use. Today's society is reliant on the internet, although the effects of this dependence is a common topic of debate. Information Technologies (IT) provide many services that contribute to making our everyday lives simpler and more organized.

However, availability of global digital technologies opens opportunities for individuals who are looking to take advantage of their vulnerabilities. Security breakdowns can lead to economic losses of innocent citizens, companies and even governments. Worse still, perpetrators can use computers and network systems to raise alarms, create panic in anticipation of violent ransomware attacks–and to coordinate and carry out terrorist acts. To great despair, counteraction of cybercrime has faced many problems, which have yet to be resolved (Zimba et al., 2018; Plėta et al., 2020).

One of the most effective ways of bypassing security protocols of computer systems and consequently infecting them is through ransomware. Ransomware is one of many categories of malicious software and affects masses of computers: ranging from family desktop PCs to corporate systems. Ransomware is described as a "kind of malware which demands a payment in exchange for a stolen functionality". Unfortunately, these ransomware attacks are prominent to this day and pose a significant threat.

Researchers have attributed the lack of an acute response to these crybercrimes to many factors. Among them is IT professionals' lack of understanding and interest in the phenomenon of cybercrime. Moreover, law enforcement officials lack the tools necessary to address the problem: old laws cannot conform with committed crimes. At the same time, new laws have very few judicial precedents that can be guided (Mercaldo et al., 2016).

As will be further discussed in the study, virtually everyone has the potential to counter cybercrime, especially ransomware. And if everyone is well-informed, attentive and careful, society in its entirety will have a better understanding of the principles of preventing these ransomware attacks. Of course, lots of changes will have to be made to achieve this (Kurpjuhn, 2019). But two groups specifically can increase their efforts to handle this problem and pave the way for countering this phenomenon (Chung, 2019; Al-rimy et al., 2018).

Another problem that should be emphasized is that everyone is talking about cybercrime despite not having an official definition of it (O'Kane et al., 2018).

2. Literature review

As cyberspace becomes more prominent in the modern world, it is evident that law enforcement agencies are not always able to keep up with its rates of growth. The scale at which IT has consumed the world has made systematicly and successfully committing cybercrimes possible. Because of this, networks of cyberfraud begin to nest in virtual space and harm individuals, governments, businesses. Responses to these actions should be strategical, tactical, and cooperative (Fagioli, 2019).

Cybercrime counteraction faces many problems. The general confusion surrounding the definition of cybercrime is an issue that needs to be addressed and resolved. A lack of professionals correctly determining the unique nature and threats of cybercrime could result in an array of complications which make counteracting it even harder.

There are many reasons justifying the development of a model definition of cybercrime specifically. A standardized perception of cybercrime across IT personnel, computer users, victims, police officers, detectives, prosecutors and judges will lead to the aforementioned unification of different social institutions, which, above all

else, is arguably the most important aspect of dealing with this lawlessness. Furthermore, the problem of insufficient and unreliable statistics could begin to be resolved if different participating branches use a single classification of cybercrime (Furnell and Emm, 2017; Genc et al., 2018).

Cybercrime definition should be unified not only among agencies, but among countries as well, due to the possibilities that cyberspace, the virtual space in which cybercrimes are committed, grants. This virtual world allows crimes to happen wherever. Thus, a mutual understanding of cybercrime across the globe is necessary to counteract this aspect of the problem (Kolodenker et al., 2017; Alwaelya et al., 2020; Yumashev and Mikhaylov, 2020; Yumashev et al., 2020).

Cybercrime definition would aid not only cooperation between agencies but also all parties individually. For example, IT professionals need a good definition of cybercrime to know when (and what) to report to authorities. At the same time, law enforcement needs a legislative definition of this type of crime to prosecute offenders, as laws must be defined in order to be enforceable (Pope, 2016).

Attempts to define cybercrime illustrate that it is a very generalized term. Practically speaking, these definitions are useless in almost any discussion, especially that which attempts to fully analyze cybercrime. This research paper now presents some noteworthy interpretations of cybercrime (Paquet-Clouston et al., 2019).

Many state-level and international organizations have attempted to give a working definition. The Council of Europe's Cybercrime Treaty's definition of cybercrime is broad, including such offences as criminal activity aimed at collecting or manipulating data and even copyright infringement. The United Nations Manual on the Prevention and Control of Computer Related Crime on the other hand, includes more misdemeanors, such as forgery, unauthorized access to computer systems and fraud. Symantec Corporation, which is a company specializing in computer security, gives the following definition of cybercrime: "any crime that is committed using a computer or network, or hardware device". At this point in the 21st century though, almost any action of any person in a First-world country utilizes the listed elements, so, perhaps, the line between a regular crime and cybercrime becomes too blurry.

Other studies and research papers are categorizing cybercrimes in order to come to a more cohesive conclusion. Gordon and Ford (2006) brought the idea of distinguishing Type I and Type II cybercrime based on the offences' characteristics, including whether or not the act was limited to computer systems exclusively (Covic and Voß, 2019; Mikhaylov and Tarakanov, 2020, Mikhaylov and Sokolinskaya, 2019).

Conversations and discussions on cybercrime in general can be extensive. However, this study focuses on one of the most common offences in cyberspace: ransomware. Ransomware, as has been already stated, is a type of malicicious software (Malware) which infects many Personal Computers. The infection, generally, can be in two forms. The first one completely locks out the user from accessing their system unless a ransom is paid. The other form restricts access to sensitive documents and information under the threat of deleting them unless the same condition is met. The size of the ransom can vary depending on the victim and situation, and criminals often demand the fee be payed in Bitcoin due to the privacy and lack of transparency that comes with cryptocurrency payements and transfers. Regardless, the general consensus is to not pay the ransom, as in doing so, the victim is proving the hackers' scheme to be profitable and they will continue to harm other systems. Moreover, no victim can be sure that the criminals will "hold up their end of the bargain" and actually unlock the system and/or files (Gonzales and Hayaineh, 2017; Zhang et al., 2019; Meynkhard, 2019; Lopatin, 2019; Lopatin, 2020; Denisova et al., 2019; Mikhaylov, 2018a; Mikhaylov, 2018b).

Although CryptoWall, which had become the leading version of ransomware in 2015, had great reputation for decrypting files after paying the fee, far from many other criminals and systems were as honest, which, of course,

is unsurprising. Because of this and many other reasons, involving the threat of more frequent ransomware attacks in the long term, the demanded sum of money had never been paid in over 3% of known cases (Richardson and North, 2017; Szlosarek et al., 2019; Covic and Voss, 2019; Dorantes-Argandar et al., 2019; Iliopoulou et al., 2019; Huang et al., 2019; Hadiuzzaman et al., 2019; Jasti et al., 2019).

Ransomware has been terrorizing persons' computer systems for over a decade now. The volume of these infections when the first ransomware ransomware attacks were made was initially low. Nevertheless, the rate at which ransomware spread increased over 500% in the year 2013 when compared to previous years. One of the many reasons that the number of ransomware attacks had increased exponentially was due to the fact that ransomware has shifted from infecting business network systems and computers to personal computers in households. It is noteworthy that these ransomware attacks are also more frightening, which is explained by the nature of household users to neglect backing up their files and using an effective antivirus that may prevent such happening in the first place (Connolly and Wall, 2019; Meynkhard, 2020b; Nyangarika et al., 2018; Nyangarika et al., 2019a, Meynkhard, 2020a; Nyangarika et al., 2019b).

Malware itself is accompanied by other viruses and worms, which harm computer systems and are a breach of security and privacy. One of the key issues relating to this subject is that programs meant to decrease victimization risk are not very effective. As of 2020, it is estimated that 33.28% of unprotected computer systems are infected with malware. Compare this to the 25% of PCs that are infected despite having anti-virus programs installed, and it would seem, as indicated by the relatively small spread between the figures, that these applications alone cannot prevent infections from happening. Moreover, criminology and IT are not capable of single-handedly counteracting this problem. It is an individual's responsibility to be familiar with the consequences of browsing suspicious and unsafe websites and change their behavior accordingly (An and Dorofeev, 2019; Brewer, 2016; Varyash et al., 2020; Moiseev et al., 2020; Nie et al., 2020).

Taking these facts into consideration, self-control is an important factor when analyzing victimization rates. It is a user's responsibility to be wary of visited websites and downloaded files. Low levels of self-control contribute to certain types of security breaches, data manipulation, and on-line harassment. Not only that, but these individual characteristics can be associated with minor cyberdeviance. These discoveries illustrate that individual characteristics and decisions are vital for safety in cyberspace but are not able to sufficiently provide a full line of security (Everett, 2016; Mohurle and Patil, 2017; Mikhaylov, 2019; Dayong et al., 2020; Denisova et al., 2019; Dooyum et al., 2020).

Among many cyberspace attacks, ransomware in particular is dependant and reliant on the behavior of the infected user – the victim. Ransomware attacks can be coordinated, targeting a specific system, e.g. a company's network of computers. However, these offences often happen due to a lack of attention from potential users – they "accidentally" get infected whilst visiting suspicious websites and downloading unsafe files. The behaviour of a user is presented not only by whether or not he has been infected, but also by his decision to pay the ransom or not. This is a key component in understanding and preventing ransomware attacks, because the decision to comply with hackers can give them incentive to keep their criminal spree going (Bhardwaj et al., 2016; Aurangzeb et al., 2017). This problem for IT-infrastucture of transport sector is researched (Chiabaut and Barcet, 2019; Nguyen et al., 2019; Bešinović and Goverde, 2019; Enayatollahi et al., 2019; Mohri and Akbarzadeh, 2019; Sun and Apland, 2019; Jevinger and Persson, 2019; Czioska et al., 2019; Heyken Soares et al., 2019; Habib and Hasnine, 2019; Malucelli and Tresoldi, 2019; Downward et al., 2019; Candelieri et al., 2019).

3. Materials and methods

A qualitative research approach is used in this study to reach its goals. Qualitative inquiries can be used for deep studying of ransomware crime like researchers before (Connolly and Wall, 2019). A focus group was created in order to be examined and analyzed. Our sample is made by persons who had rich experience with crypto-ransomware ransomware attacks.

Several measures were taken to verify the study's results and ensure reliability of the findings. Secondary data served as an important validator of discoveries. Moreover, the employment of a purposeful sampling technique prevented sampling distortion. The sample size itself was determined by the principle of theoretical saturation, equating to 30 interviewees.

Another key technique used in the study was asking respondents to provide feedback on interview transcripts and study findings and subsequently rationalizing them. The results of the survey were shared with an experienced researcher from TrendMicro, who provided important expert comments. All findings are supported by interviewees' quotes, providing additional verification. Finally, study informants showcased a high degree of unanimity about the necessary organizational measures needed to respond to the crypto-ransomware threat suggests that the results are reliable and will not change significantly if additional organizations were to be interviewed.

It is our belief that these precautions have eliminated most inaccuracies and misunderstandings from the data collection. Although we do not claim that the list of proposed measures is exhaustive, the utilization of the aforementioned principles ensures reliable results. As for the validity of findings, the situation is generally more complex. Interviews inevitably allow participants to answer questions in ways that distort facts. However, in this study, the situation appears to be unique. Participants had various incentives to provide factual answers. Although we do not claim that the study participants were entirely honest or forthcoming, several factors allow us to conclude that interviewees provided trust- worthy replies (Mikhaylov, 2020a; Mikhaylov, 2020b; Mikhaylov et al., 2020).

This conclusion can be made based on several reasonings. The majority of victims suffered greatly from crypto-ransomware attacks, including personal emotional distress as well as physical damage to IT infrastructure. The key incentive for participation in this study was to share their experiences with the aim to prevent future ransomware attacks on other organizations. Interviewees appeared to be genuinely concerned with the threat that these attacks present, including its recent proliferation and the consequences it may entail. Several respondents strongly disapproved the fact that many organizations are hiding active cyber-ransomware attacks. Moreover, several interviewees were appalled by the fact that criminals held them hostages and wanted to 'share their story' and warn others (Mikhaylov et al., 2019; Mikhaylov et al., 2018).

Almost all victims actively participated in validation exercises and expressed a keen interest in receiving final results and conclusions. As for Police Officers from the CCUs, the very nature of their job is to reduce cybercrime. Hence, they have a genuine interest in providing objective data. Our observation was that law enforcement representatives readily shared data on ransomware ransomware attacks, carefully concealing victims' identities. Other tactics that may have ensured honesty in informants included clearly communicated anonymity procedures, an option to change or delete parts of text in the transcripts (Sunchalin et al, 2019; Gura et al., 2020; Mikhaylov et al., 2020; Prosekov et al., 2020).

With respect to the respondents' confidentiality, aliases are used for the informants and ransom amounts are concealed, as the latter could otherwise be used to identify some of the interviewees (Table 1).

Table 1. Ransomware types and targets.

Source: authors

The data was used between January and December 2018. The interview questions are as follows:

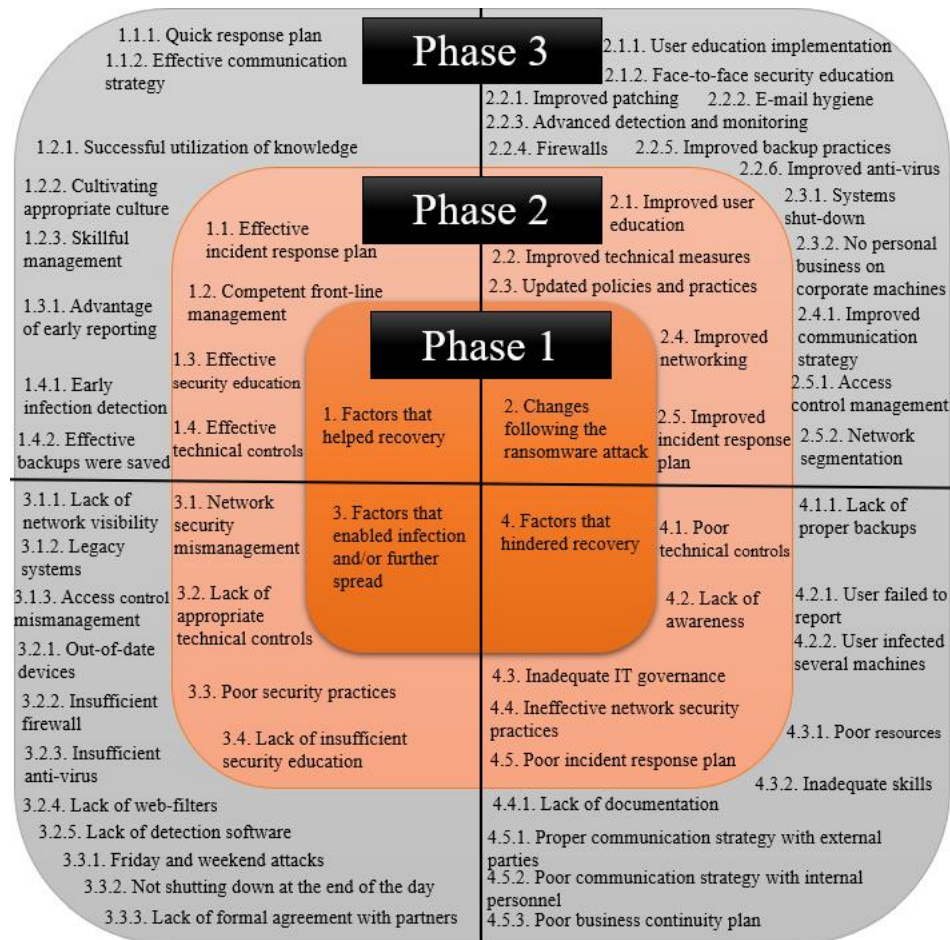
Can you please describe the experience of the ransomware incident?
What made you understand that a ransomware ransomware attack took place?
What was the source of the ransomware?
In your opinion, why was the ransomware effective in infecting the network?
Does your organization have ransomware policies and provide specific training?
Does your organization backup its files and electronic documents?
Does your organization utilize antivirus software?
Does your organization have cybersecurity insurance that overs ransomware?
What did you learn from this experience?
What changes have been made in the organization following the ransomware attack?


Fig. 1. The phases of analysis
Source: authors

The research targeted the speacilists' reaction during the cybercrime incidents and has 3 phases of analysis (Fig. 1). The paper classifies answers and obtained results of the ransomware attacks. The ransomware attack time horizon is from the years of 2014 until 2018. These ransomware attacks were structured by the types of crypto-ransomware. The aim is to find a balance between using specific humans or machine systems as initial targets. (Ivanyuk and Soloviev, 2019; Ivanyuk, 2018; Radosteva et al., 2018; Elizarov et al., 2017).

Furthermore, statistics on e-mail spam and phishing rates (Appendix) are used to confirm the thesis that they are both correlated in infecting computer systems with ransomware. It is noteworthy that the analysis of variance (ANOVA) in particular is used in order to find possible discrepencies and differences between the cases. The tables are used as samples and the discovery of variance. Whilst related methods, such as the *t-test are* similar, and can also be used, the decision to use the ANOVA specifically was made due to familiarity of the authors with it (An et al., 2019a; An et al., 2019b; An et al., 2019c; An et al., 2020a; An et al., 2020b; An et al., 2020c).

4. Results

As we have already reviewed, the behavior of people is incredibly important in situations regarding the prevention of infections in cyberspace and the successful reolvement of problems which may arise. The interview that was conducted is meant to understand what methods organizations utilize to keep their data and systems safe.

The collected data shows that over half of victims are able to retrieve lost data using backups. This method, as described by the interviewees themselves, allowed them to avoid some damage caused by the attack, whilst simultaneously not succumbing to the criminals' demands. This has proven to be incredibly effective.

An aspect that had been vital to understanding the scale and consequences of ransomware infections is insurance. Figure 1 presents data on countries with cybersecurity insurance and contrasting insurance which covers ransomware attacks in 2019. This data directly parallels with the study's first stage of analysis titled "Factors that helped recovery" and the subsequent stages.
Fig. 2. Cybersecurity insurance by country in 2019.
Source: Sophos

As evident by the Figure, the choice of obtaining insurance that covers ransomware is inconsistent among the examined countries. Some countries decide to "go the extra mile" and also protect themselves from Ransomware. In order to understand the reason behind some countries' organizations valuing ransomware insurance more than others, the study observes the states in which ransomware attacks are more frequent (Figure 3).
Fig. 3. Percentage of organizations hit by ransomware in 2019.
Source: Sophos

As you can see, India has been targetted most often, which explains the neccessity to buy not only cybersecurity insurance, but also that which protects from ransomware. Of curse, this may lead to subsequent problems, which is based on the ransom being paid (Figure 4).
Fig. 4. Percentage of organizations that paid the ransomware in 2019.
Source: Sophos

It is not surprising that the country with the most intense insurance-policy pays the ransom far more often than many other states. This method of dealing with ransomware, as stated by our interviewees, proves to be effective, as almost every organization that was attacked by ransomware and paid the fee had the ransom paid by insurance. Subsequently, this often resulted in data and systems being unlocked.

The sums of money paid should also be put in perspective. The figure 5 below shows the average fee among ransomware infections contrasted with one of the most expensive types of ransomware – Ryuk. The key takeaway from this graph is that this volume of money ends up in the hands of criminals, that may use these new resources to continue harming other computer systems.
Fig. 5. Ransomware fee. Ryuk average fee and Ransomware average fee (USD$).
Source: Sophos

Regarding the ANOVA test, a strong correlation (F=10019) was found between email spam rate and email phishing rate (Table 2). These methods are both common, and thus users should be informed about the possible dangers of both methods in which hackers can take advantage of vulnerebilities in their systems. These results also parallel with the results of our interview, where most infections were said to happen through e-mail messengers.

5. Discussion

Commercial companies have given employees short seminars about these problems. There are programs for theoretical studies and practical experiences of law enforcement in big cities (Malecki, 2019; Yaqoob et al., 2017).

In rural areas and provinces, only a few law enforcements officers have specialized training in computer crime investigation. But this situation is slowly improving. Crime scene patrol officers are some of the most trained individuals in this area of expertise. They are first to produce and store (or destroy and approve the destruction of) valuable digital evidence. Ideally, all members of the justice system should receive basic information technology education and, better yet, the level of training that these officers have. However, this goal cannot be achieved in a short time period, but requires revamping the system of guides that are followed by officials (Mansfield-Devine, 2016).

As for the results of scientific methods used: businesses in particular are interested in ensuring the security of their data, documents and files, as the damages can be overwhelming. This has led to the development of different plans meant to resolve possible issues. Among them, as we have noted, is insurance along side file backup. Insurance is a form of "temporary solution", as the criminals are still able to gain their desired resources. Backups on the other hand, do not resolve the issue of "bricked" hardware, as it allows to replace previous systems with newer. However, this has the potential to save a business large funds compared to insurance or plainly paying the ransom. Moreover, insurance-paid ransom is not guaranteed to be unlocked – backups are more reliable in this situation.

This brings us to arguably the most important point of the study – preventing ransomware attacks from happening in the first place. This is obviously the most beneficial situation, but it requires training and increased attention from users – a change in their behavior in cyberspace in general.

Users are capable to prevent thousands of dollars in damages if they simply add discipline, control, awareness to their browsing and Internet-surfing experience. This is the exact reason many organizations that have faced ransomware attacks intensify their programs to educate employees – as they, individuals, are also responsible for vulnerability exploitation (Ye et al., 2016).

6. Conclusion

Nowadays, very few organizations, governments and persons work and function without the use of gadgets, IT devices, computer systems. Because technology has integrated in to our lives as much as it has, it becomes progressively more important to invest in making cyberspace safe.

The study has reviewed how different methods of resolving the attack impacts the spread of ransomware across the Internet – be it insurance policy, backups or simply paying the ransom. Furthermore, the possible gateways to infection have been analyzed and examined. A strong connection between e-mail spam and phishing has been found, which reinforces these two methods of infection as one of the most common – making them essential to be learned in group seminars and courses about safety in cyberspace.

The research paper has also drawn results from interviewing persons with first-hand experience of facing ransomware attacks. These attacks emphasize vulnerabilities in the organization's computer system and can lead to permanent damage and file-loss. In the aftermath of the attack, organizations' and persons' weak spots are put on display, and they begin to take cybersecurity in a more serious manner, as it is an urgent manner – no one can know if they will be attacked today, tomorrow or in a month.

Despite paying much attention to ways that ransomware can be dealth with, this study values prevention tactics the most: making sure that infections do not occur in the first place. There are

This study, just as any other, has its limitations. For example, there are other common ways users can get infected with unwanted virii, such as visiting suspicious websites and downloading hazardous files and documents. these methods were reviewed, but were not researched in further detail. Furthermore, mobile users have been facing the issues of ransomware infections at an increasing alarming rate. This type of virus has become more common on gadgets and this should be a topic for future extensive research. There are numerous studies discussing machine learning methods of detecting ransomware, which is a topic that can be successfully utilizied by big corporations as well as governments.

7. Contribution to the body of knowledge

This paper summarizes the literature review on the growing problem of ransomware attacks across the world. The principals of infection have also been discussed and analyzed. Furthermore, the article emphasizes the causes and sources of users' vulnerability. It has evaluated that the industry of Information Technology has potential to become safer not only through means of regulation, but also by changing the mentality that people have when browsing the internet. The research paper has reported on actions to prevent the spread of ransomware can and should be done by all social institutions: governments, organizations and households. Governments have numerous levers to not only detect attacks and resolve issues, but bring criminals to justice. The state has a monopoly on this, as no other institution, be it a business or individual person, can "get revenge" for the damages. In order to do this, laws must be passed to build a legislative base for counteracting cybercrime and punishments

for misdemeanors. Furthermore, governments have the opportunity to cooperate on and international level to ensure a level playing field all over the globe.

Appendix

Answer classification of analysis' phases.

1.1.1.1 we responded methodically	3.1.3.7 scanning vulnerable IPs on Internet is simple
1.1.1.2 processes were documented in the incident response plan	3.1.3.8 vulnerable Internet facing servers
	3.1.3.2 we voluntary enabled RDP
1.1.2.1 we handled media invasion very well	3.1.3.3 RDP brute-force due to weak password
1.1.2.2 we were able to inform staff immediately	3.1.3.4 RDP system is not brilliant
1.2.1.1 breach coach helped enormously with recovery	3.1.3.5 Microsoft ignored our RDP concerns
1.2.1.2 cyber insurance provided information we needed	3.1.4.1 escalated privileges
1.2.1.3 cyber insurance reimbursed many expenses	3.1.4.2 poor management of admin passwords

1.2.1.4 security vendor was helpful
1.2.1.5 cyber experts are needed to find patient zero
1.2.1.6 IT contractors worked very hard
1.2.1.7 IT contractor decrypted scrambled data
1.2.1.8 internal staff is the key to successful recovery
1.2.2.1 timely reporting led to fast reaction to the threat
1.2.2.2 it is important to let people know what is happening
1.2.2.3 people were compassionate and determined
1.2.2.4 despite of challenging conditions, people were amazing
1.2.3.1 security-savvy IT manager
1.2.3.2 knowing what to expect helps
1.2.3.3 prior experience with ransomware attacks helps
1.3.1.1 early reporting gave us advantage of time
1.4.1.1 we had sophisticate detection software
1.4.1.2 anti-virus was up-to-date
1.4.2.1 we frequently test backups
1.4.2.2 our offline backups saved us
2.2.1.1 centrally-managed vulnerability management
2.2.1.2 scheduled vulnerability management
2.2.1.3 removing Flash
2.2.1.4 business applications update
2.2.2.1 blocking certain attachments and links
2.2.2.2 email identification
2.2.2.3 malicious code analysis platform
2.2.3.1 centrally-controlled upgrades
2.2.3.2 upgrading legacy systems
2.2.3.3 OS upgrade
2.2.4.1 implementation of detection system
2.2.4.2 monitoring software
2.2.5.1 advanced protection firewall
2.2.5.2 securely-configured firewall
2.2.6.1 testing backups
2.2.6.2 offline backups
2.2.7.1 higher protection anti-virus
2.4.1.1 considering loss of IT
2.4.1.2 informing staff via text messages
2.5.1.1 applications roles and responsibilities
2.5.1.2 least privileges approach
2.5.2.1 retiring old machines
2.5.5.1 disabling RDP
2.5.5.2 robust VPN to replace RDP
3.1.1.1 we do not know who connects to network
3.1.1.2 we do not know amount of ransom notes received
3.1.1.3 no control over upgrading/updating OS
3.1.1.4 it was like a fog when we got infected
3.1.2.1 legacy systems could not be upgraded
3.1.2.2 legacy systems could not be retired
3.1.3.1 we do not know who connects via RDP
3.1.3.6 RDP enabled by default

3.1.4.3 infected domain controller
3.1.4.4 disregard for proper network structures
3.1.4.5 root access
3.2.1.1 ransomware came in via vulnerable server
3.2.1.2 some of our servers were very old
3.2.1.3 out-of-date software
3.2.1.4 SMB vulnerability
3.2.1.5 out-of-date Flash
3.2.2.1 low-level protection firewall
3.2.3.1 new malware signature
3.2.3.2 out-of-date anti-virus
3.2.3.3 drive-by-download
3.2.4.1 infection came through browsing Internet
3.2.5.1 ransomware stayed undetectable for days
3.3.5.1 signs 'please do not turn computer on'
3.3.5.2 Friday ransomware attacks
3.4.1.1 aging employee
3.4.1.2 apathy
3.4.1.3 you are as vulnerable as your least savvy user
3.4.1.4 convincing email
3.4.1.5 well-crafted email
3.4.1.6 it starts with user
4.1.1.1 a lot of critical systems did not have backups
4.1.1.2 Time Machine was encrypted
4.1.1.3 backups got deleted by ransomware
4.1.1.4 backups were not particularly clever
4.1.1.5 insufficient backups forced us to pay
4.1.1.6 servers were not affected, only desktops and laptops
4..1.1.7 backup software was only grabbing chunks of files
4.1.1.8 sensitive information was encrypted
4.1.1.9 too many nodes got encrypted
4.1.1.10 IT provider failed to ensure efficient backups
4.1.1.11 networked backups
4.3.1.1 lack of proper funding
4.3.1.2 IT team is absolutely tiny
4.3.1.3 too many servers for such small IT team
4.3.2.1 inappropriate background leading to poor governance
4.3.2.2 senior management incompetence led to further infections
4.3.2.3 not understanding the importance of IT
4.3.2.4 senior management should have been more involved
4.3.2.5 underappreciation of IT
4.5.1.1 phone calls from other organisation caused disruption
4.5.1.2 media invasion
4.5.1.3 security vendors invasion
4.5.2.1 we did not realise email will be down
4.5.2.2 we did not have mobile phones of senior management
4.5.2.3 no one thought of IT resources being unavailable
4.5.3.1 we did not know how to do both investigation and recovery

AFTER COVID-19. REORIENTATION OF CRISIS MANAGEMENT IN CRISIS[*]

Zbyslaw Dobrowolski

Jagiellonian University, Institute of Public Affairs, ul. Prof. S. Lojasiewicza 4, 30-348 Krakow, Poland

E-mails: zbyslaw.dobrowolski@uj.edu.pl

Abstract. The occurrence of the COVID-19 Pandemic has revealed all the weaknesses of different organisations, including macrostructures – the States. It turned out that they are unprepared to COVID-19 Pandemic and at the same time pretending that they are controlling unpredictability, which is not valid. I collect information through a review of secondary data and observation of pandemic effects in several countries. In all countries, the effects of a pandemic are noticeable. It creates the slowdown of the economy and the introduction of restrictions on public life on an unprecedented scale. The effects of current economic restrictions will appear in a few months. I identified weaknesses in the crisis response and argue that any organisations also in macro-level should redefine the role of crisis management, which is in crisis. There is a need for a co-evolving this system within the organisation, which means the necessity of reshaping crisis management from crisis management relational model into crisis management three-dimensional flexible model. Crisis management based on risk analysis may be useless in the context of organisational unpredictability.

Keywords: Pandemic; unpredictability; crisis management; forecasting; foresight

1. Introduction

COVID-19 pandemic revealed weakness in organisations and macrostructures in different scale in all of the World. It is sufficient evidence that crisis management has failed. The effects of unpredictable pandemic are significant. They are breaking supply chains, hindering business operations, results in loss of trust and reputation. Most countries have severe problems with ensuring essential health and economic security for their citizens and residents.

There are many studies on crisis management (c.f., Mansfeld, 1999; Okike, 2004; Ghosh, Ostry, & Qureshi, 2015; Besenyő, & Kármán, 2020). However, there is little know why crisis management is flawed, which is proved by systematically recurring crises and the last one initiated by COVID-19. I aim to fill this research gap and formulate the following research problem, whether crisis management relational approach based on risk management is appropriate in conditions of unpredictability?

The paper proceeds as follows: First, I review previous research on crisis management, and formulate methodology. Next, I build a new model of crisis management. After that, I formulate conclusions and identify an area of future research.

2. Theoretical Framework

2.1. Nature of crisis and crisis response

Literature study showed that the nature of the crisis and its responses are multifaceted. Following Smith view, there is no collective acceptance about the precise meaning of the term "crisis" (Smith, 2005, p. 319). However, Jaques (2010) noticed that a descriptive definition developed by Pearson and Clair (1998) is appropriate: "An organisational crisis is a high impact event that threatens the viability of the organisation and is characterised by ambiguity of cause, effect and means of resolution, as well as by a belief that decisions must be made swiftly" (p. 60). This definition should be changed. An organisational crisis is indeed a high impact event that threatens the viability of the organisation. However, causes of the crisis can be known or should be determined, but they have not been established because the organisation has neglected potential threats. Therefore, an organisational crisis is a high impact event that threatens the viability of the organisation and is caused by neglect observation of potential threats, their effects and means of resolution.

Müller (1985) noticed that in a crisis, it is highly unlikely that problems will be solved at a single stroke or by ad-hoc action. It leads to the assumption that despite the urgency of the crisis, the situation demands management and solving-problems from a three-dimensional perspective, which includes organisational, managerial and political issues. One may add to this perspective, another one, an axiological dimension. Moral weaknesses in organisations may catalyse a crisis, but also cause such ethical crises (Boling, 1978; Dobrowolski, 2017). Paraskevas (2006) using narrative analysis identified weaknesses in the chain's crisis response. Kouzmin (2008) noticed, that crisis management can be unable to decrease escalating crisis in increasingly risk-dominated economies. His statement needs to be fulfilled.

Crisis management proved to be useless in a pandemic. Johansen, Aggerholm and Frandsen (2012) presented and discussed some of the main findings from a broad survey of internal crisis management and crisis communication conducted in 2011 among the 367 largest Danish private companies and 98 public organisations (municipalities). The study showed that the vast majority of analysed organisations had a crisis or contingency plans. However, the questions: how do they implement these plans, and what are the effects of the crisis management were without answers. Surely, such a response is possible in the crisis, which means ex-post. I argue that it is too late to obtain such a solution. There is a need to verify the accuracy od such plans and effectiveness of problem-solving ex-ante. Therefore, organisations should not only prepare crisis or contingency plan but also measures of verification these plans. Preble (1997) notes the fields of strategic management and crisis management have been evolving separately despite their potential for synergistic integration. This author shows how the combination of crisis management's approach to strategic management's offensive market positioning orientation can strengthen the strategic management of organisations.

Richardson (1995) examines the nature of crisis-prone organisational beliefs and behaviours and focuses mainly on disaster - proneness. Richardson shows that narrow views of reality and the organisational systems and

behaviours promoted by such views lead to crisis events. He concludes that many of us work in organisations which are "crises waiting to happen". Such observations lead to a generalisation that the management and employees of the organisation catalyse crises with their inertia.

The practical conclusion that comes from these studies, although not presented by Richardson, is that mechanisms should be developed for warning against the limited perception of the environment and threats by members of the organisation. It leads to the generalisation that crisis management based on risk analysis may be useless in the context of organisational unpredictability.

The importance of risk assessment presents many researchers (Simunic & Stein, 1990; Friedlob & Schleifer, 1999; Reamer, 2000; Chang et al., 2008; Phillips, 2011; Wang & Li, 2011; Christensen, Glover, & Wood, 2013; Amir, Kallunki & Nilsson, 2014; Gramling & Schneider, 2018). Uncertainty differs from risk (Dobrowolski, 2020). One may measure and quantify the risk, and the potential outcomes are known—uncertainty links with unpredictable future events. One may mitigate the risk. Uncertainty is beyond the control of the individual, group or organisation (Cook, 1988; Alaszewski & Coxon, 2008; Samson, Reneke & Wiecek, 2009; Renn, Klinke & van Asselt, 2011; Dobrowolski, 2020).

The most crucial challenge for organisations operating in conditions of uncertainty is the ability to respond to unpredictable situations actively (Dobrowolski, 2020). Organisations which want to exist in an unpredictable environment need solid roots based on social capital, where trust plays a key role (c.f. Coleman, 1990; Prusak & Cohen, 2001; Adler & Seok-Woo, 2002; Hansen, 2002; Dobrowolski, 2020). Such organisations have to use foresight, which may help tame many unknowns of uncertainty through the selection of one of the different future options and creation conclusion for the present, and decision for one of the options (c.f., Ansoff, 1980; Martin, 1995; Barker & Smith, 1995; Miles, 2008; Cuhls, 2008; Liebl & Schwarz, 2010; Cuhls, 2003; Georghiou et al., 2008; Greenblott, O'Farrell, & Olson, 2018; Cuhls, 2019; Dobrowolski, 2020; Gordon & Helmer, 1964; Bright & Schoeman,1973; Martino, 1983; Andriopoulos & Gotsi, 2006; Popper, 2008, 2008a).

Foresight includes identification of weak signals and wild cards. Weak signals are early, often inaccurate, signs of impending events. These events, after the occurrence, affect individuals, groups and organisations and their environment in the very indefinite future (Botterhuis et al., 2010; Dobrowolski, 2020). Weak signals are precursor events, or they are early warnings, namely slight changes in the current state of affairs or existing trends that−if observed and correctly interpreted−may hint at a growing likelihood of occurrence of a specific Wild Card. These signals may be unclear at the beginning, but they may become more precise in time (if monitored) or more reliable, perhaps in combination with other signals (Botterhuis et al., 2010; Brynielsson, 2013; Dobrowolski, 2020). Wild Cards are potential future events with a low likelihood of occurrence but with high impact in the future, if they occur (Mendonca et al., 2004; Smith & Dubois, 2010; Hauptman, Hoppe & Raban, 2015; Qi & Tapio, 2018; Dobrowolski, 2020). Researchers (c.f., Mendonca et al., 2004) advocate the implementation of a weak signal methodology and identification of wild cards by scanning the decision environment. They suggest the nurture of improvisation capabilities, which help exist in an unpredictable environment. This approach may lead to organisational agility (Ilmola & Kuusi, 2006; Dobrowolski, 2020).

The appearance of past cases of transmission of animal diseases to humans and the fact of functioning in the conditions of globalisation should be a sufficient signal to take remedial actions to prepare for a new pandemic properly. It was, therefore, necessary to introduce mechanisms for the selection of potentially sick patients at all border crossing points, in particular airports. It was necessary to determine the capacity of hospitals and their equipment with life-saving measures. There is a need to redefine economic policy. Current policy is flawed due to based on greed manifested in need to achieve ever-higher profits and satisfaction of shareholders and leading to the relocation of production to countries with lower production costs. This short-sighted policy led to the emergence of monopolistic practices and total dependence on supplies in one or two countries. The effects of

breaking the supply chain were noticeable. It was a crucial weak signal of upcoming economic disaster, and it is unbelievable that such visible signals have been ignored. It is, therefore, necessary to end this policy and rebuild "strategic" production in individual countries. One must move away from the naive assumption that business is transnational. Business is and will be national because it is too dependent on politicians.

2. Methodology

The observation of the scale of COVID-19 problems in the following countries: the USA, Spain, Italy, the United Kingdom and France leads to the following generalisation. Crisis management in those countries is in crisis. Next, I started to literature review to establish whether crisis management relational approach based on risk management is appropriate in conditions of unpredictability? I aware that literature study as the primary research method can be perceived as the limitations of this research. However, I argue that literature research is valuable, though secondary, source of evidence. In management sciences, theories are build based on practice. The lack of any reference in the literature about foresight in crisis management may confirm that such a solution was not taken into account. Consistent with an abductive approach (Lukka, 2014; Lukka & Modell, 2010), the insights in this paper have emerged iteratively through consideration of both theory and the empirical cases.

3. Results
3.1. Approach of crisis management

Jaques (2007) showed that linear life-cycle models of crisis management are flawed and did not fail to capture the full dynamics of changes. Therefore, there is a need to use a non-linear, relational construct which considers issue and crisis management in the context of interdependent activities, which must be managed at different stages. He aptly notes that such an approach includes the role of issue-solving management in both the pre-crisis and post-crisis phases.

The traditional approach, called "event approach" regards a crisis as an adverse event. It focuses on incident response – what an organisation has to do when a crisis occurs and how to prepare for it in case it happens (Jaques, 2010). However, this concept is based on the assumption that "a crisis is a sudden and unexpected event that threatens to disrupt an organisation's operations and poses both a financial and reputations threat" (Coombs, 2007, p. 164) or "a crisis is an unplanned (but not necessarily unexpected) event that calls for real-time high-level strategic decisions in circumstances where making the wrong decisions, or not responding quickly or proactively enough, could seriously harm the organisation" (Davies, 2005, p. 69). Meanwhile, the crisis occurs because the organisation is flawed, which means that there were no preventive measures to predict crisis occurrence.

Recently a distinct tendency for crisis management evolves beyond the operationalised response. It flows from the argument of a growing awareness that organisations should focus on identifying any signs of crisis to avoid it. It has led to increasing acceptance of crisis management as part of a process continuum. What does it mean? It means that organisations need to take into account that: a) most crises are not sudden events; b) that leaders and managers have to be familiar with red flags of crisis and ensure that such red flags are consistently developed. Familiarity with red flags may prevent potential crises, or to mitigate those which do occur. Pauchant and Mitroff aptly note that "Crisis management is not the same as crash management – what to do when everything falls apart" (Pauchant & Mitroff, 1992, p. 11). It means that they pointed out the proactive approach to the crisis. Shrivastava (1995) noticed that crises are not events but processes (Jaques, 2010).

Crises are not discrete events, but mostly high-intensity nodes in ongoing streams of social interaction ('t Hart, Heyse & Boin, 2000, p. 185). It means that crisis is an ongoing process, which after disclosure and application of remedies mutates and occurs in a different form. It, therefore, requires constant tracking of early signals, named weak signals, or symptoms or "red flags" of crises. Such approach is complementarity between the event approach

and the process approach to crisis management, and I do not compare these the approaches in detail knowing that it was analysed in the past (c.f., Forgues & Roux-Dufort, 1998; Jaques 2009; Roux-Dufort, 2007, Jaques, 2010). Following Jaques study I also identify the challenge in the present study is how to represent the new crisis process approach in a way which translates into structural design, utilising the continuum of established management terminology and activity. I also agree with Roux-Dufort (2007) and Jaques (2010) that in the situation of different organisational needs, there is no best practice model for how to resolve the crisis. Many organisations may reflect a combination of both the event and the process approach to crisis management.

Jaques proposes to take into account the process continuum approach instead of the event approach, which means the implementation of more fully integrated, a non-linear model which establishes crisis management as a cyclical construct (Jaques, 2007). In his model one may recognise four cores: crisis preparedness; crisis prevention; crisis even management and post-crisis management, which includes the last and simultaneously first stage: evaluation and modification of activities.

Crisis preparedness includes planning processes, systems manuals, training and simulations. Crisis prevention includes early warning scanning, issue and risk management and emergency response. Crisis event management includes crisis recognition, system activation/response and crisis management. Post-crisis management includes recovery, business resumption, post-crisis issue impact, evaluation and modification (Jaques, 2007, 2010).

Analysis of this model leads to the identification of some organisational problems. There is unclear why Jaques distinguishes crisis preparedness as a separate core and does not link this core with crisis prevention. According to (the very well-recognised in management sciences) Adamiecki and Chatelier the cycle of organised activity, the analysis should precede planning. It means that planning processes should be effects of weak signals, but simultaneously weak signals scanning should proceed as planned. There is, therefore, a need for link early weak signals with planning instead of distinguishing between two cores, including separately planning and scanning signals.

Jaques (2010) aptly notes that non-linear construct includes related and integrated activities which may overlap or coincide. Nevertheless, the proposed model can lead to misunderstanding and different perceptions of the model's assumption. Even if the cyclical model is not linear assumes a particular sequence of events, because of consists of cycles of the circle. Based on Jaques model, I propose modified (figure 1) new crisis management relational model named three-dimensional crisis management model.
Figure 1. Three-dimension crisis management model
Source: Own elaboration based on Jaques 2007, 2010.

Jaques (2010) correctly postulates the organisational need to crisis preparedness includes many of the primary activities, such as planning processes, including traditional exercises and simulations. However, it may be

unnecessary to plan simulation based on experience from the past. It has to be supplemented by weak signals scanning. It seems that proposed orderly and logical nonlinear construct, which is, however, a phased structure, should be replaced by a three-dimensional structure, named "glue structure", where preventive activities, including among others, early warning systems and risk/issue management, are realised simultaneously with post-crisis management. Such an approach will enable limitation of adverse organisational, managerial, social, economical and political effects of crises. The cited author noticed it is a very natural human tendency to focus on moving on from the crisis as quickly as possible and returning to former conditions. There is an extensive literature on change management, where authors pointed out the organisational desire to back to the old track (Wilson, 1992; Kotter, 1996; Senior, 2002; Todnem, 2005). The barriers to management learning and organisational improvement in the aftermath of a crisis are also recognised (c.f. Elliott, Smith & McGuinness, 2000; Jaques, 2008). Jaques (2010) correctly notes that resistance by any organisation to a frank assessment of its shortcomings is understandable, but the post-crisis phase is necessary to improve the organisational activities.

Again, I conclude correctness of Jaques (2010) arguments that the effective way of counteracting crises is to institutionalise a crisis prevention mindset instead of just focusing on crisis response. This multifaceted approach includes but is not limited to a deep understanding of systemic causes of previous crises. Systemic failures are a known cause of significant crises. There is a lot of evidence from the past that limitations of faults were deliberately suppressed (Esser & Lindoerfer, 1989; Starbuck & Milliken, 2007, Jaques, 2010). Such a situation is usually fuelled by ethical gaps in organisations and a lack of trust in organisations. Therefore, the effective preparedness to the crisis requires a change of thinking and behaviour.

Believing that crisis is inevitable and upcoming should replace naive believe that organisation may omit crisis. In the situation of the organisation's functioning in the conditions of globalisation, the crisis will occur. Creating a culture of trust and openness is necessary to eliminate examples of hiding problems. I agree with Jaques (2010) and Brown (2002) that crisis is catalysed by lack of imagination and inadequate analysis; rather than due to lack of information. Therefore, I suggest the need to build "weak signals" thinking and change approach from forecasting to foresight.

3.2. Core values of Crisis Management

Review of literature showed that successful crisis management needs a culture based on openness to experience and change, creativeness, ethical behaviour. Taking into account these requirements, I modify the Norton and Kaplan balanced scorecard, and I formulate four core values of crisis management (Figure 2 and 3). I assume that a mechanism for building relationships and other intangibles between individuals and organisations are just as important as the ability to financing crisis management.
Figure 2. Balanced Core Values of New Crisis Management
Source: Own elaboration based on Kaplan Norton Balanced Scorecard.

To succeed in unpredictable environment, how will we sustain and develop our ability to change and make improvements?	Creativeness			
	Objectives	Measures	Targets	Initiatives
To achieve our goals, how will we sustain and develop our ability to act agility to effectively exist in unpredictable environment?	Agility			
	Objectives	Measures	Targets	Initiatives
To satisfy our clients which business processes must we excel at?	Ethics			
	Objectives	Measures	Targets	Initiatives
To achieve our vision how should we communicate to our clients?	Openness			
	Objectives	Measures	Targets	Initiatives

Figure 3. Elements of Balanced Scorecard of Crisis Management
Source: Own elaboration based on Kaplan Norton Balanced Scorecard

Effective crisis management requires the appropriate formulation of objectives, design and management of each of the three levels: organisation, process and workplace. I specify nine variables that create crisis management matrix (figure 4). Three variables affect the organisation's performance in each of its areas. They show ways in which the organisation's goals are achieved, the way of designing the activities and the way of managing the organisation may influence three levels of effectiveness: the level of organisation, the level of the process and the level of the workplace. This approach is similar to the one proposed by Rummler and Brache in achieving organisational effectiveness (Dobrowolski & Szejner, 2019; Rummler & Brache, 1995). I modify this approach adding the need to identify weak signals in nine variables of organisations.

Figure 4. Nine Variables of Crisis Management
Source: Own elaboration based on (Dobrowolski & Szejner, 2019; Rummler & Brache, 1995).

Conclusions

The aim of this research was achieved. The public organisations, entrepreneurs and consumers live in more uncertainly environment caused by the pandemic. In such circumstances, the risk-based approach is not sufficient. This research confirmed arguments of Jaques (2010) the need to establishing effective mechanisms to recognise and respond to weak signals. However, the non-linear model based on circle crisis management model needs to be

replaced by the three-dimensional model, where the flexibility of crisis management exists. I also confirm Jaques' (2010) postulate the organisational need to crisis preparedness includes many of the primary activities, such as planning processes, including traditional exercises and simulations. However, I argue that it may be useless to plan and carry out simulation-based on experience from the past. It hasto be supplemented by weak signals scanning. Concluding correctness of Jaques (2010) arguments that the effective way of counteracting crises is to institutionalise a crisis prevention mindset instead of just focusing on crisis response I argue that naive believing that organisation may omit crisis should be replaced by an approach that crisis is inevitable and upcoming. I agree with Brown (2002) that crisis is catalysed by lack of imagination and inadequate analysis. Therefore, I suggest the need to build "weak signals thinking" and change the approach from forecasting to foresight.

There were a lot of weak signals of the imminent crisis in the past, and it is unbelievable that no one identified the immediate threat. Further research and practice should enable determining why weak signals are ignored. Regardless of the future scope of research, based on literature study where the importance of social capital for the organisation functioning in an unstable environment is underlined, I propose to use the modified the Norton and Kaplan balanced scorecard, and I formulate four core values of crisis management. Besides, I noticed that effective crisis management requires the appropriate formulation of objectives, design and management of each of the three levels: organisation, process and workplace. I specify nine variables that create crisis management matrix, and I argue the need to identify weak signals related to each of this variable.

This article can be useful for practitioners. The important lesson here is not just identifying to a wide range of weak signals but also their analysis. Crisis costs too much because someone is to turn a blind eye to improper management practices.

Abstract. The paper deals with the solution of the issue of achieving customer satisfaction of the postal company. Through the diagnostic procedures used in quality management in services, the focus is on the application of KANO model as one of the customer satisfaction measurement models. The primary research carried out in four different districts of Slovakia identified the relationship between customer satisfaction level and quality attributes through 5 categories of perceived quality by customers. The categories were identified as attractive, one-dimensional, mandatory, insignificant and contradictory attributes of postal products that create their quality parameters and reflect the requirements of customers. Significant findings concern mainly the identified differences in survey results in individual selected districts of Slovakia. There were also differences in the categories of postal quality requirements in respondent segments that differed in gender, residence, or age of respondents. One of the conclusions of the solved issue is to propose framework therapeutic procedures in response to individual diagnostic statements that resulted from the performed research activities.

1. Introduction

Every company needs to know their customers to identify what are their requirements for the offered services. It is therefore clear that the importance of measuring customer satisfaction has been growing for a long time. Examining customer satisfaction has an irreplaceable place in the algorithms of marketing activities, whether it is the identification and measurement of customer satisfaction or customer dissatisfaction. Proof of this statement is that most research activities aimed at satisfaction research focus on the opposite view, customer dissatisfaction. This view is still currently part of contributions in major professional publications around the world e.g. Juznik Rotar, L. and Kozar, M. (2017) discusses this issue in the environment of modern online shopping. Other authors

(Mateides and Dado, 2002, Bostanci and Erdem, 2020, Alam et al. 2020) use modern and effective analytical procedures to investigate such a "simple" issues at first glance that include fuzzy multicriteria decision-making techniques and geostatic modules. Some authors, such as Jankalova and Jankal (2020), also link customer satisfaction research with the process of globalization and with the pressure to achieve and maintain the competitiveness of the enterprise on domestic and international market.

A customer is a person or institution that creates a demand for products or services. Customer satisfaction is achieved through the strict orientation of companies to meet customer requirements and expectations (Kmet, 2001). Customer orientation means an individual approach to the customer and learning from experience in order to maintain his/her satisfaction, among other things (Mateides and Dado, 2002).

In the literature, we encounter several definitions clarifying the concept of customer satisfaction. Standard STN 9000: 2015 Quality Management Systems – Basic Vocabulary (2015) defines this term as: "Customer satisfaction expresses the level perceived by customers to the extent to which their requirements have been met." Jones (1995) says that "needs and expectations are satisfied at all times, throughout the life of the product or service. Without it, we would not gain the trust of the customer." „Overall, customer satisfaction can be understood as the result of a complex psychological comparison process" (Hund 1997, Oliver 1980 according to Mateides, 1999, p. 10). Mateides (1999) states that satisfaction is "the result of a complex psychological comparison process, where the customer compares his/her own experience after using a product or service with expectations, desires, individual norms or other benchmarks". Rostasova et al. (2008) talks about "comparing customer expectations with reality. Of course, the expectations of each customer are different and influenced by the customer himself/herself. Their individual demands have a significant impact on customers' expectations." Kotler, Amstrong (2004) states that: "Customer satisfaction depends primarily on how far it is perceived or fulfilled customer expectations in relation to the acquired product or the value it brings to the customer. Successful companies strive to make their customers happy because then they buy the product repetitively and share their good experience, too" Kita et al. (2010) defines customer satisfaction as a „condition that the customer feels from the use of the purchased product or services, and which expresses the degree of compliance of the offer with the customer's expectations evoking his/her behaviour. Customer satisfaction is reflected in his/her repeated purchases."

The situation where customers are satisfied and they also show it through their purchasing decisions, we cannot yet call their loyalty. Satisfaction is a condition that can flip to one side or the other. One mistake is enough, and the customer can "replace" the company. If satisfaction is an expression of state, loyalty is the action that results from that state. To have loyal customers means, firstly to be sure that they do not buy from the competition, and that even in the case of a negative experience with the conduct of the company, they will not immediately go to the competitive company (Ligasova, 2013).

The term satisfaction of customer requirements means the perception and understanding of customer expectations that the company has fulfilled or exceeded through its activities.

Evaluating customer satisfaction identifies how customers understand the business. The evaluation of the satisfaction of the customer's requirements takes place only in his/her head and may or may not suit the actual situation. People form their attitudes quickly, but they change them very slowly (Mateides and Dado, 2002).

There are several theoretical approaches to measuring customer satisfaction, including for example: differential model of customer satisfaction, model of possible reactions, Kano model, model GAP 5 and others. New and new recommendations and procedures are constantly being created in the works of experts around the world and goes into absolute detail in the issue of achieving customer satisfaction. For example, Suarez (2015) presented how written communication with the customer should take place in order to achieve a higher degree of satisfaction in handling complaints and grievances. He pointed out the importance of the correct structure/content of written communication, punctuation, grammar, decency, etc.

We attribute customer dissatisfaction to negative feelings, such as disappointment that can arise from a comparison of an expected and perceived product or service. We can say that if the actual performance of the product or service is lower than the customer expects, the customer will be dissatisfied. The direct ratio applies here, the more the gap between the expectation and the actual performance/value of the product or service deepens, the more dissatisfied the customer will be. We understand dissatisfaction as the opposite of satisfaction. The following factors influence the increase in customer dissatisfaction (Salgovicova, 2005):

- ➢ Objective factors:
  - Variant selection - more equivalent alternatives - the customer decides more easily when choosing a product, if the selected variant significantly exceeds other possibilities of solving the problem. When the customer is deciding between several similar variants, his/her decision-making can also be influenced by rational stimuli;
  - Limited possibility of testing - in some areas of business, such as delivery services, the customer does not have the opportunity to get acquainted with the real properties of the product, which can cause him/her a feeling of post-purchase dissatisfaction. In such situations, it can use reference recommendations to "materialize" the offer;
  - Voluntary purchase - it seems paradoxical, but it often happens that when the customer does not have much choice when buying, he/she will accept it rather than with a larger selection, because he/she has no other choice;
  - The possibility of product return - we know from practice that in the phase of deciding between alternatives to the product, the customer behaves more tolerant. It is easier to decide if he/she knows about the possibility of returning the product. It is not pleasant for a company when a dissatisfied customer returns a product, but it helps to reduce the impact of various misunderstandings on the customer's further purchasing behaviour.
- ➢ Subjective factors:
  - Poor information - when the customer has little information about the product or service, which increases the possibility of his/her other expectations and wishes;
  - Customer personality - personality characteristics of the customer, e.g. a combination of indecisive nature with low self-confidence. This characteristic may result in a greater susceptibility to post-purchase non-compliance and consequently increased search of other product or service alternatives.

Recent research in this area (Lin, CC and Lai, FY (2020)) points to the existence of a relationship between the customer's insensitivity to customer benefits and the customer's overall perception of service quality.

Services have become an integral part of human existence. Their consumption is necessary for the existence of man and is a condition for his/her further development. They satisfy the full range of his/her needs. Experts agree on several characteristics of services that are linked to specific categories of services. They are useful features that make up their utility value and that could meet customer needs. The service is produced and provided to meet the needs of non-producers. They are products of labour that are useful other way than the creation of material goods. The production of services is currently one of the most important areas of economic development in developed countries. The provision of the service cannot usually be separated in space or time, services are usually consumed at the time and place where they are produced that results from their intangibility. When providing services, live work is needed above all, the results of this work are consumed in the provision. Services are one of the important components of living standards. They arose as an accompanying phenomenon of the production of many material goods. They make it possible to increase consumption, satisfy the higher needs of man and society. They gradually replace several material goods (Mateides and Dado, 2002).

Postal services are services provided for the purpose of delivering a postal item, namely the collection and distribution of a postal item (Act No. 324/2011). A postal service is not the creation of a postal item if the created postal item is not distributed by the person who created it or if, after creation, the postal item is handed over by the sender on behalf of the sender to the postal undertaking. The postal service is also not the transport of postal items if it is performed by a person who does not collect, sort or deliver and self-deliver for these postal items.

The universal service is the offer of postal services that serves to ensure the minimum satisfaction of the needs of all users of postal services in Slovakia to ensure the availability of access points of the public postal network and contact points of the public postal network under the same conditions, in the specified quality and price, each working day with at least one pick-up and delivery per day. The universal service provider is one or more postal undertakings. This provider is obliged to provide universal service on the basis of a postal license and under the conditions and in the manner specified by the relevant law. The universal service includes: collection and distribution of postal items weighing up to and including 2 kg; collection and distribution of parcels; collection and distribution of packages weighing up to and including 10 kg; distribution of packages weighing up to and including 20 kg, if they have been selected abroad by a foreign universal service provider; collection and distribution of registered items and insured items; collection and distribution of official consignments; services connected with registered postal items at most within the scope of additional services according to the rules for international postal services and return of the found postal item to the sender.

The services of Slovak Post are provided by leading providers of modern communication, distribution and payment services on the domestic market, with created logistics conditions for doing business in Central and Eastern Europe. It is a trusted mediator that meets the changing needs of customers and offers new products and comprehensive solutions with added value and high-quality service (www.posta.sk).

Slovak Post has been operating in the postal services market for over twenty years. It currently provides a wide portfolio of services. These include, in particular, relocation services (letter items, parcels), money services, procurement services, business services, services for telecommunications operators, e-government services, POSTshop, other services (newspaper and magazine subscriptions, TIPOS, postal folders, collection rides, customs negotiation of consignments, copying services, advertising services), postal philatelic service, personalized stamps (My stamp).

2. The analysis of the current situation in the environment of the national postal operator

The most important requirement of postal customers for the services provided is their quality. Quality is an important aspect that has come to the attention of postal service providers long time ago. The quality of postal services serves as a basic tool of the postal company to maintain and increase competitiveness in the market.

The quality is expressed as the conformity of correctly defined requirements that satisfy customer needs. The definition of the quality of postal services emphasizes the goal of quality of service, in which the needs and expectations of customers are met through a price that represents the value of the service. As with other service providers, the reasons for interest in quality issues in mail are defined according to several aspects.

In summary: competitive pressures between competing companies in the postal market, the demands of postal customers, rapid technological developments in the postal sector, customer expectations are constantly increasing, quality increases market success and leads to profitability, quality improves postal market image and reputation, massive education in the field of rights protection of postal company customer rights, stricter regulation of quality of postal services, introduction of quality management systems in postal company, positive benefits in growth of labor productivity, cost reduction, system planning orientation, human potential development, increasing knowledge of postal employees and a friendly environment within the postal company.

Improving the quality of postal services represents achieving a better level of quality compared to the previous state. The evaluation of customer satisfaction of postal companies consists in the application of various methods of measuring quality. The selected methods of quality measurement should be optimal for the postal company in terms of suitability for their use and should meet all the given requirements. Therefore, it is necessary to evaluate the quality measurement methods themselves.

Each method of measuring the quality of services has its specific features, which evaluate the specific features of the provided postal service. These aspects concern: time availability, availability of contact and access points, security during the relocation process, staff expertise, affordability of postal services, waiting time at post offices, handling of complaints and grievances and information on postal services (Diabelkova, 2013).

Other repeatedly used method of measuring customer satisfaction in the post includes the test customer method - Mystery shopping. This method is implemented through trained persons who are not real customers, but "play" directly in the operation the role of a real customer and evaluate the verbal and non-verbal communication of first contact employees, their expertise and other important aspects. Customer satisfaction with Slovak Post is also determined based on the implementation of primary quantitative research, carried out by the method of questioning. Respondents can express their satisfaction or dissatisfaction with postal services with their answers. The data is obtained by directly contacting a randomly selected customer at the post office. The survey is carried out by an external institution. Another method is the End to End Method, which is one of the non-electronic methods for monitoring the quality of postal services. It is focused on determining the time of the relocation process of several types of shipments.

In order to continuously improve the quality of universal service, the regulatory authority in the quality requirements prescribes the universal service provider to ensure the measurement of customer satisfaction with the quality of universal service. Table 1 presents the results of measuring customer satisfaction with the quality of the universal postal service in 2012–2018 (Diabelkova, 2016).

Table 1: Results of measuring customer satisfaction in 2012 –2018 (%)

Postal service quality indicator	2012	2013	2014	2015	2016	2017	2018
Adequacy of fees - letters			63,3	55,9			
Adequacy of fees - packages	66,5	61,5	62,2	53,3	60,6	75,5	76,0
Location and availability of post offices	81,9	79,0	75,1	78,0	83,4	90,0	90,0
Providing product information	79,5	76,6	72,0	73,8	85,6	93,0	93,0
Range of hours for the public - in the morning	83,2	81,4				94,0	93,0
Range of hours for the public - afternoon	79,0	76,0	74,6	76,8	83,9	92,0	91,0
Complaints handling	65,6	61,2	-	64,3	70,2	84,0	77,0
Ensuring the collection of notified consignments	77,9	77,4	75,5	74,1	84,1	85,0	88,0
Waiting time at the compartment	56,0	55,0	67,8	64,4	66,6	75,0	75,0
Overall satisfaction	**73,3**	**72,3**	**74,1**	**76,5**	**78,6**	**79,0**	**79,6**

Source: Diabelkova, 2016

The customer satisfaction measurement is performed once a year on a sample of at least one thousand customers. 1 050 respondents were questioned in the study on a sample in 2018. The reasons for dissatisfaction are analysed and measures are taken to eliminate the causes of dissatisfaction (see web page of *Regulatory Authority for Electronic Communications and Postal Services,* www.teleoff.gov.sk).

The results of the measurement of transit times in national postal services shall be published on the website of the regulatory authority. An overview of the results of measuring customer satisfaction and selected quality indicators in 2011 - 2018 (expressed as a percentage) can be found in Table 2. The universal service provider shall submit to the regulatory authority, in accordance with the Universal Service Quality Requirements, a methodology for ascertaining data on customer satisfaction with the provision of universal service.

Table 2: Results of measuring customer satisfaction with the quality of universal service

Individual quality criteria	Year / measurement results in%							
	2011	2012	2013	2014	2015	2016	2017	2018
Adequacy of postal fees	65,0	66,5	61,5	62,8	54,6	60,6	75,5	76,0
Ensuring the security of postal items	79,9	80,2	76,8	X	X	X	X	X
Ease of use of products - List	86,7	88,7	86,4	X	X	84,4	93,0	96,0
Ease of use of products - Package	80,1	84,2	81,5	X	X	84,4	91,0	95,0
Ease of use of products - PP	77,5	84,9	83,2	X	X	84,4	92,0	95,0
Location and availability of post offices	81,9	81,9	79,0	75,1	78,0	83,4	90,0	90,0
Behavior of employees - behind the compartment	78,2	83,9	83,3	78,2	81,3	88,2	93,0	93,0
Behavior of employees - deliverers	83,6	86,6	87,2	79,6	82,0	90,3	95,0	95,0
Providing product information	78,2	79,5	76,6	72,0	73,8	85,6	93,0	93,0
Providing product information on the SP website	X	X	X	68,2	74,8	85,5	91,0	93,0
Range of hours for the public - morning	83,6	83,2	81,4	74,6	76,8	83,9	94,0	93,0
Range of hours for the public - afternoon	75,8	79,0	76,0	74,6	76,8	83,9	92,0	91,0
Time and frequency of mailbox retrieval	73,9	76,9	74,0	X	X	X	X	X
Complaints handling	81,5	65,6	61,2	50,6	64,3	70,2	84,0	77,0
Ensuring the collection of notified consignments	74,7	77,9	77,4	75,5	74,1	84,1	85,0	88,0
Waiting time when picking up the shipment	64,4	56,0	55,0	67,8	64,4	66,6	75,0	75,0
Overall satisfaction	**76,0**	**73,3**	**72,3**	**74,1**	**76,5**	**78,6**	**79,0**	**79,6**

From the Table 2, is it clear that the goal of the postal operator, in the form of constantly achieving a higher quality of services provided in the selected category (universal postal service), has been increasingly fulfilled over the years.

However, such a goal is presented in the works of authors around the world in various areas of research. Giacomel, Cardoso and Santo (2019), deals with a proposal for measuring customer satisfaction in e-commerce, where these authors discover a "gap in the methodology capable of measuring customer satisfaction" in online shopping. They filled this gap with a design using elements of the SERVQUAL and SERVPERF methods, the Brazilian Quali Quanti model and national barometers for measuring service quality - Swedish, American and European.

3. Material and methodology

The aim of the paper is to diagnose customer satisfaction with postal products in selected areas in the Slovak Republic through the chosen methodology that the researchers consider to be effective and suitable for its application. Subsequently, in response to the stated diagnostic statements, to design framework therapeutic procedures in the environment of the postal company, in order to achieve the fulfilment of customer requirements and to achieve and maintain their loyalty.

The scientific methods used in this paper are clearly based on the application of analytical (including multidimensional analysis), synthetic and comparative methods that also represent recommended methods in the application of diagnostics and subsequently therapeutic methods in determining satisfaction with the quality of postal services. Separately, but at the same time compatible, the use of another method, the so-called Kano model is presented. Through this model, the diversity of customer requirements is emphasized according to their importance for achieving their satisfaction. It is based on the existence of two key dimensions of quality, which are: "the degree of fulfilment of customer requirements" and "the degree of customer satisfaction".
Fig. 1. Kano model of customer satisfaction

Source: Krnacova, P., Lesnikova, P. 2012

The Kano model (see Fig. 1) expresses the relationship between the degree of customer satisfaction and the attributes of quality through 5 categories of perceived quality by customers. These are: attractive, one-dimensional, mandatory, insignificant and contradictory attributes of products that create quality. In line with the product life cycle, these categories of perceived quality change. They range from the category of insignificant, through attractive, one-dimensional to mandatory quality attributes. This means that while at this point the customer may find a certain quality attribute attractive, it may be considered mandatory in the future. However, these rules may not apply to all products. It is more important to realize that the perception of individual categories changes over time. At the same time, attractive quality attributes clearly lead to customer satisfaction (Chen et al. 2010).

Based on the information above, the individual categories of product or service requirements that affect customer satisfaction can be characterized as follows:
- attractive requirements (A - attractive) - have a clear impact on customer satisfaction because these requirements the customer does not expect. At the same time, it logically follows that failure to meet these requirements will not lead to customer dissatisfaction;
- one-dimensional requirements (O - one-dimensional) - represent those quality attributes, the fulfilment of which leads to customer satisfaction and in case of non-fulfilment, the customer is dissatisfied. There is a direct linear relationship between meeting these requirements and customer satisfaction, e.g. the higher the compliance rate, the more satisfied the customer;
- mandatory requirements (M - must-be) - the customer takes them for granted, he automatically expects them. They can also be described as basic, which means that their fulfilment will be reflected in customer satisfaction, and at the same time, if they are not met, the customer will be very dissatisfied; as the customer takes these requirements for granted, he does not deal with them if they are met. The identification of the basic requirements is important mainly because the customer is immediately aware of their absence that will ultimately result in his/her maximum dissatisfaction;

817

- insignificant requirements (I - indifferent) - do not affect satisfaction in any way, customer dissatisfaction included; these are attributes that are not critical to the customer and he does not care whether they are met or not;
- conflicting requirements (R - reverse) - represent such quality attributes for which it is true that the higher the rate of their fulfilment, the more significantly the customer dissatisfaction grows (Chen et al. 2010).

In addition to the above 5 categories of product or service requirements, when compiling the Kano model, we may also encounter another category – ambiguous requirements (Q – questionable). A request included in this category expresses a problematic result as it usually indicates a certain problem, which is related either to incorrectly formulated questions or to the respondent's misunderstanding of the question. To include the request in this category, it would mean that the respondent answered in the same way for positive and negative. Under normal circumstances, no requirement should be assessed in this category.

The Kano model represents a diagnostic approach that is relatively popular in important professional publications and its use brings the desired results of research in various fields. Bi, JW. Liu, Y., Fan, ZP and Cambria, E. (2019) applied the Kano model in modeling customer satisfaction from online reviews using a neural network model. The result of this study was, among other things, a very accurate identification of the dimensions of customer satisfaction. Similarly, Madzík et al. (2019) applied the Kano model to better understanding of customer requirements in higher education. "Practice orientation" and "quality resources" have proven to be the most stable student requirements, while "quality staff" is the least stable.

The most direct requirement, a requirement that has the same effect on satisfaction and dissatisfaction, is an "innovation orientation". "Research orientation" is one of the attractive requirements. An interesting outcome is that "ethical orientation" shows weak relationships between positive and negative reactions of students. It is also surprising that "skills orientation" has proved to be too general a requirement and could be classified as one in which students show indifference (Madzik et al. 2019). Al-Dulaimi (2017) also contributed to this area of research, presenting a comparison of education, educational services and student satisfaction between selected countries with the rather surprising differences that emerged from the research results. Zhang (2019), who also used of the Kano model, conducted research on improving the quality of services of logistics companies, including postal companies that are the subject of research in our paper. The research presented by Zhang (2019) pointed to the so-called necessary quality of logistics services that includes the so-called first mile (delivery), timeliness and method of delivery, security of the shipment and convenient method of payment for these services. Another methodology that was used to address the issue is primary research. The research activities that led to the specific identification of the requirements defined in the Kano model in selected regions of Slovakia were based on primary quantitative research, where it was necessary to proceed with the correct definition of the sample of respondents in order to achieve the required reliability of research results. This reliability of the results and the possibility of other solutions affects the sample size. The sample size from 100 to 200 respondents can be considered an enough degree of accuracy, regardless of the size of the basic sample examined. Such many respondents satisfy the so-called normal probability distribution. We used a statistical method to calculate the sample size. The sample size is influenced by three basic factors (Foret, M., Stávková, J. 2003):

- Reliability of the estimate ($z_{1-\alpha}$ / 2) - usually ranges from 95% to 99%. The higher the reliability of the estimate is required, the larger the sample size. Its tabular critical value of the normalized distribution is inserted into the formula.
- Maximum allowable error range (H) - the range is usually in the range of $\pm$ 0.02 to $\pm$ 0.1. The smaller the error is tolerated, the larger the selection must be made.
- Variability of the base file or proportion of the character (p) - if this value is not specified, the value 0.5 will be used.

Sample sizes were calculated using the following formula (Foret and Stavkova, 2003):

$$n = \frac{z_{1-\alpha/2}^2 * \sigma^2}{H^2}$$

$$\sigma = \sqrt{p * q} = \sqrt{p * (1 - p)}$$

where the calculated variables represent:

n – minimum number of respondents;

z$_{1-\alpha/2}$ - critical value;

σ2 – variance calculated from the standard deviation;

p – variability of the basic set,

H – maximum permissible error range.

For the calculation of the sample of respondents, a 99% reliability of the estimate was determined, the critical value of which determined from the tables is 2.58; maximum permissible error range ± 0,1 and character ratio 0,5. Calculated values that were determined above where filled into the formula, so the sample for the district of Poprad was calculated as follows:

$$\sigma = \sqrt{0,5 * (1 - 0,5)} = \sqrt{0,25} = 0,5$$

$$n = \frac{2,58^2 * 0,5^2}{0,10^2} = \frac{1,6641}{0,01} = 166,41 = 167$$

The calculations show that the minimum sample size is 167 respondents for the district of Poprad. A similar recalculation was performed for the districts of Dolný Kubín (205 respondents), Martin (206 respondents) and Považská Bystrica (340 respondents) where this research activity also took place.

4. Results

4.1 Requirements categorization for postal services of Slovak Post in selected regions

Based on the evaluation of individual requirements in the Kano model, the answers of the respondents were divided into questions formulated positively and negatively into the relevant categories set by the Kano model. The meaning of individual categories is: "M" - mandatory requirement; "O" - one-dimensional request; "A" - an attractive requirement; "I" - insignificant requirement; "Q" - ambiguous requirement and "R" - conflicting requirement. The rule that M> O> A> I was applied in the evaluation of the requirements.

The summarized results of marketing research in individual districts are shown in Table 3.

Table 3: Customer requirements for postal services by importance in the listed regions.

Region	A	Rel. ab.	O	Rel. ab.	M	Rel. ab.	I	Rel. ab.
Dolny Kubin	Opening hours in the afternoon	**24,4**	Waiting time at the compartment (< 15 min)	25,8	Reasonable charges for postal services	31,1	Availability and distribution of post offices and mailboxes	35,1
	Openning hours during weekend	**28,4**					Use of self-service facilities at the post office	32,9
	Letters and parcels processing 24/7	**32,9**					Payment by credit card	34,2
							Use of self-service facilities in the shopping center or publicly available place	34,7

Martin	Opening hours during afternoon (after 3pm)	**28,6**	Availability and distribution of post offices and mailboxes	39,1	Waiting time at the compartment (<12 min)	64,3	Reasonable fees for services provided	34,3
	Openning hours during weekend	**52,0**	Employees behavior	28,6	Security of shipment delivery	40,5	Informativeness of provides services	32,4
					Handling of complaints and grievances	51,4		
Poprad	Openning hours during weekend	**46,63**	Security of shipment delivery	69,10	Postal service fees	58,43	Availability of post offices and branch mailboxes	41,6
							Parking spots nearby	37,1
					Willingness and helpfulness of employees.	53,93	Informativeness of provides services	38,8
	Opening hours during afternoon (after 3pm)	**43,26**	Waiting time at the compartment	65,17			Electronic services offer	33,2
					Handling of complaints and grievances	44,38	Post office interior	46,1
							Identification of employees by logo	38,2
Povazska Bystrica	Opening hours during afternoon	**42,90**	Security of shipment delivery	64,6	Waiting time at the compartment (<12 min.)	47,8	Reasonable fees for services provided	40,9
							Parking spots nearby	37,4
	Openning hours during weekend	**36,23**	Willingness and helpfulness of employees.	53,3			Identification of employees by logo	34,5
							Informativeness of provides services	34,5
	Electronic services portfolio	40,00	Handling of complaints and grievances	82,6			Availability and distribution of post offices	48,4
							Reserved seating area	31,0

Source: own processing

From the Table 3 that determines the order of requests for postal services according to their importance in the region of Dolny Kubin, it is clear that the most important for respondents is the attractive requirement opening hours during afternoon, followed by opening hours during the weekend and sending letters and parcels 24/7. In the Martin region, an attractive requirement for respondents is the post office opening hours during afternoon, specifically after 3 pm and the opening hours during the weekend. In the Poprad region, respondents identified "reasonable postal service fees" as the most important requirement and "identification of employees by logo" as the least important. In the Povazska Bystrica region, the most important attractive requirement for respondents is the opening hours during afternoon and during the weekend and they are also interested in the portfolio of electronic services.

4.2 Diagnosis of the obtained examination results by categorization

In general, when conducting primary quantitative research, summarizing the whole data set obtained gives us a global view of the subject of research, in our case the requirements for the quality of postal services, but does not answer the question of respondent's expectations that should be met. The diagnostic procedure that is chosen in this part of the presented article consists in categorizing the obtained data using multidimensional analysis. The second level categorization represents the filtering of answers to research questions depending on the gender of the respondents, i. j. for men (m) and for women (w) who were in the position of respondents. The presentation of this diagnostic procedure was performed on data obtained by primary research in the district of Poprad. (Tab. 4). The diagnostic procedure chosen in this part of the presented article consists in categorizing the obtained data using multidimensional analysis. The second level categorization represents the filtering of answers to research questions depending on the gender of the respondents, for men (m) and for women (w). The presentation of this diagnostic procedure was performed on data obtained by primary research in the Poprad region (Tab. 4).

Table 4: Categorization of requirements for the quality of postal services according by the gender of the respondents

Requirements for postal services in the Poprad region	Requirements category												Summary			Divided by gender	
	M		O		A		I		Q		R						
	m	w	m	w	m	w	m	w	m	w	m	w	m	w	total	m	w

Source: Diabelkova, M. 2016

Diagnostic statement number 1: Gender quality requirements for postal services differ in four categories. Requirement "Opening hours of the Slovak Post during afternoon "is included in the men's segment as attractive but women described it as one-dimensional. In the case of the requirements "Availability of post offices and post boxes" and "Parking spots nearby", men classified them as one-dimensional requirements and women as insignificant. Men stated "Handling of complaints and grievances" as one-dimensional requirement and women in mandatory requirements category.

In another two-level categorization, the relationship between the requirements for the quality of postal services and the residence of the respondents was examined, residing in the city of Poprad (PP) or outside the city of Poprad (outside PP) (Table 5).

Table 5: Categorization of requirements for the quality of postal services according to the residence of respondents

Requirements for postal services	M		O		A		I		Q		R		Summary			Result by residence	
	PP	Outside PP	PP	Outside PP	PP	Outside PP	PP	Outside PP	PP	Outside PP	PP	Outside PP	PP	Outside PP	☐	PP	Outside PP
Adequacy of postal fees	**32**	**36**	30	15	4	5	25	30	0	0	0	1	91	87	178	M	M
Opening hours during afternoon	12	10	27	23	**30**	**32**	22	22	0	0	0	0	91	87	178	A	A

Source: Diabelkova, M. 2016

Diagnostic statement number 2: Respondents' requirements differ in five categories of postal service quality requirements. "Availability of post offices and post boxes" was determined by respondents who live outside the city of Poprad as a one-dimensional requirement but they who live in the city marked it as insignificant. "Parking spots nearby" was identified by respondents from the city of Poprad as a one-dimensional requirement, respondents living outside the city considered it as insignificant. "The willingness and helpfulness of employees" respondents living in the city of Poprad marked as mandatory but respondents living outside the city marked it as a one-dimensional requirement. "Informativeness of provides services" respondents living in the city identified it as insignificant but respondents whose residence is outside the city of Poprad marked this requirement as mandatory. "Handling of complaints and grievances" was identified by respondents from the city as a mandatory requirement but respondents living outside the city identified it as insignificant.

Subsequently, the relationship of individual requirements for the quality of postal services with the age categories of respondents was diagnosed through a two-level categorization. The age categories of the respondents were divided into five groups (Table 6). Evaluating this research, we know the sample is not properly stratified, so the same number of respondents was not reached in the individual segments. Despite this fact, the explanation of the research results is considered adequate.

Table 6: Categorization of requirements for the quality of postal services according to the age of respondents

Requirements category	Age	Adequacy of postal fees	Opening hours during afternoon	Opening hours during weekend	Waiting time at the compartment	Availability of post offices and mailboxes	Post office interior	Parking spots nearby	Willingness and helpfulness of employees	Identification of employees by logo	Informativeness of provides services	Security of shipment delivery	Handling of complaints and grievances	Electronic services offer

Source: Diabelková, M. 2016.

Diagnostic statement number 3: There was a large difference in the requirements of respondents in different age categories. Only in the requirement "Security of shipment delivery", respondents of all ages did agree that it is a one-dimensional requirement. "Opening hours during weekend" was marked by the age group over 60 as an insignificant requirement but other age groups marked it as attractive. The age category from 18 to 29 years stated the requirement "Availability of post offices and mailboxes" as mandatory but all other age categories identified it as insignificant. "Post office interior" was described by the first four groups as insignificant but the category of 60 years and older respondents considers it as one-dimensional. The age category from 30 to 39 years determined "Informativeness of provides services" as a mandatory requirement but the other groups classify it as an insignificant requirement. All categories clearly consider "Security of shipment delivery" as a mandatory requirement but in 50-59 years old category, respondents have identified it as irrelevant. In the categorization of requirements, we have included "Electronic services offer" between the insignificant requirements but the age group 18-29 years has determined this requirement as mandatory.

4.3 Therapeutic procedures based on the obtained research results

If diagnostic procedures determine the extent to which the characteristics of the postal service affect their perceived quality, how individual satisfaction (M), one-dimensional (O) and attractive requirements (A) for the quality of postal services affect customer satisfaction and what is the evaluation of postal services from customers' point of view compared to the competition, the postal company is expected to develop a portfolio of procedures to ensure customer satisfaction. The highest priority for ensuring the satisfaction of the postal company's customers is those customer requirements for the postal service that the customer considers to be the most important. However, it is also necessary to pay attention to those requirements that show insignificance (I), ambiguity (Q) and even contradiction (R).

Within the framework of therapeutic procedures, it is possible to recommend the examination of several dimensions that could contribute to the clarification and, in a way, to the influence of the quality of postal services. These are the following dimensions:

- adjustment and implementation of innovative changes in the environment that affect the mail customer - the acceptability of the environment in providing postal services, including own premises, surroundings, equipment (including self-service boxes, applications, etc.), as well as behaviour of employees during the first contact;
- increasing the reliability of the provided postal services - increasing the ability to provide the required postal service with all the quality features that the operator can provide;
- increasing the sensitivity of the approach to the customer - increasing the willingness and flexibility with which the first contact employee will be able to solve customer problems;
- increasing the qualification of postal employees by achieving competencies for the implementation of relevant processes in the provision of services - professional knowledge, courtesy, trustworthiness of employees;
- empathy with the individual wishes of the customer - readiness and sensitivity to the individual wishes of the customer, which can be fulfilled from the point of view of technology, law and security;
- periodic examination of the causes of "incomplete quality" of the provision of postal services by defining the so-called "5 gaps" where the following differences are identified:
  - difference 1: between customer expectations and the understanding of these expectations by the management of the postal company;
  - difference 2: between management of the postal company and understanding of customer expectations and their enforcement in the specifics of postal services;
  - difference 3: between the specifications for the provision of the postal service and the actual performance of the employees of the postal company (insufficient qualification of employees, incorrectly implemented internal quality management system, problems in enforcing teamwork, etc.);

- difference 4: between the declared and actual provision of the postal service;
- difference 5: between the customer's expectations and the customer's experience with the provision of postal services (comparison of the expected and desired service with reality).

Discussion and conclusion

The professional community has taken the idea that if there is nothing to discuss in a issue, there is no reason to write such a contribution. Therefore, if we understand customer satisfaction, which we dealt with in the article, as the result of a complex psychological comparison process during which the customer compares his/her own experience after providing the service, there are many questions to discuss on this issue. First of all, it is about understanding the great complexity of personal feelings (pleasure or disappointment) that result from his/her personal comparison of the actual performance in the provision of postal services with the expected one. In case of dissatisfaction and failure to meet expectations, competing postal companies get a chance. So, can we cover all the psychological aspects of customer decision-making through the most used methods of measuring customer satisfaction and knowing their requirements so far? It could also be a stimulus to discuss how it is possible and explainable that there are certain differences between the requirements for the quality of postal services in individual regions of Slovakia and how this fact should be reflected in the strategic decision-making of the postal company.

Focusing on customer satisfaction represents the strategy of the postal company in the long term and in investing in a wide range of activities aimed at current and future customers. So, is the postal company's strategy for finding ways to increase customer satisfaction clearly defined? If so, how is it necessary to innovate for the next period, with the dominance of the use of information and communication technologies? What form should build relationships with customers in the so-called the digital age?

The whole spectrum of topics for discussion, in connection with the topic of the paper, can be presented in connection with the transfer of a "satisfied customer" to the position of a "loyal customer". It is generally true that loyalty, often referred to as customer loyalty, is the result of customer satisfaction. For the customer to be loyal, the postal company's product strategy must be reworked as precisely as possible, because the customer must be firstly satisfied with the product that the postal company creates.

The issue of certain differences that emerged as the results of research activity within the examined regions also appears to be a well-founded area that provokes discussion. For example, the requirement "Availability of post offices and post boxes" was determined by respondents who live outside the city of Poprad as one-dimensional but they who live in the city marked it as insignificant requirement. "Parking spots nearby" respondents from the city of Poprad identified as a one-dimensional requirement, respondents living outside the city considered it as insignificant. "The willingness and helpfulness of employees" respondents living in the city marked as mandatory and respondents living outside the city marked it as a one-dimensional requirement. "Informativeness of provides services" respondents living in the city identified as insignificant but respondents whose residence is outside the city of Poprad marked this requirement as mandatory. "Handling of complaints and grievances" was identified by respondents from the city as a mandatory requirement but respondents living outside the city identified it as insignificant. These diagnostic statements could then be examined in more detail, as each region has relatively significant specifics in the area of district population and thus is likely to differ in identifying their requirements for the quality of postal services. This phenomenon is still widely studied around the world today (Rosillo-Diaz, E et al. (2020)). The results of their research showed a significant impact of cultural dimensions on the quality of products and services, measured by identifying several types of risk associated with this type of trade.

Loyal customers are very interesting for the postal company, because it is they who will spread the information about the quality of the provided postal service further, and thus the postal company can gain more customers

and build a very positive image in the postal services market. In a postal company, it is not enough just to understand the importance of customer satisfaction, respectively consequences of their dissatisfaction, but appropriate measures must also be taken. By this we mean the quantitative and qualitative survey and measurement of customer satisfaction in order to have adequate data and information. Without effective customer satisfaction assessment and evaluation, it is unlikely that the management of a postal company will make and implement decisions that would make it possible to retain the customer more effectively.

THE INFLUENCE OF FOREIGN INVESTORS ON THE DEVELOPMENT OF POLISH ENTERPRISES – A CASE STUDY OF THE BPH BANK

Waldemar Milewicz

Warsaw School of Economics
al. Niepodległości 162, 02-554 Warsaw, Poland

E-mail: wmilew@sgh.waw.pl

Abstract. According to the definition proposed by the Organisation for Economic Cooperation and Development (OECD), foreign direct investment means investment that causes long-lasting relationships. In turn, the latter reflect an interest of an economic entity of one country in an economic entity of a country other than the country of permanent residency of the direct investor. Foreign investors do not only provide production capital in privatized companies, but most of all technical know-how and the know-how on the performed economic activity. They send their specialists who should introduce international standards in daughter companies smoothly and eliminate the previous insufficient level of performance. Due to specific "spreading" of imported know-how the effect of boosted performance also affects domestic enterprises which have not been privatized yet. In this paper, the author will demonstrate the impact of a foreign investor on the development of Bank Przemysłowo-Handlowy in Cracow. A literature review will be used for this purpose, i.e. transaction documentation and post-audit statements of the Supreme Audit Office and delegations of the Ministry of State Treasury. The picture of how Hypovereinsbank has influenced the operation of BPH after the acquisition of shares will be presented as an outcome of this review. It is, thereby, a good example of denying the popular opinion about exploitation of local employees by foreign companies.

Keywords: foreign direct investment; know-how; performance

1. Introduction

According to the definition proposed by the Organisation for Economic Cooperation and Development (OECD), foreign direct investment means investment that causes long-lasting relationships. In turn, the latter reflect an

interest of an economic entity of one country in an economic entity of a country other than the country of permanent residency of the direct investor (OECD 2008).

Foreign direct investment may be treated as capital investment. It is done outside the country the investor is resident in. Its objective is to undertake economic activity from the ground up or to acquire ownership rights to an existing enterprise, in a scale allowing direct participation in management (Karaszewski 2004).

One can also encounter definitions that present foreign direct investment in a financial approach. This approach defines foreign direct investment as a form of international capital flows (for more see: Globan 2018). It is a response to the differentiation of the level of interest rates in individual countries. Therefore, foreign direct investment is located in a country of a higher interest rate than the one established in the investor's home country (Przybylska 2001).

According to Volker Lederer the import of capital may take place, apart from direct investment, through portfolio investment. According to his interpretation, foreign investor's involvement serves solely the aims of investing capital (without having influence on the financed company) (Lederer 1998). From the investor's point of view, it is the aim of the capital investment that is of prime importance. In turn, direct investment is understood by the said author as taking over an enterprise's activity by the investor in a company that is "foreign" to him" Direct investment in principle may be carried out in two different ways. On the one hand it entails establishing a new company (with or without participation of another local trade partner). On the other, such investment may take place through acquisition of shares in an already existing enterprise (McCulloch 1993).

Private economic operators in transition economies did not have enough savings to purchase shares in state companies at suitable prices. The state does not have the capability to achieve maximization of profit having only domestic investors at its disposal. This is why, from the financial point of view, it seems advantageous to expand the investment circle to include foreign investors (or possibly to carry out privatization only with the aid of foreign investors). Moreover, rapid inclusion of foreign, international in particular, enterprises to the national economy evens out the deficiency in competitiveness between domestic operators (for more about competitiveness see: Zeibote et al. 2019).

Parent companies do not have merchandise that would be competitive on international markets – the reason lies in the lack of know-how, outdated technology or inadequate product quality. Enterprises with foreign participation usually feature a high share of equity, use modern technology and pay above-average remunerations. Based on investment data of foreign companies, it can be concluded that they carry out restructuring more quickly and more intensively than comparable companies with purely domestic participation. This indeed can lead to short-term high unemployment rates. Nevertheless, in a long run, thanks to later investment the development of a company that has been taken over will be more balanced.

As many literature sources show (look it up in references – for example the case of Slovakia), foreign direct investment plays crucial role in given country (Táncošová, 2019; Fabuš et al. 2018). Foreign investors do not only provide production capital in privatized companies, but most of all technical know-how and the know-how on the performed economic activity. They send their specialists who should introduce international standards in daughter companies smoothly and eliminate the previous insufficient level of performance. Due to specific "spreading" of imported know-how the effect of boosted performance also affects domestic enterprises which have not been privatized yet (Dieckheuer 1990).

Since the beginning of the transformation, the Polish government has been aware of the importance of foreign investors in the process of "renewing" the economy. Despite the initial resistance among the population, it was

noted that bringing in share capital and professional knowledge by foreign investors would serve the modernization of the production and services sector. Foreign models of involvement as companies took different forms. The more production capital and know-how is provided to transition economies, the more foreign companies can enjoy the advantages of a given country such as a low level of wages or good education of the workforce (Wilhelm 1996).

Despite above mentioned advantages of privatization, it can also bring some shortcomings in the long run. In accordance with that opponents of privatisation have condemned it as "selling the family silver to pay the bills". In their opinion, the government, and thus society at large, loses from privatisation, because it gives up a positive stream of cash flows (potential dividends) and puts it in the hands of private buyers (Marques-dos-Santos 2007). Against this background problem of another nature arises. In case of public water companies or rail companies after privatization, private monopoly is created. Therefore there is still need for government regulation, similar to under state ownership (to prevent abuse of monopoly power). Furthermore, privatised businesses are more likely to focus on profit (for more see: Kunitsyna et al. 2018.). This can be bad if the profit-maximising activities of the private business hurt society. If natural monopoly public enterprises are privatized and unregulated in an environment in which property rights are not secure, management is very likely to take an extremely short run view of profit maximization (for more see: Bradburd 1992). The "take the money and run" policies implied by this will yield all the undesirable deadweight loss and distributional consequences of private monopoly and none of the efficiency and service improvement benefits. Private sector managers may have no compunction about adopting profit-making strategies or corporate practices that make essential services unaffordable or unavailable to large segments of the population (Goodman 1991). A profit-seeking operation may not, for example, choose to provide health care to the indigent or extend education to poor or learning-disabled children (Pettinger 2017).

What is also crucial privatization increases income inequality through the decline of contracted workers' wages and benefits. When governments directly provide a service, they often provide living wages and decent benefits to workers. When private companies take control, they often slash wages and benefits in an attempt to cut labor costs, replacing stable, middle class jobs with poverty-level jobs. Reduced worker wages and benefits not only hurt individual workers and their families, but also local economies and the stability of middle and working class communities (Cohen 2016).

Nevertheless, in this paper the author will demonstrate the positive side of privatization and namely the impact of a foreign investor on the development of Bank Przemysłowo-Handlowy in Cracow. A literature review will be used for this purpose, i.e. transaction documentation and post-audit statements of the Supreme Audit Office and delegations of the Ministry of State Treasury. The picture of how Hypovereinsbank has influenced the operation of BPH after the acquisition of shares will be presented as an outcome of this review. It is, thereby, a good example of denying the popular opinion about exploitation of local employees by foreign companies. Furthermore, novelty of my research consists in detailed description of ownership changes in banking with regard to its impact on the both certain company as well as thereby the development of capital market in Poland (for more information about privatization strategies in Poland see: Massmann 2002).

2. Agreement between the State Treasury of the Republic of Poland and Bayerische Hypo- und Vereinsbank AG - sale of shares of Bank Przemysłowo-Handlowy

In January 1995, an agreement between the State Treasury of the Republic of Poland and Bayerische Hypo- und Vereinsbank AG was executed for the sale of shares of Bank Przemysłowo-Handlowy and, thus, Bank Przemysłowo-Handlowy in Cracow was privatized. It was decided in the agreement that HVB's performance

thereof will involve carrying out investment obligations and fulfilling obligations concerning employee matters and other obligations resulting from the agreement (Supreme Audit Office, 2006).

Bayerische Hypo- und Vereinsbank Aktiengesellschaft, headquartered in Munich (now UniCredit Bank AG) is a universal bank. With its subsidiaries it is one of the leading providers of banking and financial services in Germany. It offers a comprehensive range of banking and financial products and services to retail, corporate and public-sector customers, international companies and institutional customers. HVB Group has a well-developed network of branches in Germany, which was modified to accommodate changing patterns of customer behaviour in recent years. In total, HVB Group has 503 offices around the world – 348 of which are HVB offices in Germany.

Bank BPH, in turn, is a Polish universal bank. Until 2008, it was majority owned by UniCredit. In 2008, GE Money Bank took over 89% of shares and on 31 December 2009, Bank BPH merged with GE Money Bank Polska. At its peak, the bank employed over 10,000 people. In October 2014, the bank's owner, General Electric, revealed it was considering selling the firm. In late 2016, Bank BPH was purchased by Alior Bank. Operations of the two banks merged in early 2017 (Hypovereinsbank 2018).

It terms of the development of the distribution network, Hypovereinsbank supported the strategy of continuing existing main directions of development of BPH's distribution networks. It involved the establishment of small branches. They were located in areas with a high concentration of medium- and high-income customers. Great emphasis was also placed on the development of new, electronic distribution channels (on the basis of the Profile system). The said activity of the strategic investor was reflected in numbers. Thanks to the activity of Hypovereinsbank:
  - the number of BPH branches doubled before 2001 to reach the target situation of 400 bank branches,
  - cash machines were installed at a pace corresponding to the number of newly-opened branches,
  - bank branches in all new voivodship cities were launched,
  - the concept of a multi-option bank was implemented.

All of the above facts resulted in BPH becoming a stronger bank in a financial and market angle (i.a. a retail network).

Hypovereinsbank also initiated the Bank's Development Programme. It included a development programme of individual market segments. As a part of it, thanks to the strategic investor:
  - banking services for enterprises were improved (customers of Vereinsbank Polska and Hypo-Bank Polska were transferred to BPH; new customers were acquired, including enterprises with foreign capital participation; this was done through the network of BPH branches with the support of Hypovereinsbank);
  - an intensive training programme for BPH personnel was implemented;
  - leaders of a local character were acquired, mainly in the area of small and medium-sized business;
  - existing and new banking products were developed (in particular: financing foreign trade, electronic banking, cash management, leasing);
  - retail banking was developed (the standard of customer service was improved); further segmentation of customers was carried out by focusing on 3 groups of customers of the retail market:
  a. highest earning customers (private banking),
  b. medium- and higher-earning customers (making a living mainly by working for the bank's corporate customers),
  c. youngest customers (who are the fundament for creating a future base of high-earning customers)

Moreover, the strategic investor Hypovereinsbank contributed to:

- the development of BPH's alternative distribution channels (e.g. telephone banking or Internet services); this was done mainly through offering mortgage banking services and distribution of life insurance policies and granting consumer credit,

- the development of the product portfolio.

Furthermore, Hypovereinsbank provided BPH with experience in terms of:

- methods for selling and providing services, marketing and performance management,

- investment banking - Hypovereinsbank provided support to BPH in the development of the following planes of investment banking:

a) capital market operations i.e. services-related organization of issuing debt instruments (bonds) and shares,

b) trading of securities on the secondary market,

c) corporate finance, i.e. consulting at mergers and acquisitions, privatizations and general consultancy for selected customers;

- developing a full package of products related to asset management (including analytical and advisory activity);

- mortgage banking (a mortgage bank was created on the basis of Hypo-Bank Polska, subsidiary to BPH); it became a development platform for BPH's mortgage activity; the strategic investor developed the following in BPH in this period:

a) a full range of mortgage banking products for corporate and retail customers;

b) distribution channels for mortgage banking products on the basis of BPH's branch network;

c) activity in the field of covered bonds (they were a basic instrument of refinancing the mortgage portfolio);

d) IT systems (they supported the distribution of mortgage banking products and management of the mortgage portfolio).

Moreover, in terms of development and human resources management Hypovereinsbank aided the development of the remuneration system in BPH. This system encouraged employees to work effectively, it increased employee loyalty and created an opportunity of real enhancement of individual earnings (for more see: Androniceanu et al. 2017). The strategic investor also supported the introduction of an intensive training programme. It included general and specialist training for BPH's employees and management carried out in Poland and in renowned international training centres. As a result, thanks to Hypovereinsbank BPH's employees were given the opportunity to participate in various thematic courses (including risk management, mortgage banking, investment banking and treasury activities).

3. New technological systems in the bank

After BPH had acquired a strategic investor, consistent implementation of the agreed directions of development was launched in the bank. Consequently, Hypovereinsbank initiated breakthrough undertakings. They significantly contributed to a successive transformation of BPH into a modern financial institution. Owing to this it was able to face the challenges resulting from the ever more competitive market. The following must be included among the said breakthrough undertakings:

- ensuring the opportunity to use PROFILE, a centralized IT system (it was implemented in the central office and throughout the distribution network; at the end of 1998 the system was rolled out in approximately 20% of bank branches and the finalization of the implementation took place in 1999);

- in terms of IT systems, BPH purchased additional licences; they authorized the use of PROFILE, an integrated banking transactional system; this took place in connection with the development of the network of bank branches and the e-MCI interface; the e-MCI interface served to integrate the Cortex system with the

PROFILE system in an on-line mode be means of Middleware, a banking system – the strategic investor allocated PLN 1,854,562 for this purpose;

- the strategic investor made capital investment for the development of Cortex; this system served to manage the network of cash machines and to authorize transactions (made by cards issued by the bank); Informix database programmes were purchased for the Cortex system; the strategic investor spent PLN 7,206,739.57 on Cortex;

- the strategic investor undertook capital expenditure for the development of online banking systems; they made it possible to submit instructions which concerned customers' orders in an electronic form; they also allowed for the introduction and development of online banking; electronic and online banking systems made it possible to launch a new additional distribution channel and to expand the array of offered services; Informix database programmes were purchased for the electronic and online banking systems; the strategic investor spent PLN 6,949,339.60 in total on electronic banking systems;

- the strategic investor created a data warehouse, i.e. the Information System for the Management (MIS-1); it included reporting sheets obligatory for NBP and sets of basic economic indicators; Oracle's database programme was purchased for the Information System for the Management; the investor also made capital investment for the BPH Brokerage House in terms of programmes and licenses; funds were allocated for developing the following programmes: Makler, POK-Makler, Sponsor, Vivaldi; moreover, Hypovereinsbank purchased a license for a brokerage application PROMAK and rolled it out – in order to boost the efficiency and enhance the quality of customer service; the new brokerage application made it possible to adapt the BPH Brokerage House system to cooperation with a new stock exchange system (SES) introduced by the Warsaw Stock Exchange; the investor purchased an online customer service system of the vIBank Norkerage House and a database programme Informix for the PROMAK application; the costs incurred by the strategic investor for programmes and licences for the BPH Brokerage House amounted to PLN 2,701,428.69;

- as regards Kondor +, Hypovereinsbank purchased rights to use this system; it also undertook capital expenditure for the implementation and development thereof – the system served to register, monitor and manage risk and to control counterparty risk broken down into individual products; the strategic investor purchased Sybase, a database system, for Kondor +; PLN 5,845,466.86 in total was spent on the Kondor + system;

- in the matter of the Middleware system, Hypovereinsbank purchased utility software for BPH; this enabled the creation of a system which integrated external IT systems with a transaction system; the strategic investor spent PLN 5,085,468.99 in total on the Middleware system;

- Hypovereinsbank purchased and rolled out the Imex system; it served to support the processing of documentary operations (documentary collection, letter of credit); the strategic investor spent PLN 520,432.13 in total on the Imex;

- Hypovereinsbank purchased a licence for and rolled out application software ELBA 24; this provided communication between the server operating bank balance printers and the transaction system; the strategic investor purchased ProTopas and ProView system software; it was indispensable in building the functionality of the self-service transaction terminal; it was to allow the performance of financial services; the strategic investor spent PLN 1,057,815.10 in total on the ELBA 24 application software;

- Hypovereinsbank purchased the MySAP.com system for human resources management in BPH; the strategic investor spent PLN 840,723.45 in total on the MySAP.com system;

- when it comes to reporting systems, Hypovereinsbank purchased and made capital investment for the development of computer (system and application) software for handling reporting to NBP and other reporting (including reporting to the strategic investor); the strategic investor spent PLN 3,054,749.50 in total on reporting systems;

- as regards other systems, Hypovereinsbank purchased other computer programmes for BPH's internal needs (application and database software); the strategic investor spent PLN 3,240,002.41 in total on other systems;

- in terms of back-up system centres, Hypovereinsbank undertook capital expenditure for building back-up centres for BPH's computer systems; these centres operated under the control of the LN and Unix operating

systems and for the Profile System, and also for the system of creating back-up copies; the strategic investor spent PLN 8,370,093.41 in total on back-up system centres;

- in the matter of computer systems of BPH's head office, Hypovereinsbank made investments in expanding servers which worked for the LN and Unix systems; moreover, it introduced and rolled out the Windows IT application in central management of work stations in BPH S.A.'s branches as well as Help-Desk management systems and a central archiving system; the strategic investor spent PLN 22,613,287.87 in total on the head office's computer systems;

- Hypovereinsbank purchased licences for servers and work stations as well as office suites, system and utility software; the strategic investor spent PLN 23,776,642.58 in total on the licences;

- Hypovereinsbank undertook capital expenditure concerning a technological merger; it was associated with a key stage of integration of BPH S.A. with PBK S.A.; it involved combining IT systems of both banks; as a result, the integration of the IT systems allowed customers to use a comprehensive product offer in any of the 500 or more bank branches; the technological merger expenditure amounted to PLN 479,812.34

- the remaining investment expenditure was undertaken by the strategic investor for a central printing office; due to the roll out of the centralized PROFILE system it became necessary to ensure the technical infrastructure to service the entire bank network (printing bank statements) - the strategic investor allocated PLN 7,259,354.98 for this purpose.

- Hypovereinsbank, the strategic investor, allotted further investment expenditure for the "Cherry Business Park"; the investment involved the preparation of rooms for the bank's head office units located in Warsaw; it was connected with the introduction of organizational changes in BPH – PLN 1,724,159.88 was set aside for this project.

- Hypovereinsbank also made capital investment associated with ensuring adequate technical infrastructure; the new infrastructure became an element of restructuring the back-office centre and the server room – the strategic investor allocated PLN 12,356,600.47 for this project.

- Hypovereinsbank undertook investment expenditure for regional cash centres; the investments made were a consequence of outsourcing cash settlement to the company Międzybankowe Centrum Gotówki Sp. z o.o.; it entailed the development of an adequate technical infrastructure – the strategic investor allotted PLN 6,325,701.51 for this project.

4. New banking systems in the company

Moreover, the strategic investor's significant contribution to the development of BPH is evidenced by the following facts:

- the implementation by Hypovereinsbank in BPH in 1999-2000 of online banking for retail customers and customers from the group of small enterprises;

- adoption by BPH S.A.'s Supervisory Board of the "BPH S.A.'s development strategy for 2000-2004"; it outlined direction of development on individual market segments – retail banking, corporate banking, international markets and mortgage banking; together with the adoption of the new strategy, the strategic investor changed management structures of the bank's head office; it introduced an organization system within it oriented towards individual market segments; moreover, Hypovereinsbank implemented a new information system for the management (MIS-1), a new system of controlling and principles of budgeting and managing financial risk;

- Hypovereinsbank rolled out a Call Center project in BPH; to this end, it established a specialised limited liability company Centrum Bankowości Bezpośredniej; beginning in June 2001 it started offering telephone services integrated with a bank account; the strategic investor launched the sale of bank products and services through a specialised telephone centre (Call Center) - the strategic investor budgeted PLN 13,486,720.79 for this purpose;

- Hypovereinsbank invested in the development of technical infrastructure (as a consequence of the development of distribution channels); it expanded the technical facilities of the bank's head office, server room

in particular; it expanded (central and branch) servers of the Central System and the Symetrix matrix for the Central System and purchased a tape library for its back-up - the strategic investor allotted PLN 26,604,933.23 for this purpose;

- Hypovereinsbank expanded the WAN and LAN ICT networks; it developed ICT systems and security of data sent through the network – the strategic investor allocated PLN 8,948,690.00 for this purpose;

- the development of a new type of bank branches, opened on attractive local markets (2001-2002) – as part of the approved development strategy for BPH S.A.'s branches Hypovereinsbank created 71 new ones; they were opened on the most attractive local markets, mainly in the south of the country and on the territory of the Warsaw conglomeration; in 5 cases the investor adapted the facilities infrastructure to the existing organizational structure; it opened 27 corporate offices (corporate centres); what is more, it created corporate banking macro-regions and retail banking macro-regions – they were the bank's organizational units superior to branches; Hypovereinsbank built and modernized structural cabling in branches; it also undertook expenditure for the ICT system, network devices, computer and ICT equipment;

- Hypovereinsbank installed self-service devices (cash machines and bank balance printers); it also created self-service areas in all newly opened banking centres; the objective of this process was to streamline customer service and to lower costs (for more about cost efficiency in banking system see: Tvaronavičienė et al. 2018); the strategic investor allocated PLN 22,690,444.08 for this purpose;

- Hypovereinsbank restructured the back office; it outsourced cash settlement to a separate company Międzynarodowe Centrum Gotówki Sp. z o.o.; it also recapitalized BPH's subsidiaries; they provided specialized financial services e.g. in terms of mortgage banking and leasing (2001).

In the matter of marketing and training of BPH personnel the following actions were undertaken by the strategic investor:

- the project of regionalization of BPH S.A.'s branches – 4 sales management regions were created; decentralization of decisions took place owing to this and conditions for flexible management of the network of branches were created;

- the concept of organization of specialist teams for individual customer service in branches - 3 teams were appointed in the structure of branches, specializing in mass, medium-affluent, affluent and small business customer service;

- the Consumer Finance project and the BIKE project – concerned BPH S.A.'s cooperation with Norisbank in terms of the sale of credit and retail loans;

- Hypovereinsbank's cooperation with BPH in organizing a contest for customer advisors; it involved the sale of Sez@m internet accounts along with organizing prizes for the winners (a trip to Germany);

- the customer segmentation project – held with constant participation of Hypovereinsbank AG's representative in the working party; an ABS-type segmentation project was being prepared within each customer group;

- marketing plan – Hypovereinsbank AG worked together with BPH in the matter of planning, organizing and outlining the schedule of advertising campaigns; moreover, both entities defined shared product priorities, target markets and the form of internal communication (including a retail service); in accordance with the new concept six promotional campaigns were organized;

- the concept of direction of the development of the retail product price policy - Hypovereinsbank outlined the direction for the development of this policy through: discussing the issues of assignment of price competence, basing the interest rate for retail customers on the market rate, introducing periodically adjusted interest rates for retail customers and the fees and commissions tariff;

- Insurance Cooperation Project – Hypovereinsbank introduced the sale of insurance in the BPH S.A. network and included insurance in bank products;

- small-enterprises project – Hypovereinsbank adopted a strategy for the small-enterprises segment; it focused its action on managing sales and continuation of training programmes for advisors as well as further development of electronic banking;

- Hypovereinsbank organized seminars for directors of branches in Zakopane, Szczyrk and Rytro;

Hypovereinsbank's transfer of banking technology was also significant in this aspect. It entailed working within the framework of the Integration Project. Thus, the strategic investor performed a transfer of know-how to BPH as regards:

- managing credit risk of corporate and retail banking;
- management in terms of investment banking, property financing;
- financial management;
- banking and IT technology;
- bank processes (Report, 2002).

Conclusions

Thanks to the literature review of BPH's transaction and post-transaction documentation (post-audit reports of the Supreme Audit Office) the author came to a few interesting conclusions. After purchasing shares of the aforementioned bank, Hypovereinsbank fulfilled investment obligations laid down in the purchase agreement. It did so by bringing in know-how in the form of organized training programmes, technologies, organizational methods, etc. Therefore, the foreign investor's direct contribution to the qualitative development of BPH was presented (this contribution was demonstrated in the study by cash sums spent by the investor on individual areas of operation, created branches, introduced computer programmes, etc). Summing up, the literature review of the documentation related to the share purchase transaction demonstrated a positive influence of a foreign investor in a Polish bank and thus was an example of the denial, mentioned in the beginning, of a common opinion of exploitation of local employees by foreign companies.

TOWARDS DEVELOPMENT OF TOURISM INDUSTRY: INSIGHTS INTO TOURIST NUTRITION VIA FOOD AND IMPRESSIONS

Elena V. Frolova [1], Olga V. Rogach [2], Tatyana M. Ryabova [3*]

[1,2,3] *Russian State Social University, 4 p. 1 Wilhelm PIK str., Moscow, 129226 Moscow, Russian Federation*

E-mail: 3* tani-87@inbox.ru (corresponding author)

Abstract. The article presents conclusions about the impact of food on the development of the tourism industry. It is established that gastronomy contributes to the attractiveness of local tourist products and services, increasing tourist flows. The leading method of research has become a deep relation interview with a tourist, who was attending cafes and restaurants during the journey. The results of the study illustrate the factors of choice of food outlets for social groups with different income levels; the impact of new trends in tourist food on the development of the restaurant business, which is especially important for determining the prospects for the development of the tourism industry. The authors developed a hierarchy of triggers for the formation of tourists ' impressions of food consumption in the trip: basic needs and attitudes to consumption, hospitality and interdependent relationships, impressions and emotions. Consideration of tourist food as a synthesis of food and experiences provides an increase in the competitive potential of the territory, the diversification of the local economy, the profits growth of the tourism industry. The formation of tourist satisfaction from food consumption creates the basis for re-visiting the territories, the spread of positive responses. It is established that the impression of a tourist trip may depend on the organization, completeness, exclusivity and "unusual" food consumed in the journey. The results of the study showed a relationship between high ratings of exclusivity of the dish/place of food and getting positive impressions from visiting the restaurant, as well as from the trip in General. Visualization of food and photo replication in social networks has a significant impact on the formation of positive impressions. Getting likes and approval of the reference social group is a mechanism that reinforces positive impressions. At the rational level, the Russian tourist is focused on obtaining quality goods and services. Whereas on the emotional level, the attitude to unforgettable emotions and impressions dominates. The emphasis on the practices of commercialized hospitality, attention to the successful communication of the restaurant staff and the tourist provides emotional involvement of the tourist in the process of food consumption, which forms a stable orientation of the tourist to re-visit.

Keywords: tourism industry; tourist market; tourist product; food; impressions; commercialized hospitality

1. Introduction

In modern conditions of globalization, increasing the mobility of tourists, his desire to obtain exclusive experience new points of growth of the tourism industry is such a factor as gastronomy (Lee et al, 2017.). Increasing competition in the market of tourist services requires the search for innovative approaches and new competitive advantages of the territories. In this context, it is gastronomy that has the potential to develop the tourism industry of both countries as a whole and individual territories. Understanding of tourist nutrition as a new factor in the development of the tourism industry is dictated by current trends in the models of tourist behavior: the need for authenticity, impressions, following fashion. Food on a tourist trip is an integral element of travel. Today, food is becoming increasingly important, affects the choice of tourist tour.

A number of studies have concluded that gastronomy is a tourist marker of the region. The value of food consumption has an impact on the tourist's perception of the attractiveness of the territory (Choe, Kim, 2018). Analysis of research on this topic has identified six factors that provide a positive assessment of tourists ' gastronomic experience: the strategy of attracting tourists, cooperation between stakeholders, the effectiveness of management, promotion of culinary profile, quality of service (Ottenbacher & Harrington, 2013; Shevyakova et al., 2019). Research is of interest that emphasize the importance of "dialogue" between tourists and restaurateurs as an important tool for the development of the tourism industry (Alonso & Liu, 2012).

In the context of relations of cooperation, a special role is assigned to local food, awareness of tourists about the features of national dishes (Rogach, et al., 2017). Kivela J. J. and Crotts J. C. conclude on the relationship between the experience of food consumption and the perception of culture, which creates a prerequisite for the re-return of the tourist (Kivela & Crotts, 2009). The consequence of this situation may be an active growth of tourist flows. The interest in traditional dishes is part of the overall desire for an authentic experience. "Culinary heritage" is a strategic resource for the development of the tourism industry. At the same time, it is important to update, adapt and reinterpret cultural heritage, which combines the desire for authenticity and innovation. (Bessiere, 1998).

Traditionally, gastronomy is considered as a factor of socialization of the individual (Brian, 2018), in the conditions of development of the tourism industry gastronomy becomes a source of formation of a new self-identification of the tourist, opening the "door" to a new cultural world (Urry, 2000).

The tourist's nutrition involves the whole complex of sensory sensations, ensuring the presence of a special relationship between the food and the impressions received. In particular, the emotions of the tourist from restaurant visits and food consumption play a special role in the formation of a sustainable intention to re-visit (Chen, Lin, 2018). Revealing the factors of formation of impressions from the consumption of food in the restaurant, Williams H. A., Yuan J. and Williams R. L. they identified the key ones: extreme conditions of eating, partnership between a tourist and a restaurateur, authenticity, sociability and emotions (Williams, Yuan, & Williams, 2018).

The basic component, which is of great importance when choosing a place of food consumption by a tourist, is safety. This characteristic is considered by researchers as a basis for assessing the quality and level of demand for restaurant/cafe services (Meltzer et al., 2017). Concerns about food safety and the risks of food poisoning are associated with an increase in the frequency of meals outside the home for residents of modern cities (Knight et al., 2009). Estimates of the level of safety of food consumption by a tourist during trips are determined by the significance of a number of parameters. These include: the territorial location of the feed point (the proximity to the beach, downtown, airport) (YongJin, 2019), the affiliation of the restaurant to known networks/brands (Leinwand, etc., 2017), the representation of the restaurant on the Internet, including the number of positive reviews on social networking sites (Tussyadiah, 2018), appearance of the meals (Bingham and Lavau, 2012).

The establishment of a "fair" price for food for the restaurant business is closely related to the price sensitivity of tourists (Raab et al., 2009). The price range is one of the key characteristics that affect the choice of a tourist food point during the trip. In particular, the cost factor affects the behavioural intentions, satisfaction of the tourist and his loyalty to a particular restaurant/cafe, the probability of a repeat visit (Lu & Chi, 2018). In addition, modern studies show that there is a close relationship between the socio-economic status of the tourist and his choice of food point category (Baumann et al., 2017). Also, the perception of price, the assessment of its fairness correlates with the estimates of the appearance of the restaurant/cafe (Han & Ryu, 2009). Room design/decor, decorations, spatial layout, where the tourist consumes food has an impact on consumer behaviour, the formation of the traveller's satisfaction from the trip (Rahman, 2009).

In addition to the physical aspects of the consumption space, the social aspects of the consumer environment (Matson-Barkat & Robert-Demontrond, 2018), the appearance of the staff, hospitality (Hanks & Line, 2018). In studies of Lo Y. T., Awang S. R. and Jusoh A. it is concluded that the quality and nature of the relationship between the guest and the host determine the emotional involvement of the tourist, the level of his loyalty (Lo et al., 2018). Quality of service according to a number of scientists is the only attribute that directly or indirectly affects the level of trust of tourists to the selected restaurant/cafe (Hyun, 2010).

Given the high importance of the basic characteristics that determine the choice of tourist food places (safety, fair prices, design, service), they can be considered as prerequisites for the formation of tourist impressions of food (Stone, 2017). New trends in gastronomy, which illustrate the transition from the consumption of food to the consumption of impressions, increase the importance of the emotional response of the tourist. In addition, the positive impressions of the tourist from the food reduce the possible dissatisfaction with other conditions of the organization of the trip.

Despite the considerable amount of publications on this subject, there is a lack of research that considers tourist food through the relationship of food and experiences. The development of the tourism industry requires a more detailed study of the gastronomic sector as a factor in attracting tourist flows, increasing the volume of the tourist market. Scientific publications do not sufficiently consider the impact of new trends in tourist nutrition on the development of the restaurant business; the relationship between the practices of gastronomic experience and the formation of new tourist products and offers. In addition, the factors of choice of food outlets for social groups with different income levels are insufficiently studied, which is especially important for determining the prospects for the development of the tourism industry.

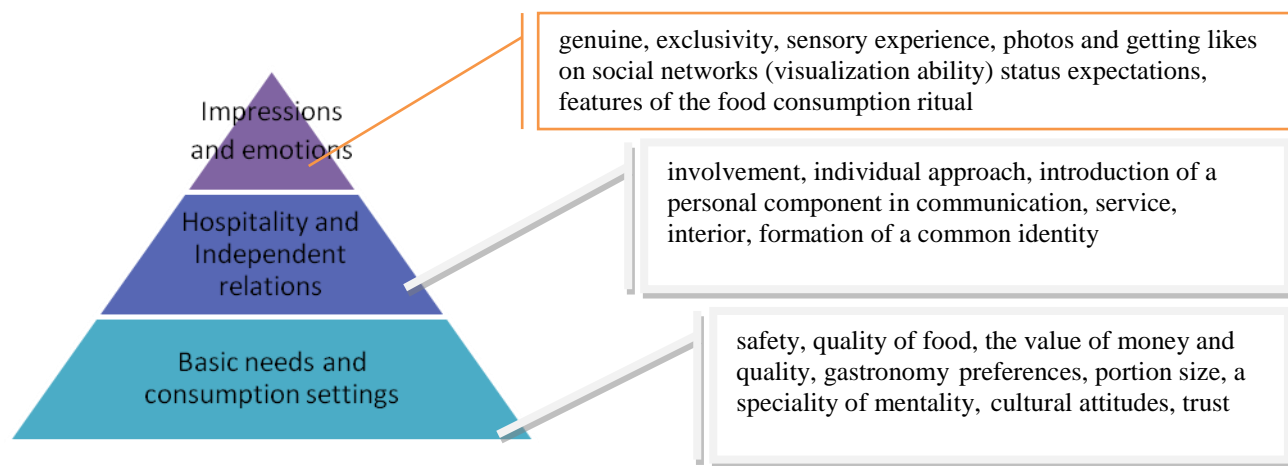
Based on the key provisions, correlations and conclusions made by leading scientists in this field, the authors developed a schematic illustration of the hierarchy of triggers for the formation of tourists' impressions of food consumption during the journey (Fig.1).


Figure 1. Pyramid of consumption: from basic values to exclusive experiences.

The formation of tourist satisfaction from food consumption creates the basis for re-visiting the territories, the spread of positive responses. These circumstances can be considered as sources of development of the tourism industry.

Analysis of scientific sources on the problem of research revealed three key blocks of formation of tourist satisfaction from food consumption. Basic needs and settings for consumption are one of the key filters for the selection of tourist places of food. Travellers, eating out of the house and the usual environment, impose increased requirements for safety, quality of food, hospitable service. The relationship that develops in the process of consumption between the tourist and the staff affect the level of confidence in the restaurant/cafe, provide emotional involvement of the tourist in the process of consumption.

These characteristics of food tourists, according to the authors, are arranged according to the hierarchy. Their structural section is formed under the influence of the social environment, socio-economic status of the tourist, cultural experience, latent or direct expectations, fashion, visualization of gastronomic experience of other tourists. The modern tourist places special requirements to the process of food consumption on a tourist trip, considering food not only as a product of saturation but as an opportunity to join another culture, gain new experience, emotions and exclusive impressions from the trip.

The purpose of the study is to study new trends in the development of the tourism industry, the interpretation of tourist food through food and experiences. The article deals with the features of the tourist's food during the trip based on the analysis of key characteristics, factors of choice of food/restaurant, to determine the correlation between the parameters of the tourist's food and the impressions received.

2. Basic needs and settings for consumption

The tourist's assessment of the gastronomic segment of the trip is traditionally based on the basic human needs for safety and satisfaction of their primary needs. The concept of security is subjective, which is formed in the process of family education, cultural familiarization with the rules of eating adopted in a separate society. From this point of view, the food in the journey can be considered as a risk factor that can significantly reduce the quality of rest. The security control is carried out by tourists in several areas: compliance with sanitary-hygienic

requirements, the credibility of the quality of the products, the vernal species of the interior, the staff, the products on display. In this context, restaurants/cafes of well-known brands /or international chains are in a more advantageous position, having a high level of consumer confidence. While individual catering outlets are forced to put more effort to win the trust of customers. The tools to increase the tourist's sense of security when visiting food outlets are positive reviews in social networks, the site of the institution, the corresponding status and the target audience of the institution.

Another component of basic needs is value for money. In several studies (Ryu & Lee, 2017), the concept of a fair price is derived, which implies a direct relationship between the quality of food and its real value. A fair price characterizes the willingness of a tourist to pay a specified cost for a particular product. At the same time, the price filter is one of the factors in the formation of the social identity of the tourist on the trip.

The orientation of some restaurateurs to maintain the price segment by reducing the size of portions has certain risks (Felten, 2012). This strategy may conflict with the behavioural expectations of tourists, focused on satiating hunger for a price. Gastronomic preferences and portion size are determined by the peculiarities of mentality, cultural attitudes, socio-economic status of the tourist.

2.1. Hospitality and interdependent relations

Ensure the involvement of tourists in the process of eating. Commercialization of guest – host relations can be supported by an individual approach to the client, bringing a personal component in communication with tourists (Moskwa, etc., 2015). Assessing the quality of service, tourists pay special attention to friendliness, attention to their needs, adequate response to emerging problems (Rogach, etc., 2017). Another important aspect is the appearance of the restaurant. The very concept of the interior can become a driver of attraction of tourists as well as the evaluation of gastronomic content. Interesting design, unusual practice of eating allows tourists to get a new experience.

2.2. Impressions and emotions

The basis for obtaining impressions can be familiarized with the national culture of food consumption (Ko, 2018). Recreation of gastronomic knowledge, exploitation of interests of tourists to traditional dishes of authentic cuisine are considered today by restaurateurs as one of the mechanisms of formation of impressions of the tourist. However, this practice is ambivalent. In particular, the presence of a single goal (attraction of tourists) can lead to a potential loss of authenticity of consumption culture, imitation of rituals, historical and national component of gastronomy (Rezaei, Naimeh, 2017).

Another factor in attracting tourists is an innovative approach to the formation of his exclusive experiences by connecting the sensory experience of food consumption. Sensory experience and nutrition are closely linked, forming a model of consumption of tourists. Emotions play a mediating role in the relationship between sensory experience and behavioural intentions (Chen & Lin, 2018).

The satisfaction of a tourist's need for consumption of gastronomic novelties can be considered as recognition of his high socioeconomic status or personal characteristics of a modern person who follows new trends (Jin et al., 2015). Food can be considered as a subject of imitation, when a tourist consciously supports a constructed "performance" aimed to "impress the audience", to acquire the social status that he would like to broadcast for his environment. The possibility of visualization of the impressions leads to the simulation of replicated images that shape other social actors latent or explicit desire for the consumption of the same experiences. "A traveller" looks at the world through the camera lens, photos in social networks and Instagram, which creates the need for consumption of dishes with a high degree of visual appeal. More and more successful restaurateurs focus on the design of the dish, its appearance and features of the ritual of eating.

Paying special attention to the features of the ritual of eating, it is worth noting the importance of scenery, artefacts (Han & Ryu, 2009), the restaurant's embeddedness in the urban and natural landscape, its positioning as an object of tourist attraction (Josiam et al., 2004). The purposeful activity of restaurateurs in the design space of food intake provides the basis for the formation of exclusive experiences, an introduction to the history and traditions of the people. The authenticity of the experience experienced by the tourist from food consumption is based on such elements as: national cuisine, local food, historical decor, ritual meal (Rahman, 2009).

Another behavioural model of the tourist-focused on the search for impressions is the desire for innovation, a new gastronomic experience, regardless of personal food preferences. Meeting the needs of tourists in new products can become a driver of tourism industry (Jin et al., 2015).

3. Material and method

As a leading method of research used in-depth interviews of tourists visiting cafes and restaurants during their travels. Interviewing of tourists was carried out in travel agencies of the city of Moscow. The number of respondents included tourists waiting for their turn to design a tourist tour. The principle of selection of respondents was the presence of travel experience, where food was not included in the cost of a tourist tour. Tourists choosing all-inclusive tours were not invited to the study. To maintain interest in interviewing, potential participants were provided with coupons participating in discount programs of the well-known network of coffee shops in Moscow. A total of 253 in-depth interviews were conducted. The process of refinement of the obtained data allowed to exclude from the study 34 questionnaires, the answers to which raised doubts about the reliability of the data.

Participants were asked to share their demographic data. The gender ratio was 39.1% for men and 60.9% for women. The study showed that the majority of respondents showed the following level of average annual family income: (A) from US $20,000 to $30,000 (50%); (C) from $30,001 to $40,000 (33%); (C) from $40,001 to $50,000 (12%); (D) more than $50,001 (5%). The average annual income in Russia per 1 persona of December 2018 was $8008, Moscow residents have a higher relative income level - $14850.
The frequency of foreign tourist trips among the respondents was: once a year – 52.2%; 2-3 times a year – 36.4%; 4 or more times a year – 11.4%.

Besides, the majority of respondents had a high educational level: bachelor's degree (29.8%), specialist's degree (55.7%), master's degree (11.3%), candidate of science/doctor of science degree (3.2%). The presented distribution corresponds to the levels of education established in the Russian Federation, where before the adoption of the Bologna Convention, the system of higher education trained specialists (5 years of study), and post-graduate education included the defence of dissertations of candidate of Sciences, and more importantly, doctors of Sciences. The transition to the new system of training predetermined the division of the speciality into bachelor's (4 years) and master's (2 years), without affecting post-graduate education.

Age distribution of survey participants represented the following proportions: (A) from 25 to 35 years (34%), (b) from 36 to 45 years (35%), (C) from 46 to 55 years (23%) and (D) older than 55 years (8%).

4. Operationalization of constructs

We developed the questionnaire based on Keller's theory, which described the generation of tourist impressions based on the brand, not the product (Keller, 2012). This made it possible to include in the evaluation scale the exclusivity of visits to certain food items and the consumption of food, creating the impression of belonging to a certain class, obtaining a higher status and approval of the reference group. Also, Keller's theory made it possible to identify as a separate parameter for assessing the emotional involvement of tourists in the process of eating.

The authors of this concept are interpreted more broadly, which allows us to interpret emotional involvement as the acquisition of the status of a tourist participant in the action of cooking, counselling, expands the boundaries of choice and provides an increase in the level of confidence in the restaurant.

Ideas of Harrington R. J., Ottenbacher M. C., A. Staggs, Powell F. A. (Harrington et al., 2011) are taken among the methodological foundations laid in the basis of our study. The works of this group of scientists reveal the attributes-drivers of positive experience of food consumption for tourists of generation Y: quality of food/drinks, quality of service, friendliness of staff, the atmosphere of the restaurant and the speed of service. At the same time, these attributes should be expanded by taking into account such aspects of consumption as the visual appeal of the restaurant/food, the ability to broadcast new experiences in the network space, the presence of "photographed places/dishes" — exotic, unique and unique objects of consumption of the tourist, causing him a special psycho-emotional state, aesthetic satisfaction from food. The need to take into account these characteristics is supported by studies conducted by Pelegrín-Borondo J., Arias -Oliva M., Olarte-Pascual C. (Pelegrín-Borondo et al., 2016). The results obtained by scientists show that the stronger the emotions of customers, the higher the satisfaction of tourists with quality, price and service.

Besides, the findings of Ryu K. and Lee J. S. formed the basis for the development of the evaluation scale. They allowed us to highlight the restaurant's performance: interior, fair price and quality of products (Ryu & Lee, 2017). We have expanded this list with questions about the evaluation of the diversity of the restaurant's product range, the level of its exclusivity, originality and taking into account national specifics. The regional specificity of consumption culture (availability of local food and beverages) forms the reinforcement of the relationship between food and desired experiences (Alonso & Liu, 2012).

Four students enrolled in the master's program "Management", conducted a preliminary interview with 20 respondents, to pre-test and adjust the questionnaire. Respondents were asked to complete the questionnaire, based on which some language was clarified.

Each evaluation question of the first block of the questionnaire assumed the use of a 10-point scale, where 1 = is not important at all and 10 = is very important (Table 1. Distribution of average values of the characteristics of the tourist food depending on the age of the Respondent and Table 2. Distribution of average values of the characteristics of the tourist's food depending on the average annual family income).

The second block of questions of the questionnaire was made to determine the frequency of selection of certain parameters of food/food points of the tourist (Table 3. Frequency of choice according to the key characteristics of tourist food). Each evaluation question involved the use of a scale with options: never, rarely, often, always difficult to answer.

The third block of the questionnaire is related to the evaluation of the food impressions received during the last trip (Table 4. Distribution of answers to the question: "Rate the impressions received from the food in the restaurant, which you visited 2 or more times during the last trip").

5. Results

Testing for Measurement Reliability and Validity

The authors give an empirical interpretation of the hierarchy of factors forming the impressions of tourists from the consumption of food in the journey. Based on the results of the study, the authors determine the average value of the characteristics of the tourist's food, according to the previously selected blocks, which are given symbols: F1 Basic needs and attitudes to consumption; F2 Hospitality; F3 Impressions and emotions (Table 1).

Table 1. Distribution of average values of characteristics of the tourist food depending on the age of the respondent

F1 Basic needs and consumption setting security	Average				
	In total	from 25 to 35 years	from 36 to 45 years	from 46 to 55 years	Older 55 years
Security	8,1	8,4	7,6	8,2	8,7
Food grade	9,1	9,3	8,8	9,1	9,3
Value for money and quality	7,9	7,5	7,6	8,5	9
Gastronomic preferences	5,9	4,6	7,3	6,9	5,1
Portion size	4,3	6,7	2,1	2,8	8,7
Trust to the point of power	5,3	7,2	3,4	5,1	6,3
F2 Hospitality					
Involvement in the process of cooking	2,8	4,7	2,1	1,4	1,3
Individual approach	6,9	5,4	8,2	6,1	9,3
The introduction of personal component in the interaction of the tourist-restaurateur	4,1	3,2	5,5	2,8	6,1
Service maintenance	7,2	7,4	7,9	6,3	5,7
Interior	6,8	6,8	7,3	6,4	6,2
Comfort	7,4	6,5	7,7	8,2	8,1
F3 Impressions and emotions					
The authenticity of (ethnic cuisine)	6,4	4,9	7,4	7,2	6,3
Exclusivity	6,2	6,1	7,3	5,6	3,7
Sensory Experience	3,5	2,4	5,1	3,5	1,3
Photos and getting likes in social networks	5,5	7,1	6,9	2,6	1
Status expectations	5,4	4,9	6,2	5,7	3,6
Features of the eating ritual	4,7	2,6	6,5	4,9	5,2

The results of the study illustrate the following pattern. In the older age group, higher estimates of the importance of such characteristics of nutrition as "safety", "portion size", "value for money" and "individual approach" were obtained. During the in-depth interview, older respondents stressed that it is important for them to feel a special, respectful attitude. Category D respondents (over 55 years) prefer to establish personal communication with the waiter, receive personal advice about the features of the dish, the specifics of its preparation. At the same time, the presence of a language barrier can be compensated by the friendliness of the staff, its readiness for communicative interaction.

In turn, category A (25-35 years) is characterized by bipolar assessments. In this category of respondents, a large proportion of families with children. This determines the importance of characteristics such as "safety", "quality of food", "value for money". Representatives of young people who travel without children are more focused on such hedonistic and status attributes as the ability to take photos and get likes on social networks, involvement in the process of cooking, interior.

The study revealed that for all categories of respondents the most important (above or equal to 7.9 points out of 10) turned out to be such basic characteristics of food, such as: the quality of the food (9.1), security (8.1) and the ratio of price and quality (7.9). The second group by significance rating (from 6 to 7.8 points) included comfort (7.4), service (7.2), individual approach (6.9), interior (6.8), authenticity (national cuisine) (6.4) and exclusivity (6.2).

For respondents of the age category (B) from 36 to 45 years, the characteristics of nutrition such as "portion size" (2.1) and "involvement in cooking" (2.1) have the least significance. At the opposite pole (values above 7.9) there

are such characteristics as: "individual approach" (8.2) and "quality of food" (8.8). The results of the in-depth interview provide a basis for understanding this choice. In particular, the respondents of the age category (B) expressed concern about the issues of healthy nutrition, the caloric content of dishes. At the same time, the individual approach is interpreted by respondents not only in the categories of hospitality but also as special attention to food habits and preferences.

Of interest is the dependence of estimates of the importance of characteristics of nutrition and income of respondents (Table 2).

Table 2. Distribution of average values of characteristics of the tourist's food depending on the average annual family income

F1 Basic needs and consumption setting security	**Average**				
	In total (N=219)	from 20,000 $ to 30,000$	from 30,001$ to 40 000$	from 40,001 $ to 50,000$	Over 50,001$
Security	8,1	8,3	8,0	7,9	7,8
Food grade	9,1	8,7	9,4	9,9	9,8
Value for money and quality	7,9	7,5	8,4	8,2	8,6
Gastronomic preferences	5,9	5,1	5,7	8,4	9,3
Portion size	4,3	4,9	4,1	3,2	2,9
Trust to the point of power	5,3	4,8	5,9	5,8	4,4
F2 Hospitality					
Involvement in the process of cooking	2,8	2,8	3,1	2,3	2,5
Individual approach	6,9	6,6	6,7	8,6	8,1
The introduction of personal component in the interaction of the tourist-restaurateur	4,1	3,7	4,8	4,0	3,5
Service maintenance	7,2	6,8	7,0	8,7	9,2
Interior	6,8	6,2	6,5	9,1	9,6
Comfort	7,4	6,7	7,5	8,9	9,4
F3 Impressions and emotions					
The authenticity of (ethnic cuisine)	6,4	6,1	6,1	7,6	7,8
Exclusivity	6,2	5,6	5,8	8,2	9,3
Sensory Experience	3,5	2,7	3,4	5,3	7,4
Photos and getting likes in social networks	5,5	5,6	5,8	4,8	3,7
Status expectations	5,4	4,1	6,2	7,8	7,5
Features of the eating ritual	4,7	3,7	5,6	6,1	6,3

High-income category of respondents (category (D), whose income is more than $50,001) attaches the greatest importance to the following characteristics of food: "exclusivity" (9.3 out of 10), "interior" (9.6), "comfort" (9.4), "service" (9.2). At the same time, low ratings (below the average values of 1.5 times) received such characteristics as: "photos and likes in social networks" and "portion size".

In the course of the study, there was a different perception of the significance of some of the characteristics of the power for the high-and low-income categories of respondents (category (A) whose income is from 20,000$ to 30,000$). The maximum gap in the estimates of respondents is noted for the following items: "gastronomic preferences" and "sensory experience".

Average estimates are typical for low-income respondents. The most important characteristics of the power supply are concentrated in the basic unit (F1 Basic needs and settings for consumption). Respondents with a low income to a lesser extent attach importance to hospitality, impressions and emotions from the power trip.

According to the results of the study, there is no relationship between the level of income and estimates of the significance of such characteristics of nutrition as "safety" and "quality of food", which took the top positions of the rating.

The gap between the assessments of significance among high-yielding and low-yielding in many ways amounts to the following values: "exclusive" 1.7 times; "authenticity, national cuisine" in 1.3 times; "sensory experience" in 2.7 times. During the in-depth interview, it was found that the respondents of a category (A) consider food on a tourist trip as a process of satisfying hunger, do not give food on the trip an additional social and cultural burden. While the expectations of high-income tourists are much higher. In particular, the process of food consumption is not limited to the satisfaction of physiological needs and is endowed with additional psycho-emotional and socio-cultural meanings for which the tourist is willing to pay value-added.

Of interest is the respondents' assessment of such characteristics of food from the F3 block "Impressions and emotions" as "photos and likes in social networks". This is the only parameter of the block, according to which the estimates of the importance of respondents of the category (A) and (B) were higher than the estimates of respondents of other categories with higher income. This can be seen as an attempt to simulate preferred social status, material well-being and success.

Analysis of the criteria for choosing a tourist cafe/restaurant or dishes allowed us to diagnose the real situation of the ratio of the needs of travellers: "food" and "impression" (see Table 3).

Table 3. Frequency of choice according to the key characteristics of the tourist food (%)

Criterion	Never	Rarely	Often	Always	Difficult to answer
F1 Basic needs and consumption settings					
I choose a cafe/restaurant in which I am confident in the safety and quality of products	8	15	36	35	6
I choose a cafe/restaurant where the price is right for me	9	14	39	32	6
I choose a cafe/restaurant that has a special menu (children's menu with special icons)	29	26	25	14	6
I choose a cafe/restaurant because I was recommended by his friends/relatives/acquaintances	9	27	40	20	4
I choose a cafe/restaurant by reviews on the Internet	14	31	36	15	4
I choose a cafe/restaurant, focusing on well-known, recognizable brands	18	33	31	13	5
I choose the dish because it is low-calorie	30	30	22	12	6
I choose only those dishes that consist of fresh and natural products (without preservatives, mayonnaise, etc.)	18	31	29	16	6
I don't care what the main thing is to have a large portion/satisfy hunger	23	31	26	14	5
F2 Hospitality					
I choose a cafe/restaurant where I am warmly welcomed, friendly service, with special attention to my needs	7	17	39	30	7
I choose a cafe/restaurant where unobtrusive communication (table for introverts)	26	27	26	14	7
I choose a cafe/restaurant because I like the design of the interior	11	30	38	15	6
I choose a cafe/restaurant in which I do not have a language barrier (clear menu, Russian-speaking staff)	14	31	29	21	5
I choose a cafe/restaurant that is easy to reach	9	25	42	19	5
I choose one restaurant for food during the trip, so that I was attentive	29	23	20	16	12

I choose a restaurant with a special family atmosphere	19	27	42	9	3
F3 Impressions and emotions					
I choose a cafe/restaurant that has been visited by famous public figures	34	29	22	10	5
I choose a restaurant with live music.	18	32	29	14	7
I choose a restaurant with entertainment	27	31	22	14	6
I choose a restaurant with a non-standard atmosphere	25	30	24	14	7
I choose a restaurant with a bright cultural flavor (authentic dishes).	13	24	30	25	8
I choose a dish because I like its name	23	31	28	13	5
I choose a dish because I like its look in the picture in the menu/showcase	11	27	37	20	5
I choose the dish because it is unusual	35	29	18	14	4
I take pictures of my food	31	29	23	13	4
I take photos of myself in the restaurant	27	28	28	12	5
I post photos from restaurants/cafes on social networks	33	28	20	15	4
Photo with food traditionally gets a lot of likes	31	23	21	12	13
In my choice I focus on cafes/restaurants, which will be highly appreciated by my friends	21	25	30	17	7

The results of the study illustrate that when choosing a restaurant, basic needs and consumption settings (block F1) prevail, as well as in the evaluation of the significance of food characteristics (Table 1 and 2). 71% of Russian tourists choose a cafe or restaurant, focusing on a reasonable price (32% "always" and 39% "often") and safety (35% "always" and 36% "often"). Also, the recommendations of friends and relatives are a significant motivator to visit a certain food point (20% "always" and 40% "often"). More than half of the respondents when choosing a restaurant are guided by reviews on the Internet (15% "always" and 36% "often").

In the journey for the Russian tourist such characteristics of food as: "low calorie meals" (30% choose the answer "never" and 30% - "rare") and "special menu" (29% choose the answer "never" and 26% - "rare") fade into the background, not being a priority indicator of the choice of food/dish.

In block F2 "Hospitality" friendly service and special attention to the needs of tourists is an important criterion of choice. 30% of respondents chose "always" and 39% - "often". Characteristics of "room design" and "transport accessibility" of the restaurant are in the upper range of estimates of Russian tourists. In particular, 53% of respondents ("often" or "always") choose a restaurant because they like the design rooms. Almost half of the respondents consider the absence of a language barrier to be an attractive feature of the restaurant. Respondents noted the following mechanisms to overcome the language barrier: clear menu (photo dishes); multilingualism (multilingualism) staff; high communicative competence and friendliness of the host.

During the in-depth interview, respondents explained their choice using the following expressions: "it's nice to feel like a guest, not a client", "calm atmosphere", "rest", "comfort". For most respondents, the characteristic of the transfer of consumer preference from the sphere of unusual/exclusive in the direction of receiving impressions of the comfort and hospitality of the restaurateurs. Respondents were particularly encouraged to describe their eating practices in the restaurants where they personally met the host, talked to him, received additional privileges or special attention. For example, "it got cold, and the owner of the restaurant brought me a warm sweater"; "knowing that I'm from Russia, as a gift I was presented with a glass of vodka; this, of course, a stereotype, but still nice special attention"; "the owner of the restaurant recognized us and sometimes treated us free dessert". Such signs of attention form a vivid impression on the tourist, a stable orientation for a second visit.

Thus, the power of the tourist as a social phenomenon fully illustrates the specifics of the consumption of impressions. On the one hand, the impression of tourists associated with visiting unusual, exclusive restaurants, getting bright emotions from new dishes. However, on the other hand, the results of the study illustrated the increasing importance of such characteristics of food tourists as hospitality, friendliness, comfort. These components of food are sufficient grounds for a tourist to get positive impressions, forming a stable orientation for a second visit. A trip to a foreign country is burdened with stressful factors (language barrier, new conditions, difficulties of orientation, etc.), so the friendliness of the restaurateur, attention to the needs of the tourist becomes doubly valuable.

Thus, the focus on the practices of commercialized hospitality can contribute to the growth of the tourism market. In modern conditions, the development of the tourism industry is based not only on infrastructure sources, but also on such parameters of a tourist trip as: friendly attitude, new emotions, authenticity, etc.
In block F3 "Impressions and emotions" respondents ' answers are presented as follows. Characteristics of food - "unusual dishes" - was significant for 1/3 of tourists (14% are always guided by this criterion, 18% - often). A little more significant for tourists there were such characteristics as: "entertainment" and "non-standard atmosphere of the restaurant."

Today is gaining popularity "foodstagram" - photographing and posting on social networks images of food. However, the results of the survey of Russian tourists show a low commitment to this trend. Russian tourists do not seek to demonstrate various aspects of food in photo and video materials. This was noted in the responses of respondents. Every third tourist never take pictures of their food, 29% - do it rarely. Reproduction of these pictures in social networks is even more rare practice. Only 15% of respondents always post photos from restaurants/cafes in social networks, 33% - never do it. Only about one in nine respondents is always focused on these practices. 13% - always take pictures of their food, 12% - take pictures of themselves in the restaurant, the same number of respondents emphasize that the photo with the food traditionally gets a lot of likes.

Thus, the unusual dishes, entertainment programs, the ability to replicate their photos on social networks do not fully provide the formation of impressions for most tourists. Many respondents are afraid to try unusual dishes (35% of respondents do not do it ever, 29% - rarely). Please note that during the in-depth interview, respondents noted the difference between unusual dishes and national dishes. The uniqueness of the dish is interpreted by the Russians as a combination of "unacceptable" ingredients in the dish. At the same time, national dishes are highly appreciated by respondents, which is connected with the formation of special trust in local traditions, the desire to immerse themselves in another culture. While the unusual dishes associated with respondents with commercialization trends, attempts to attract the attention of imaginary exclusivity. Such practices are not credible for a significant part of Russian tourists. The exception was made by representatives of the age group from 25 to 35 years, for which tasting of unusual dishes is considered as a form of extreme tourism.

Correlation analysis of the distribution
In the course of the study, respondents assessed satisfaction with the characteristics of the dish/food point during a tourist trip on a 5-point scale. In assessing the respondents were guided by the assessment of the point of nutrition, which they would like to visit again. We analyzed the relationship between the estimates of the characteristics of food and the impressions received by tourists from visiting these food points. The most interesting results were obtained in the analysis of such characteristics as exclusivity, safety, visualization, service (Table 4).

Table 4. Distribution of answers to the question: "Estimate the impressions received from the food in the restaurant, which you visited 2 or more times during the last trip" (N=219) (%).

Characteristics of the dish/food place	Received Impressions		
	Positive	Neutral	Negative
Security			
5	32,9	42,1	25,0
4	45,9	36,5	17,6
3	43,5	36,2	20,3
2	0	0	0
1	0	0	0
Value of money and quality			
5	44,3	29,5	26,2
4	54,8	23,8	21,4
3	42,0	50,7	7,2
2	20,0	45,0	35,0
1	22,2	44,4	33,3
Hospitality			
5	46,3	38,8	14,9
4	44,4	36,5	19,0
3	46,8	36,2	17,0
2	22,7	45,5	31,8
1	15,0	40,0	45,0
Exclusivity			
5	76,2	9,5	14,3
4	37,5	55,0	7,5
3	33,3	52,6	14,0
2	25,8	9,7	64,5
1	0	33,3	66,7
visualization (photo of food, interior)			
5	71,0	27,4	1,6
4	35,3	55,9	8,8
3	35,8	26,4	37,7
2	6,3	43,8	50,0
1	0	25,0	75,0
Average	**40,6**	**38,4**	**21,0**

The relationship between safety and experience is not statistically significant. At the same time, it is natural that the respondents rated" safety" not lower than 3 points. This fact indicates that the safety of food is the basic factor of the installation for a second visit, but does not guarantee it. It was found that the absence of this factor has a significant impact on the choice of food, while its presence is perceived as a mandatory attribute and does not give "added value" in terms of the formation of impressions.

The perception of price fairness ("value for money") does not have a significant impact on the formation of impressions from visiting the food point. The results of the in-depth interview showed that for the majority of respondents on a tourist trip, the price-quality ratio is not so significant, since tourists are focused on getting acquainted with new dishes and drinks, visiting iconic restaurants, etc. For Russian tourists, the cuisine is one of the important parameters when choosing a travel destination along with weather, accommodation facilities and landscape.

The lack of hospitality significantly limits the formation of positive impressions. Among the respondents who gave low estimates for this parameter (1 point out of 5), the share of those who received negative impressions is higher than the average by 24 percentage points.

During the in-depth interview, the respondents demonstrated bipolar tendencies of perception of such parameter as "hospitality". Part of the respondents, the hospitality of the restaurateurs as molestation, simulated friendliness, way more profit. Other respondents perceive hospitality as a national tradition, an opportunity to gain new cultural experience, an integral part of the local colour. Respondents gave examples of bright gastronomic impressions, linking them not so much with the quality of food, but with hospitality (in particular, the following epithets were given: "Italian passion", "southern hospitality", "festive atmosphere", "family atmosphere", etc.).

Exclusivity and visualization, as the study showed, are the most significant drivers of the formation of positive impressions from the food point. Respondents who gave a high rating (5 points out of 5) of "food exclusivity" received positive impressions from visiting the restaurant (76.2%), which is almost 2 times higher than the average. Negative impressions are demonstrated by respondents who gave low estimates of "exclusivity" (66.7%, with average values - 21%).

The following fact is of interest. Despite the low level of importance for respondents visualization of restaurant impressions, this practice is one of the leading drivers of a positive perception of the experience of visiting food outlets. In particular, 71% of those who rated the possibility of photographing food and the interior of the restaurant the highest (5 points out of 5) received positive impressions from the food in the restaurant. This is above average by 30 percentage points. Similar results were obtained in the segment of low estimates of visualization capabilities. In particular, 75% of respondents who rated the possibility of photographing food and interior on 1 point out of 5, received negative impressions from the food in the restaurant during a tourist trip. These values are 54 percentage points above average.

6. Discussion and conclusion

Theoretical and Managerial Implications
Price equity and food safety are among the basic characteristics of nutrition. Their high score is not a guarantee of bright emotions. However, in the absence of a "fair price" for tourists, it is difficult to form a positive impression of the trip as a whole.

Search for exclusivity, authenticity, today is the central motive of the journey. In search of new experiences, modern tourist is focused on visiting important places, food outlets, marked in the guidebooks, familiarity with local food. Of great importance are the methods of the theatricalization of food consumption, creative forms of participation of tourists in the creative component of gastronomy.

Under the influence of the growing demand for different types of tourist services, their diversification is taking place. In a highly competitive environment, meeting only the basic needs of the tourist cannot guarantee the development of the tourism industry. The tourism industry faces the question of finding new points of growth of tourist attractiveness. Exclusivity, visualization, uniqueness and individual approach in the gastronomic sector can be considered as a driver for the development of the tourism industry.

In contrast to this characteristic power of the tourist as "equity prices", "exclusive" determines to get high impressions. The results of the study illustrated the relationship between high estimates of the exclusivity of food/place of food and getting positive impressions from visiting the restaurant. During the in-depth interview, the respondents showed a high emotional response to such attributes of food on the trip as "unusual interior", "new combination of tastes", "non-standard presentation of traditional dishes". The feedback received differs from the respondents ' assessments in the questionnaire. "Exclusivity" received an average score of 6.6 out of 10; "features of the ritual of eating" - 4.7 out of 10. The discussion of the obtained data can be connected with contradictions in the rational and emotional aspects of the perception of food on a tourist trip. At a rational level, the Russian

tourist is focused on obtaining quality goods and services. While at the emotional level dominates the installation of unforgettable emotions and impressions.

The impression of a tourist from food can be associated not only with an exclusive, new experience but also with a special friendly attitude, increased comfort and attention to the successful communication of restaurant staff and tourists. In this case, small family restaurants can form a competitive advantage due to the cosy atmosphere, quick response to customer requests. In a tourist trip, most tourists are more or less exposed to stress about the flight, the quality of the room Fund, the change of the usual situation, etc. In this case, the comfort of the tourist food, the hospitality of restaurateurs and the friendliness of the staff reduces the level of anxiety, stabilizes the psycho-emotional state of the traveller. This fact does not reduce the importance of tourists getting new exclusive experiences, but creates a niche for small/family restaurants. The development of this segment in the restaurant business directly ensures the formation of the tourist attractiveness of the territory, creating a sustainable tourist orientation to re-visit. As the results of the study showed hospitality and friendly service are more important criteria for choosing a restaurant than the presence of entertainment, non-standard atmosphere, unusual dishes.

The results of the study allowed to determine the discussion of some characteristics of tourist food. Although the fact that photographing food is not a common practice among Russian tourists, visualization of food and photo replication in social networks has a significant impact on the formation of positive impressions. There are differences in the estimates of impressions received from visiting the restaurant in the groups of respondents who do not take pictures of food and those who took a photo and posted it on social networks. Getting likes and approval of the reference social group is a mechanism that reinforces positive impressions.

It should be noted that the results of the study, which illustrate the low prevalence of food photographing practices, raise doubts. This may be due to some distortion. In particular, for the Russian mentality, replicating photos of food and restaurant interiors are not yet a socially approved practice. This phenomenon is usually associated with the desire to show a high social status, imitation of their consumer capabilities.

Future research and limitations

The gastronomic aspect of modern tourism is becoming increasingly important. The popularization of restaurant visiting practices, the emergence of new trends in tourists ' nutrition (photo replication in social networks, giving additional socio-cultural meaning to visiting cafes/restaurants as an integral part of social status and maintaining the image) actualizes the study of gastronomy as a tourist marker of the region. The value of food consumption affects the tourist's perception of the attractiveness of the territory. The study showed the importance of such characteristics of food as "hospitality", "comfort" and "individual approach". These characteristics are centered in the segment of small family restaurants/cafes, which create additional competitive advantages.

Along with this, the positive experience of tourists is associated with the exclusivity of the meals/food points visualization features. These characteristics of food have a high degree of discussion, which is associated with differences in the rational and emotional perception of a tourist visiting a restaurant. In this regard, these characteristics of food can be considered as an additional incentive for the formation of a tourist's sustainable orientation to revisit the food point.

Tourism synthesizes all the variety of ideas, creating popular products, not only in the traditional tourist infrastructure, but also in the field of nutrition. A purposeful approach to the formation of positive impressions in the process of tourist food becomes a point of growth of the tourism industry. In particular, it provides increase of competitive potential of the territory, its gastronomic production, diversification of local economy, increase of inflow of tourists, growth of profit of the enterprises of the tourist industry.

The study showed the need for a deeper study of gastronomy and its relationship with the development of the tourism industry. Many aspects of a tourist's nutrition require detailed elaboration and clarification in order to develop new directions of gastronomic tourism development. Of interest is the transformation of models of consumer behavior of tourists depending on their income, lifestyle, professional status. This aspect of the study is of great importance for forecasting tourism demand, the formation of new tourism products, determining new trends in the development of the tourism industry.

Abstract. Corporate Social Responsibilities (CSR) and the related topics have evolved to be the major considerations in Western and developed countries. However, this concept as well as practical application is still new in developing nations and insufficient researches addressing CSR issues. This paper aims to fill the missing gap of managerial perceptions towards CSR practices and Corporate Financial Performance (CFP) by investigating the effects of managerial perception on CSR practices and the financial outcomes reported by the managers. Following the quantitative approach, the surveys were distributed to 869 managers currently working at Ho Chi Minh City and Binh Duong Province (Vietnam) based companies doing business in different sectors, with different sizes and industries. The collected data were processed through the factor analysis and SEM. As the results, managerial perceptions serve as the powerful forces for CSR implementation. Among the four remaining CSR domains, economic responsibility is the top contributor to CFP while legal, philanthropic and environmental dimensions showed minor impacts. Several implications are provided at the end to facilitate enterprises' decision making process and governments' strategy to foster the CSR adoption status domestically.

Keywords: managerial perceptions; CSR practices; CSR financial performance; Vietnam

---

1. Introduction

Globalization has urged and empowered rational individuals to actively demand higher values contributed by operating business entities. According to Barnett and Salomon (2006), investors are strictly asking companies for financial growth in addition with societal development, even though the two tasks are believed to move in opposite way. The notion of Corporate Social Responsibility (CSR) has been mentioned frequently throughout history referring and debating about the true role of corporation in essence extending merely supplying goods and services and earning profits (economic responsibilities) and complying to laws (legal responsibilities). Factors shaping the decision whether to engage in CSR activities are but not limited to internal executive incentives (Deckop et al., 2006) and external stakeholder pressures (Agle et al., 1999). Notably, determining how CSR implementation affects company's bottom lines is an unceasing effort of numerous researchers because business leaders are supposed to critically base on financial motivation to make decisions. According to the Stakeholder Theory developed by Freeman (1984), CSR engagement can help companies yield financial interests mediated by trustful and healthy relationships with the public. Du et al (2013) added that external stakeholders in turn can experience better total welfare thanks to company's strategic CSR. However, the mixed results from studies examining the connection between CSR practices and Corporate Financial Performance (CFP) occur due to differences in research methodology (Famiola and Wulansari, 2019; Margolis and Walsh, 2003; Menassa and Dagher, 2019) as well as studied context (Hofstede, 1980; Singh and Mittal, 2019) which may impact managers' attitudes towards CSR and their actions (Batool et al., 2016; Nguyen et al., 2015; Waldman et al., 2006).

Although CSR-related papers are high in quantity in Western countries, there is still a dearth of researches taking developing nation contexts (Kisenyi and Gray, 1998), especially in Vietnam. The term CSR has appeared in Vietnam since the introduction of international companies who brought along their "Code of conducts" to ensure the coherence in their strategic management. Despite the fact that this integration has gradually been observed and adopted by domestic giants, still CSR implementation is not sufficiently paid attention because 98 percent of the current companies are small and medium in size (General Statistics of Vietnam, 2019) and have limited resources (Nguyen et al., 2015). Scandalous cases relating to legal transgression, ethical standards violation or environmental destruction still occur directly and indirectly threatening the quality of life. Several previous studies about CSR in Vietnam has been found, yet the general theme has not been addressed. Studies by Tran (2017) and Thanh et al. (2018) considered CSR practices at Small and Medium Enterprises (SMEs). Other researchers investigated the link of social responsibilities performed by corporations to consumers' attitudes and behaviors (Johar and Pham, 1999). Ho and Yekini (2014) found the positive causal nexus of CSR and CFP in Vietnam through their content analysis of 60 annual reports of 20 enterprises in 3 consecutive years. This paper also aims to clarify the impacts of CSR dimensions on financial performance, however, in another approach that exploring managers' perception towards CSR and their self-evaluation of the correlated CFP. In the paper, CSR literature will be carefully reviewed to build comprehensive conceptual model and form hypotheses. Four out of five dimensions employed to cover CSR practices are directly adopted from Carroll's Pyramid of CSR including Legal, Economic, Ethical and Philanthropic dimensions and the newly added Environmental dimension helps clearer demonstrate the current circumstances in Vietnam. According to Bortree (2014), environmental awareness has become one of the most notable facets of CSR disclosure due to high level of environmental concerns. More research focus on environmental responsibility and this topic has been receiving increase attention from academics and professions (Overton, 2018; Li et al., 2020). Further, engaging in environmental CSR practices indicates positive evaluation for CSR program of companies (Wahba, 2008) and gains good brand image (Planken et al., 2013). More importantly, environmental CSR implementation addresses stakeholder concerns for environmental challenges (Welford et al., 2008). Not only the government but also primary stakeholders have pressure on companies' activities related to protecting natural environment (Martínez García de Leaniz et al., 2019). Thus, companies in developing or developed countries cannot deny the visibility and importance of environmental CSR practices in their business performance. However, studies of relationship between

environmental CSR practices and financial outcomes provide inconclusive results (Ambec and Lanoie, 2008). Research is needed to understand effects of environmental CSR practices on business performance in different contexts. Acknowledging the importance of environmental CSR practice, the researchers aimed to add this dimension to research model for testing its effects in the particular context of Vietnam economy. Throughout the research, the following objectives will be completed: (1) to demonstrate the managers' perception towards CSR in Ho Chi Minh City and Binh Duong Province; (2) to review the related literature body about CSR practices and CFP; (3) to provide a framework addressing CSR practices and CFP in managerial perspective; (4) to discover the link between each dimensions of CSR practices on CFP; (5) to give recommendations to conduct effective CSR activities and gain financial success.

2. Literature review

The emergence of CSR has been traced back to the 1950s when dozens of theoretical and practical debates about the most comprehensive CSR definition were found. Bowen and Johnson (1953) defines CSR as the obligations, decisions and actions of businessmen that bring values to the society rather than company's short term profits. Discussions about the pros and cons as well as applications of CSR have also been addressed widely in huge number of researches with different approaches and methodologies, each with its own limitations. To depict a holistic view of CSR and specify what types of responsibility firms have to performed, Carroll (1991) came up with "the most well-known model of CSR" or the so-called "four-part definitional framework for CSR" incorporating four conceptually independent domains arranged on a pyramid. Each dimension will be reviewed and discussed later. In addition to Carroll (1991) model, Dahlsrud (2008) in his content analysis of 37 definitions of CSR attempted to draw the common patterns and categorize CSR into five explicit dimensions that are voluntariness, stakeholder, social, environmental and economic by using frequency counts. This research is going to adopt five components of CSR in which four are retrieved from Carroll's Pyramid of CSR and one additional environmental dimension from Dahlsrud (2008). Thus, it is generally understood that CSR aims to gain financial success in the manner of ethical virtue, respect involved stakeholders and environment as a whole. Besides, although different perceptions and subjects such as corporate social performance (CSP), business ethics and corporate citizenships are reviewing substantially, the CSR concept is still considered as the mainstay and employed extensively in modern businesses.

A number of researches circumscribing CSR topic have raised few questions about the managerial role in initiating and organizing socially responsible actions (Wood, 1991), despite the fact that top managers were supposed to take crucial roles regarding to this field (Quazi, 2003). In detail, (Waldman et al., 2006) and Wood (1991) argued that it is socially responsible manager inducing the whole corporation to be socially responsible. The decision made by this type of manager seemed to be toughing since the balance of corporate objectives as well as internal stakeholders' interests and social responsibilities forces the leader to weigh, deliberate and harmonically integrate to the business with the established strategy (Marta et al., 2008). At the very first phase of the process, managers need to sense the signals transmitted from the external environment (Hegarty and Tihanyi, 1999) before contemplating on the set of responses (Child, 1972). This is when individual perception joins in to orchestrate the process as it is referred to the energetic emotional manner liable for appearing to, consolidating, and inferring sensory data (Buchanan and Huczynski, 1997). Building on this definition, Álvarez and Merino (2008) defined managerial perceptions as "the substratum" closely linking to managers' personal characteristics and serving as the foundation for determine the best alternative. Furthermore, managers' attitudes, knowledge and judgement are said to be moulded by their mental models built from personal unique values, beliefs, education, demography, backgrounds and cognitive predisposition (Harrisson and Boyle, 2006; Hill and Levenhagen, 1995; Rokeach, 1973; Menon and Menon, 1997; Senge and Sterman, 1992; Thomas and Simerly, 1994) which possibly suffers from inevitable human errors, biases and imperfection. For instance, Burton and Hegarty (1999) research revealed that women are more likely to engage to CSR orientation. Campbell (1999) presented that the more risk-

avoidance tendency of the managers, the less opportunity they advance enviropreneurial marketing strategies. Thus, no manager can totally visualize and interpret the complicated business world in general and organizational system in particular (Simon, 1957). Yet, the better the upper echelon understands the environment, the better the organization performs (Downey et al., 1975; Hegarty and Tihanyi, 1999). By contrast, irrelevant interpretations of the environment can lead to catastrophic consequences (Milliken and Lant, 1990). Further researches also proved that top executives exert their power to launch and lead organization's CSR orientation as they oversee and guide the business to sustainable success (Banerjee, 2001; Waldman et al., 2006). Thomas and Simerly (1994) acknowledged that managers' perceptions play decisive role in disclosing the so-called "strategic posture" of the business describing decision makers' approach towards social demands. Ullmann (1985) stated that an active strategic posture nurtured by leader who attempts to gratify the majority of stakeholders by social responsibility exercises highly urges business to perform actual practices and disclosures. Peterson and Jun (2009) developed "the practitioner-based model of societal responsibilities" to come up with the model of managers' perspective in relation to societal responsibility. In spite of acquiring the inconsistent answers due to individual differences, the findings display the popular traditional or narrow view of managers towards CSR that instead of concerning the destiny of the world, most managers focus on responsibilities directly relating to the operations. In 2002, PricewaterhouseCoopers (PwC) surveyed 1200 CEOs from 33 countries to probe their perspective towards CSR. 70% of the participants admitted the vital role of CSR to their business no matter what economic stage they were in. In the 17th Annual Global CEO Survey (2017), PwC expanded the scope to 1344 CEOs in 68 countries to investigate their attitude towards CSR and Sustainability. Viewpoints about megatrends were classified into five groups: technological advances, demographic shifts, global economic power shift, resource scarcity and climate change, and urbanisation. The responses to the presented issues and challenges manifested managers' sustainable-oriented mind-set. As exhibited in the report, among all CEOs, 76% of them conceived that it is important to fulfil societal needs and assure well-being of the descendants (PwC 17th Annual Global CEO Survey) and 69% believed that business should balance all stakeholders' interests as it truly functions for. Recognizing the necessity of CSR, a lot of companies invent the titles such as "Corporate Responsibility Officer", "Vice President/Director of CSR", "Chief Compliance Officer", "Chief Ethics Officer" and "Investor Relations Officer" (Marshall and Heffes, 2007) to handle CSR affairs. In developing countries, personal values of managers are also described as the top internal pressure impelling corporate CSR engagement (Fernando and Lawrence, 2014). To sum up, managers' perceptions play the influential role in creating organization's awareness of CSR and cascading it to the lower level managers (Bedeian, 2002). Then, the way organization counters those issues closely connects to its singular features and culture (Bowen and Heath, 2005).

H1: Managerial perception is positively related to CSR practices
    H1-1: Manager's perception is positively related to Economic CSR
    H1-2: Manager's perception is positively related to Legal CSR
    H1-3: Manager's perception is positively related to Ethical CSR
    H1-4: Manager's perception is positively related to Philanthropic CSR
    H1-5: Manager's perception is positively related to Environmental CSR
H2: Managerial perception is positively related to Corporate financial performance

According to Carroll (1991), economic dimension refers to the fundamental role of corporations that is to generate revenue and profit to sustain and develop their business by providing goods and services. This dimension may seem unusual at first because it does not clearly demonstrate the business's contribution to the society. However, profits are urgent topics since not only shareholders and board of management are directly incentivized by financial returns but external stakeholders can also expect the values creation that benefits them while businesses strive to achieve financial objectives. Moreover, resource shortage can possibly hinder CSR performing motivation.

H3-1: Economic CSR is positively related to corporate financial performance.

Carroll (1991) also defines legal dimension as the company complying with laws whilst chasing to accomplish company's mission and vision. Companies that proactively follow different types of laws such as labor, taxation, business laws are regarded as performing legal responsibilities. Once companies decide to fulfill the dictated regulations, they need to incur the so-called compliance cost. On the contrary, companies might face the cost of non-compliance such as litigation, compensation and fines and other immeasurable costs in case they fail to obey laws. Comparing the cost of compliance and cost of non-compliance is a critical action although these two types of cost often vary across nations and industry which can lead to a certain tendency towards laws conformity. Based on the final results disclosed by Ponemon Institute and Global Scape Security Company, the costs of non-compliance are approximately 2.7 times as much as the costs companies must pay to adapt to regulations. By and large, besides explicit costs companies will unfortunately confront since violating legal requirements, there are incalculable losses they are subjected to listed as brand ruin, customers' distrust and other opportunity costs that takes them abiding years to completely recover.

H3-2: Legal CSR is positively related to corporate financial performance.

According to Irshad et al. (2007), this ethical CSR dimension refers to controlling social mores including moral standards, guidelines, values and desires of the society such as fair and just behavior for an operating business. The ethical responsibility differs from legal responsibility as the latter cannot fully encompass the multi-facets of ethics and morals (Solomon, 1994) and companies virtually need to auto-adjust themselves to the standards set by the society rather than the laws solely. Indeed, government regulations and laws derived from the urge from the society to clearly stipulate which action is right and which one is unacceptable in a particular culture and thus, is the subset of ethical responsibilities. Ethical CSR are apparently exhibited through company's respects to the stakeholder by operating with integrity, voluntary fair protection as well as human rights reverence.

H3-3: Ethical CSR is positively related to corporate financial performance.

Philanthropic responsibility – also denoted as Discretionary responsibility comprises entire types of voluntary corporate giving such as resources donation, fundraisings and other altruistic activities. As shown by the name, companies can decide whether to engage in philanthropic responsibilities without being judged and criticized by the populace (Jamali and Mirshak, 2006). However, a company satisfying this highest expectation of the society is promised to experience positive values due to being recognized as a good corporate citizen that reciprocates a portion of corporate wealth to the society which provides necessary conditions for them to thrive (Bowie, 1995). Despite that trade-off effect can happen as the expenses for philanthropy may strain company's bottom line (McWilliams and Siegel, 1995), still there are researchers such as Brammer and Millington (2008) proving that effective philanthropic CSR boosts CFP thanks to positive brand image and supports received from government, suppliers, employees and customers.

H3-4: Philanthropic CSR is positively related to corporate financial performance.

The environmental dimension of CSR practices is newly added as an independent dimension by this paper based on Dahlsrud (2008) content analysis of CSR definitions. The reason for this adoption comes from the substantial awareness and attention to environmental element from global consumers in the era of the Fourth Industrial Revolution and companies transforming to green businesses can reinforce their competitive advantages (Yusoff et al., 2015). According to Wang (2011), environmental CSR shows the endeavors and commitments from the company to preserve the natural resources as well as to protect the ecosystem during manufacturing products and delivering goods and services. The relationship between Environmental CSR and CFP has been

addressed frequently by the literature. Russo and Fouts (1997) supported the progressive nexus of environmental responsibilities and financial performance by arguing that environmental friendly companies generate favorable feelings from consumers, avoid potential risks from being fined by the government and save resources for sustainable development.

H3-5: Environmental CSR is positively related to corporate financial performance.

Based on discussed literature review, previous theoretical framework and empirical studies, a conceptual model for this study was proposed. The main constructs in the model are manager's perception towards CSR, economic CSR, legal CSR, ethical CSR, philanthropic CSR, environmental CSR and Corporate Financial Performance (CFP). Figure 1 demonstrates the assumed underlying relationships, which was built based on strong foundation of theories.
Figure 1. Proposed conceptual framework.

3. Methodology and data

Quantitative method will be used to ensure the objectiveness of collected data after statistically, mathematically and numerically analyzing. Also, in case of mapping the relations of among constructs, quantitative method is perfectly applicable. Managers working in different industry in two major locations of Vietnam – Ho Chi Minh City and Binh Duong were randomly surveyed. However, the sample will first be stratified into three major groups according to type of company they are coming from: Public, Private and FDI. CFP was constructed using a 3-item, 5-point Likert scale varied from 1 (strongly disagree) to 5 (strongly agree) in which 6 items were generated to measure managers' perceptions, 7 items to weight economic CSR, 5 items to quantify legal CRS, 5 items to measure ethical CSR, 5 items to measure philanthropic CSR, 7 items to measure environmental CSR and 3 items to measure CFP. Each item is an attitude measuring statement probing how managers evaluate the degree of CSR participation as well as financial performance in three latest fiscal years by themselves. The measurement scale was designed based on distinctive sources for each constructs and combined together. CFP was primarily measured by sales, return on equity (ROE) and return on assets (ROA) described by managers' level of agreement. The initial questionnaire was firstly composed in English and then converted into Vietnamese for use.

A total of 869 valid answers were received after distributing the questionnaire to the target sample. Online questionnaires were sent to the Departments of Planning and Investment of two selected cities for distribution to targeted managers. Furthermore, printed surveys were also spread to accessible managers in nearby companies in Ho Chi Minh City. Then, face and content validity using SPSS was executed to ensure reliability measuring scale from 38 to 33 items, 5 items of ethical CSR were eliminated due to low factor loadings before establishing SEM using AMOS. In details, before conducting EFA to identify the latent factors, the reliability test for each individual construct was employed. Cronbach's Alphas were restated again after the authors ended up with the underlying factors. Next, the Confirmatory Factor Analysis (CFA) – a multivariate statistical procedure was executed to test how well latent variables in the prerequisite stage represent the constructs. After CFA, firm evidence will be provided to reinforce hypotheses testing results. This study adopted principal component analysis (PCA) as the method for SEM analysis. According to Diamantopoulos et al. (2000), model fit is evaluated by the series of indices: Chi-square / Degree of Freedom (CMIN/df), p-value, Root Mean Square Residual (RMR), Comparative Fit Index (CFI), Goodness of Fit Index (GFI), Tucker and Lewis Index (TLI), Root Mean Square Error of Approximation (RMSEA) and Akaike Information Criterion (AIC) which are well suited for Structural Equation Modeling (SEM).

4. Results and discussions

Results from descriptive statistics revealed that the sample is greatly diverse as surveyed managers came from companies in different business sectors, types, sizes with different annual revenue and positions. As shown in Table 1, the representatives from Ho Chi Minh City based companies (62.37%) outnumbered ones from Binh Duong Province (37.63%). Most respondents are Deputy Managers (25.20%) and only a few of them are Chief Accountant (6.67%). More than half of the sample is currently working in Private business sector (59.26%) and this is also the case for business size which the size of 10 to 200 employees made up 58.92% of the three classifications. Almost half of the sample (43.27%) fell into business type of "Trade and Services"; the other "Real Estate" and "Manufacturing" respectively account for 17.03% and 39.70%. In terms of annual revenue, the highest percentage of respondents 38.67% shared that their companies earn from 11 to 50 billion VND, while 25.09% is for "50 – 200 billion VND", 18.30% for "1 to 10 billion VND" and 17.95% for "200 billion VND and above" listed in descending order. Because the sample demography somehow captures the business environment here in the two typical commercial areas in the South that are considered to be pioneers in CSR adoption, it is endorsed by the authors to realistically reflect the overall characteristics of business in Vietnam.

As mentioned previously, an EFA with the calibrated sample of 869 using PCA approach with Varimax method of rotation was employed to diminish the number of initial observed variables and find the latent components. The number of extracted factors is determined by the the number of eigen-values exceeding 1.0. Moreover, in case the factor loadings of an item happened to be less than 0.4 (Hair et al., 1998) or cross-loadings appeared to be greater than 0.3 (Jabnoun and Al-Tamimi, 2003) between two arbitrary items, the item(s) were eliminated. Table 3 presents a four-CSR factor underlying structure labeled as Environmental CSR, Legal CSR, Economic CSR and Philanthropic CSR which together explained 51.976% of the total variance was obtained after two rounds of examination and item removal. Besides the whole Ethical CSR pillar was deleted, EcoCSR5 and EcoCSR7 were also excluded as not passing the predetermined constraints. The Cronbach's Alpha was run again for the Economic CSR dimension (0.737) and satisfied the lower limit of 0.70 (Hair et al., 2010). The authors conclude that the overall scale and the four extracted factors are validated to be reliable. The final KMO of 0.944 after dropping 7 items was recognized as "Marvelous" and the p-value from Bartlett's test of sphericity (0.000) lower than 0.05 or 5% confirm that the results of factor analysis were useful.

Subsequently, a CFA was employed on the validated sample of 869 to test whether the CFA model and the data structure are acceptably fit with each other. The fit indices of the measurement model are demonstrated and evaluated in Table 1.

The results from Table 4 verified that the measurement model was fitted to all indices ($\chi2$= 2.475, df = 203, p = .000, GFI = .947, TLI = .945, CFI = .951, RMSEA = .041). Also, there are no distinguishing differences between CFA (SFL) and EFA loadings, indicating that the structure of CSR practices after the EFA was generally validated in the CFA.

Table 1. Summary of factor analysis and feasibility analysis

Factor and measured items	EFA (n=869)	CFA (n=869)		
	Loading	SFL	SMC	Composite Reliability
Environmental CSR (Cronbach's Alpha = .837)				
EnCSR4: Use of eco-friendly materials	.707	.673	.452	
EnCSR6: Minimize and recycle wastes	.675	.672	.451	
EnCSR5: Reduce energy consumption	.668	.665	.443	
EnCSR3: Avoid pollution	.645	.633	.401	.838
EnCSR7: Environmental label of products	.619	.664	.441	
EnCSR1: Programs of minimizing negative impacts	.595	.628	.395	
EnCSR2: Protect and improve natural environment	.595	.629	.395	
Legal CSR (Cronbach's Alpha = .789)				
LeCSR4: Currently issued laws	.739	.621	.386	
LeCSR2: Legal regulations	.716	.700	.489	
LeCSR1: Paying taxes	.630	.644	.415	.754
LeCSR5: Respects of agreement	.620	.668	.447	
LeCSR3: Legal standards of products	.603	.639	.408	
Economic CSR (Cronbach's Alpha = .737)				
EcCSR1: Profitability	.738	.550	.302	
EcCSR4: Benefits for employees	.587	.678	.459	
EcCSR3: Productivity	.550	.623	.389	. 740
EcCSR2: Creating jobs	.483	.575	.331	
EcCSR6: Customer satisfaction	.458	.580	.336	
Philanthropic CSR (Cronbach's Alpha = .751)				
PhiCSR2: Collaboration with local businesses	.711	.577	.333	
PhiCSR5: Dedication to society development	.662	.642	.412	
PhiCSR4: Support community	.649	.632	.400	.752
PhiCSR3: Charities	.524	.641	.411	
PhiCSR1: Support education	.508	.579	.336	
	KMO = .944, Bartlett's test of sphericity: $\chi2$ = 6333.909, p < .000	$\chi2$ = 2.475, df = 203, p = .000; GFI = .947, TLI = .945, CFI = .951, RMSEA = .041,		

Note: EFA = Exploratory Factor Analysis; CFA = Confirmatory Factor Analysis; SFL = Standardized Factor Loading; SMC = Squared Multiple Correlation; KMO = Kaiser-Meyer-Olkin Measure of Sampling Adequacy; RMSEA = Root Mean Square Error of Approximation; GFI = Goodness of Fit Index; TLI = Tucker-Lewis Index; CFI = Comparative Fit Index

Six items of managerial perception variables and three items of CFP were run with another EFA with the same calibrated sample size of 869. As the expectations, two independent factors were extracted which explained for 55.624% of the initial observed variables. Only one round was run and no items violated that presets (See Table 2). The Cronbach's Alphas all passed the limit of 0.6 as suggested by Diamantopoulos et al. (2000), showing a strong degree of reliability. Again, KMO and p-values from Bartlett's test of sphericity confirm the usefulness of results retrieved from factor analysis.

Moreover, Table 2 indicates that the measurement model of Managerial Perception and CFP fit the data well by comparing the extracted indices with the thresholds.

Table 2. Factor Analyses of Managerial Perceptions and CFP

Factor and measured items	EFA (n=869)	CFA (n=869)		
	Loading	SFL	SMC	Composite Reliability
Managerial Perception (Cronbach's Alpha = .808)				
Percep5: Access to bank loans	.714	.615	.378	.801
Percep3: Long term profitability	.687	.710	.505	
Percep2: Relationship with the government	.659	.652	.424	
Percep1: Company image	.607	.577	.333	
Percep6: Avoid additional regulations	.606	.590	.348	
Percep4: Industry-labor relation	.505	.657	.431	
Corporate Financial Performance (Cronbach's Alpha = .706)				
FP2: Return on sales	.816	.694	.482	.707
FP1: Return on equity	.617	.638	.407	
FP3: Return on assets	.566	.671	.451	
	KMO = .855, Bartlett's test of sphericity: $\chi2$ = 2145.360, p < .000	$\chi2$ = 3.395, df = 25, p = .000; GFI = .978, TLI = .959, CFI = .972, RMSEA =.053,		

In addition, the Chi-Square decreasing from 138.020 to 84.876 exhibited in Table 2 was the result obtained after taking the cross-loading of Percept5 and Percept6 basing on their highest modification indices (Nyaupane et al., 2004). It can be reasonably rationalize that a socially responsible company believed to less suffer from harsh governmental regulations can coincidently attain better credits to financial institutions. Apart from the decrease in Chi-Square, the model fit indices all significantly improved and the loadings from the CFA emphasize the significance of the model at the 0.05 level after EFA.

After proving that the measurement model was acceptable, it is essential to establish the structural equation model (SEM) with the sample size of 869. The factors' scores were computed by taking the mean of each factor. The structural model is presented in Figure 2 below.
Figure 2. Modified Structural Model with Estimated Path Coefficient

According to the path coefficients shown in Figure 2, managerial perceptions toward CSR practices had significantly positive association with all four CSR dimensions comprising legal, economic, philanthropic and environmental responsibilities which then formed positive influences on CFP. Thus, hypothesis 1 (H1-1, H1-2, H1-3, H1-4; H1-5) and hypothesis 2were supported. Additionally, the direct relationship between Managerial Perceptions and CFP was also portrayed with the coefficient of 0.4 confirming that the secondary hypothesis 3 was also accepted. Based on the results from the connection among constructs, the authors can conclude that managerial perceptions towards CSR practices had positively indirect relationship with CFP through promoting the implementation of CSR in the four categories. In other words, once managers are clearly aware of the benefits receiving from CSR engagement, they are more willing to actually execute CSR activities and gain better financial performance in terms of ROA, ROE and Sales increase (See Table 3).

Table 3. Hypothesis Testing Results

	Path	Direct Effect - St. Estimate (β)	S.E	C.R.	P	Result
H1-1	MANPER → ECSR	.533	.018	18.548	***	Supported
H1-2	MANPER → LECSR	.542	.018	19.015	***	Supported
H1-4	MANPER → PHICSR	.602	.017	22.208	***	Supported
H1-5	MANPER → ENCSR	.538	.018	18.781	***	Supported
H2	MANPER → COFIPER	.403	.037	10.173	***	Supported
H3-1	ECSR → COFIPER	.292	.043	10.388	***	Supported
H3-2	LECSR → COFIPER	.072	.043	2.554	.011*	Supported
H3-4	PHICSR → COFIPER	.060	.046	2.008	.045*	Supported
H3-5	ENCSR → COFIPER	.057	.043	2.027	.043*	Supported

Squared Multiple Correlation (SMC) of the endogenous variable denoted as R^2 ranging from 0 to 1 indicates the effects that the latent variables have on the outcome variables in terms of percentage of variance caused. According to Borenstein and Cohen (1998), the R square value higher than 0.25 meaning the R value equals to

0.50 signifies the large effects in behavioral sciences. In this paper, the R^2 value of Corporate Financial Performance variable was 0.51 meaning that 51% of the total variance in CFP was explained by the structural relations in the official model.

This study's objectives were to establish and empirically test the SEM to explore how managers in Vietnam self-evaluate their companies' financial performance in terms of ROA, ROE and Sales growth with the certain level of CSR awareness and a set of important CSR practices. In the context of managers working diverse businesses operating in Ho Chi Minh City and Binh Duong Province, Vietnam, CSR practices were categorized into four underlying factors, Economic, Legal, Philanthropic and Environmental Corporate Social Responsibilities. The measurement scales were built from multiple researches containing the reliable items for measuring the proposed constructs. As the results, the final structural relation model disclosed the direct causal linkages between Managerial Perceptions and CSR Practices, CSR Practices and CFP and Managerial Perceptions and CFP. Besides, the Managerial Perceptions indirectly influenced the CFP variable through mediating CSR Practices Variables.

The Managerial Perceptions were different for the four identified dimensions of CSR practices which then had different effects on CFP. Although there are a large number of studies about CSR-CFP relationship previously, not many of them have been found to employ the similar constructs and the methodologies, thus the findings would not be equivalently compared. Famiola and Wulansari (2019), Fombrun and Gardberg (2000) and Ullmann (1985) mentioned the essential roles of mediating variables between CSR practices and CFP rather than supported their direct relationship. The research results even contradict the Managerial Opportunism Hypothesis developed by Preston and O'Bannon (1997) that postulated the negative relationship between CSR and CFP, however, partly confirm Menassa and Dagher (2019), Waddock and Graves (1997) that CSR and CFP mutually reinforce each other through a so-called virtuous circle hypothesis. On top of that, this paper advocated the Good Management Theory which posited that good adoption of CSR domains could possibly lead employee's productivity, corporate reputation, customers' satisfaction all of which cascade to financial growth. As the most salient factor explaining the variability of CFP, the economic responsibilities have been deliberated when ones raised a question about the causality. This point was hypothesized under the "Slack Resource Theory", arguing that social performance domains resulted from the availability of slack resources or companies would have more freedom to execute CSR activities once they perform great financially, in other words. Thus, this dimension is rational in this case. Further, the positive relationships between philanthropic CSR and CFP and between environmental CSR and CFP were supported by Seifert et al (2003) and Mengue et al (2005) respectively even though the CSR and CFP measures were not exactly the same. However, there are still opponents refuting these positive linkages who believed that the costs of implementation will hold companies from attaining their financial objectives. On the other hand, the results showed that managers with certain level of understandings of CSR benefits generally engage in CSR practices, which is in line with the Theory of Planned Behavior developed by Ajzen (1991) stating that an individual's behaviors are shaped by the intention toward behavior, beliefs and attitudes. Plus, Waldman et al (2006) in their study asserted that leaders truly play a crucial role in adopting and practicing CSR in their organization.

By and large, all proposed hypotheses were accepted, demonstrating that the surveyed managers perceived, implemented and assessed the payoffs from CSR practices in a positive manner. Nonetheless, while three dimensions that are legal, philanthropic and environmental responsibilities (Martínez García de Leaniz et al., 2019) subtly shadow the effects on CFP, economically orientation is the strongest contributive factors determining the improvement in CFP. The reason mostly comes from the particular business environment in Vietnam currently that micro and small enterprises whose priorities are profits, productivity and efficiency make up more than 96% of the total registered enterprises in Vietnam (GSO, 2019). In addition, as the results shown

from Van and Chan (2008), surveyed companies claimed that CSR implementation is a challenging and costly task and Thang (2008) survey of management students revealed the little knowledge about the term CSR itself. Despite that over a decade has passed since their studies and optimistic signals were noticed through this research, still managers need more time to precisely discover and gauge the payoffs from legal, environmental and philanthropic CSR.

5. Conclusions

After the discussion of the research results, the authors came up with several suggestions for enterprises and Vietnam government to promote CSR potential benefits.

For the enterprises, making efforts to boost the economic growth should be put at top priority, outshining other types of responsibilities. In other sense, companies need a meticulous and sustainable strategy for organization development. Many approaches that companies can consider to perform their economic responsibilities comprising but not limiting to profits maximization through productivity increase, marketing and sales effectiveness and product and process improvement, business expansion generating more jobs for labors and innovation for the community. Vietnam economy is growing at the fast pace with opened economic policy allowing enterprises to easily adopt and transfer new technologies, run experiments and gaining credits, especially for startups. Thus, companies' most challenging conundrum is to decide how to utilize their own resources, to invest in which assets to yield back the most before deciding which proportion of the profits should return to the society as reciprocation through philanthropic activities. Moreover, the modest positive influences of legal, philanthropic and environmental CSR domains imply that companies need more time and further attempts to practically embed these responsibilities into their corporate strategy. It also requires companies' unceasing efforts to downplay the costs along the way to achieve positive net present value. The role of a leader is strongly emphasized in this paper. To gain higher CFP in terms of ROA, ROE and sales volume, shareholders of a company need to nominate a leader having a strategic vision about CSR and drive the whole corporate to effectively and efficiently exercise CSR practices.

For the government, the critical mission is to aid companies by improving the fairness and transparency in the business environment which equipped companies with adequate conditions to achieve their financial objectives. Plus, Vietnam government needs to strive to cut the cost of legal compliance, especially under the realm of administrative procedure compliance that brings higher optimism to the companies' perception about legal compliance costs and motivation to proactively acting in accordance with laws. Furthermore, government should highlight the role of not only individual citizens but also enterprises in the common efforts of protecting and reforming the environment. By promulgating stricter environmental decrees as well as giving prominence to environment-related initiatives from pioneering enterprises, other following enterprises will have more confidence and inspiration to trigger CSR exercises.

6. Limitations and future research

The research is subjected to inevitable shortcomings with the research design and methodology explained as follows. Because the data were collected from managers working in Ho Chi Minh City and Binh Duong Province, Vietnam, research results may not reflect the general cases and be applied to other areas as well as in other developing countries. Moreover, as the sample has great diversity, this study is not centralized around a specific business sector, size, revenue, industry or manager's position. Hence, the effects of CSR practices on CFP might vary as ones trying to look into a narrower scope.

The paper also faces another problem with the methodology. As surveyed managers gave their answers to the questionnaire completely based on their attitudes and subjective evaluations, a scenario can happen when two or more managers in the same companies see different facts from one fact. It may distort the honesty and objectivity of the company's reality. In spite of the fact that the study successfully demonstrated CSR consideration under managers' prism, it did not answer why managers have such evaluations.

In final words, this study attempted to explain and predict how CFP is impacted by a structural model including managerial perceptions, economic CSR, legal CSR, philanthropic CSR and environmental CSR. In future research, more detailed CSR categories and other control and moderating variables should be integrated to the model to achieve more in-depth knowledge of the CSR-CFP link.

Abstract. There is little evidence of the role of resources and capabilities related to information systems and technologies (IS/IT) in the adoption of proactive environmental practices in firms. The purpose of this study is to explore the influence of organisational and IS/IT resources and capabilities on the adoption of proactive environmental practices as well as the ultimate effect on environmental performance. By conducting covriance-based structural equation modelling (CB-SEM) to a multi-sample of 129 small, medium and large firms operating in different industrial sectors in Bogotá, Colombia, we found that organisational and IS/IT resources shape the development of capabilities for continuous improvement, stakeholder management, IS/IT support to general functional activities and IS/IT support to environmental management. Further, firm capabilities lead to the adoption of proactive environmental practices, which in turn, determine improvements in environmental performance. Findings support the relevance of IS/IT resources and capabilities in driving pro-environmental behaviour in firms.

Keywords: Proactive environmental practices; environmental performance; information systems and technologies (IS/IT); resource-based view of the firm (RBV)

1. Introduction

Over the past years, there has been an increasing concern for the social responsibility of firms (Arribas, Espinós-Vañó, García, & Oliver, 2019). As part of such social responsibility, particularly, attention has been paid to the preservation of the natural environmental, which demand actions from the business sector by means of rethinking their investments, strategies and operations (García et al., 2019; González-Bueno & Nuñez Rodríguez, 2018).

This implies the acquisition and development of organisational attributes strategically used in order to drive response. In this sense, the specific characteristics that influence environmental performance of an individual firm have been a matter of concern in academic studies. That is, the strategic attributes which can be managed consciously by the organisation's leadership in order to achieve superior environmental performance (Etzion, 2007).

Literature subscribed to the Resource-Based View of the firm (RBV, Barney, 1991; Grant, 1991; Wernerfelt, 1984), and the Natural Resource-Based View of the firm (NRBV, Hart, 1995; Hart & Dowell, 2011) as an extension to the natural environment, has argued for the relevance of valuable and unique resources and capabilities as drivers of corporate response to environmental concerns that have been widely approached empirically (Aragón-Correa et al., 2008; Leonidou et al., 2017; Prieto-Sandoval et al., 2019; Sharma & Vredenburg, 1998; Torugsa et al., 2012). Such a response is materialised in the form of proactive environmental practices, that ultimately can improve competitive advantage. However, controversies have arisen around such a relationship and thus, it is a topic that remains under study (Arribas, Espinós-Vañó, García, & Tamošiūnienė, 2019; García et al., 2020). Proactive environmental practices are defined here as organisational actions and decisions concerning the development and introduction of new or improved products, processes, and/or management systems so as to mitigate negative impacts on the natural environment (González-Benito & González-Benito, 2005; Reyes-Rodríguez et al., 2016).

On the other hand, RBV-related studies show a strategic perspective of information systems and technologies (IS/IT), in which competitive valuable resources and capabilities related to IS/IT are characterised as key contributors to the development of organisational strategies and boost competitive advantages (Bharadwaj, 2000; Bhatt & Gover, 2005; Mata et al., 1995; Ravinchandran & Lertwongsatien, 2005; Wade & Hulland, 2004). Further, a growing number of studies has investigated the relevance of IS/IT in connection with the adoption of proactive environmental practices (Benitez-Amado & Walczuch, 2012; Ghobakhloo et al., 2018; Hanelt et al., 2017; Seidel et al., 2013). Yet, they have approached predominantly IS/IT as an attribute that contributes in isolation to the implementation of proactive environmental practices rather than as an attribute that jointly operates with other resources and capabilities for such a purpose.

This study subscribes to the RBV framework and attempts to addressing the above mentioned gap in literature by responding whether and how both organisational and IS/IT resources and capabilities influence the adoption of proactive environmental practices and ultimately an improved environmental performance. In doing so, two organisational capabilities: continuous improvement and stakeholder management are explored together with IS/IT capabilities. We hypothesise that such capabilities are proceeded by the existence of organisational and IS/IT resources, and influence the adoption of proactive environmental practices, which in turn improves environmental performance in firms.

Based on data from 129 small, medium and large firms operating in different industrial sectors in Bogotá, Colombia, the paper's contributions are three-fold: (i) an extension of the RBV framework in the context of environmental management by integrating both organisational and IS/IT resources and capabilities; (ii) an enhanced understanding of the role of IS/IT in the pursuit of environmental sustainability in organisations; and (iii) a validation of the research model in a developing country setting.

The following section presents the literature review and hypotheses development. Then, a description of the research methods and design is detailed, followed by the presentation of the study results and analysis. The remaining sections include the discussion of the key findings and an outline of the conclusions of the research.

2. Theoretical foundations and research hypotheses

Literature provides an understanding of proactive environmental practices as a way to boost competitiveness. Under this perspective, the RBV has been considered as a dominant theoretical driving force, arguing that the management of the interface between business and the natural environment comprises the development of organisational capabilities that are built on firm-specific key resources (Chan, 2005; Hart, 1995; Prieto-Sandoval et al., 2019). In the strategic management literature, firm resources are considered as a major antecedent of a strategy (Grant, 1991) and are characterised by their value, non-substitutability, and non-perfect imitability (Barney, 1991).

Firms control resources to take actions for improve efficiency and effectiveness (Barney, 1991). They are categorised as physical, human and organisational and are inputs of production processes (Grant, 1991). Resources differ from capabilities as resources constitute the raw input to support the business activities of the firm, whereas the latter are organisational routines that imply the interaction and complex coordination of the former (Barney, 1991; Grant, 1991). Hence, resources can be viewed as the antecedent of organisational capabilities. In the realm of environmental issues, this suggested relationship holds as experiential, financial and allied resources that are critical for strengthening firm's capabilities associated with the greening of the business (Leonidou et al., 2017).

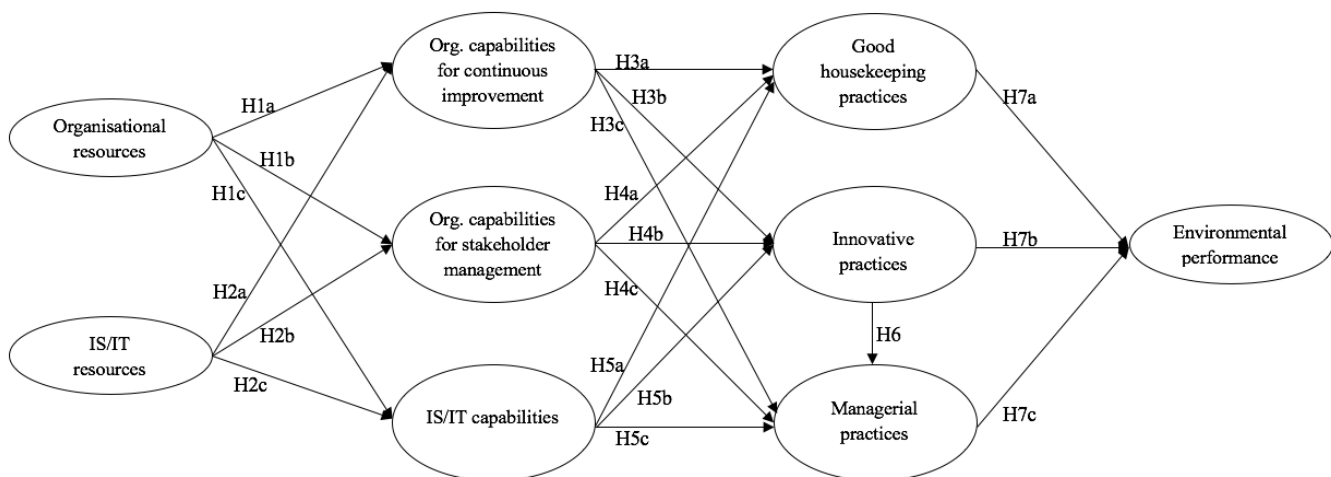
Under this perspective, we advance in proposing a conceptual model that with the research hypotheses of the study (see Figure 1), which are discussed below.


Fig. 1. Conceptual model

Empirical validations in literature on environmental management have approached certain organisational capabilities such as continuous improvement and stakeholder management, which are essential for the adoption of proactive environmental practices (Caldera et al., 2018; Sharma & Vredenburg, 1998; Torugsa et al., 2012). The former refers to the ability to continuously generate innovations resulting from organisational efforts to reduce, minimise and prevent pollution (Hart, 1995; Sharma & Vredenburg, 1998). The latter indicates the ability to establish trust-based collaborative relationships with stakeholders in order to achieve environmental goals (Sharma & Vredenburg, 1998; Torugsa et al., 2012). Developing such organisational capabilities requires holding together heterogeneous and multiple resources across different functions and levels (Leonidou et al., 2017). For instance, physical and technological resources for continuous improvement regarding the redesigning of

production processes (Chan, 2005; Nuhu, 2016; Russo & Fouts, 1997). Human resources are also required for the stablishment of a culture that facilitates the innovation (Rueda-Barrios et al., 2018), which entails an effective application of eco-friendly technologies and properly interact with stakeholders to build strong relationships (Chan, 2005; Torugsa et al., 2012).

On the other hand, IS/IT have been regarded as a strategic factor that influence a firm's ability to enhance performance (Ray et al., 2005; Wade & Hulland, 2004). In this sense, IS/IT capabilities become a relevant construct, referring to an enterprise-wide capability to leverage technology to differentiate from competition that goes beyond a set of sophisticated technological functionalities (Bharadwaj, 2000). They constitute socially complex routines that enable the delivery of information-related services to the organisation and ultimately contribute to competitiveness (Ravinchandran & Lertwongsatien, 2005). In accordance with the RBV, the complexity of IS/IT implies the firm's ability to mobilise and expand IS/IT-related resources in combination with other resources and capabilities so as to contribute to business value (Bharadwaj, 2000; Ravinchandran & Lertwongsatien, 2005). Hence, it is expected that a wide variety of organisational resources (e.g., physical, human, organisational, etc.) to be involved for developing such capabilities. We thus formulate the following hypotheses:

Hypothesis 1a: There is a positive effect of organisational resources on the development of organisational capabilities for continuous improvement.

Hypothesis 1b: There is a positive effect of organisational resources on the development of organisational capabilities for stakeholder management.

Hypothesis 1c: There is a positive effect of organisational resources on the development of IS/IT capabilities.

IS/IT resources, considered as assets and capabilities of the company, do not lead to higher performance of the company by themselves. This kind of resources are mediated by organizational capabilities, these capabilities in turn positively affect the performance of the company becoming a source of sustained competitive advantage (Borek et al., 2012; Uwizeyemungu et al., 2018). IS/IT resources serve as a means to complement organisational processes and contributes to creating business value (Pang et al., 2014). Mata et al. (1995) conceptually approach attributes proper of IT, highlighting the managerial IT skills. Similarly, Wade and Hulland (2004) provide a typology of specific IS resources and emphasize resource complementarity in order to study their effect on firm performance. Marhraoui and El Manouar (2020) state that bundles of key IS/IT resources such as IS/IT infrastructure and IS/IT human resources are enablers of more complex or higher-level organisational attributes and therefore, key to the sustainable performance of companies. Likewise, Ridwandono and Subriadi (2019) argue that IS/IT resources are contribute to improve organizational capabilities and therefore the performance of organisations.

Considering continuous improvement and stakeholder management as such higher-level attributes, it is naturally expected that IS/IT resources become essential for the strategic purpose of these capabilities. On the one hand, corporate efforts to continuously improve processes, operations and procedures requires handling, displaying and analysing information, tasks that are performed through the use an infrastructure in IS/IT and the mobilisation of human resources and technical skills in IS/IT. On the other hand, building trust-based relationships with critical stakeholders takes place on the basis of the adequate and fluid exchange of information, which also demands the deployment of these IS/IT-related resources.

As previously mentioned, the notion of IS/IT capabilities points to the ability of a firm to mobilise, implement and expand IS/IT resources in combination with other resources and capabilities (Bharadwaj, 2000; Ravinchandran & Lertwongsatien, 2005; van de Wetering, 2019). Hence, IS/IT resources are building blocks og IS/IT capabilities.

Bharadhaw (2000) states that IS/IT capabilities comprise five dimensions: technological infrastructure, human IS/IT talent, knowledge, relationships and architecture. Empirical work has evidenced the influence that resources such as IS/IT human capital, IS/IT infrastructure flexibility, and IS/IT relationship quality directly affects IS/IT capabilities in the functional side (Ravinchandran and Lertwongsatien, 2005). Correa Ospina and Díaz Pinzón (2018) argue that there are relationships among IS/IT resources to build up IS/IT capabilities as enablers on organisational performance. Given the above discussion, the following hypotheses are suggested:

Hypothesis 2a: There is a positive effect of IS/IT resources on the development of organisational capabilities for continuous improvement.

Hypothesis 2b: There is a positive effect of IS/IT resources on the development of organisational capabilities for stakeholder management.

Hypothesis 2c: There is a positive effect of IS/IT resources on the development of IS/IT capabilities.

The abovementioned organisational capabilities for continuous improvement and stakeholder management correspond to the original 'strategic resources' constructs devised by Hart (1995), associated to specific 'strategic environmental capabilities' related to pollution prevention and product stewardship (Aragón-Correa et al., 2008; Caldera et al., 2018; Christmann, 2000; López-Gamero et al., 2009; Sharma & Vredenburg, 1998). Continuous improvement has been particularly associated to the adoption of pollution prevention in the form of good housekeeping practices as well as innovative practices since they require companies to develop resources such as physical assets, technologies and skills, and cross-functional integration (Russo & Fouts, 1997) to change the experiential base of organizational activities, routines, and goals (Sharma & Vredenburg, 1998). Stimuli to waste minimization are also related to "the capacity of organizations to engage in collaborative learning and continuous improvement on a number of fronts" (Vickers & Cordey-Hayes, 1999, p. 89). Further, continuous improvement capabilities becomes a natural approach when adopting environmental practices related to managerial aspects when working towards the meeting of certifiable international standards (Heras-Saizarbitoria et al., 2020; Prieto-Sandoval et al., 2019). In sum, capabilities for continuous improvement comprises the ability to create new environmental initiatives materialised into products, processes and involves the initiation of changes in environmental policies and activities (Albertini, 2019; Boakye et al., 2020). Thus, the following hypotheses are thus, formulated:

Hypothesis 3a: There is a positive effect of organisational capabilities for continuous improvement on the development of proactive environmental practices related to good housekeeping practices.

Hypothesis 3b: There is a positive effect of organisational capabilities for continuous improvement on the development of proactive environmental practices related to innovative practices practices.

Hypothesis 3c: There is a positive effect of organisational capabilities for continuous improvement on the development of proactive environmental practices related to managemerial practices.

On the other hand, proactive environmental practices in terms of product-stewardship are related to a stronger stakeholder orientation by the inclusion of their perspectives in the processes of product-development and planning (Caldera et al., 2018; Hart, 1995; Torugsa et al., 2012). As previously mentioned, a stakeholder management capability is based on trust-based collaborative relationships with a variety of stakeholders (Sharma & Vredenburg, 1998; Vishwakarma et al., 2019). Through collaborative relationships with stakeholders, firms can learn more about how firm's operations should be, the improvement of routines and operations, better approaches to product lifecycle assessment and the designing of more environmentally friendly products that meet the expectations of customers and suppliers (Albertini, 2019; Salem et al., 2016). In general, such relationships can

provide direction and course of action of the strategy and the managerial dimension in which proactive environmental practices are embedded (Albertini, 2019; Buysse & Verbeke, 2003). Therefore, organisational capabilities for stakeholder management becomes an antecedent of the implementation of proactive environmental practices. The following hypotheses are thus, formulated:

Hypothesis 4a: There is a positive effect of organisational capabilities for stakeholder management on the development of proactive environmental practices related to good housekeeping practices.

Hypothesis 4b: There is a positive effect of organisational capabilities for stakeholder management on the development of proactive environmental practices related to innovative practices.

Hypothesis 4c: There is a positive effect of organisational capabilities for stakeholder management on the development of proactive environmental practices related to managerial practices.

Firm's IS/IT capabilities refer to the ability to mobilise and deploy specific IS/IT resources effectively combined with other resources and capabilities so that superior performance is achieved (Bharadwaj, 2000). They include experience and relational infrastructure (Bhatt & Gover, 2005), that, when channelled, lead to the adoption of distinctive strategies and the development of competencies (Ravinchandran & Lertwongsatien, 2005).

IS/IT capabilities imply features for monitoring, analysis, and display of information (e.g., resource consumption, environmentally harmful outputs, etc.) that allows the organisation to make sense of the situation and in turn reconsider beliefs, routines and actions. This provides the ground for the implementation of proactive environmental practices (Seidel et al., 2013). IS/IT capabilities are relevant for storing, managing, and displaying information for the implementation of proactive environmental practices related to managerial aspects (De Camargo Fiorini et al., 2019). For instance, information on human and financial resources as well as audits and periodic evaluations assist in the establishment and dissemination of goals and the benchmarking of activities to improve current practices towards environmental protection (Benitez-Amado & Walczuch, 2012; De Camargo Fiorini et al., 2019). In the same vein, IS/IT capabilities boost the internal transfer of tacit and explicit knowledge on regulations and best practices in connection with environmental protection between business units and/or functional departments (Benitez-Amado & Walczuch, 2012; Sharma & Vredenburg, 1998; Yousif et al., 2017).

At operational level, IS/IT capabilities are key for the exchange of information and knowledge related to lifecycle assessment practices as they require dealing with sorts of information not only from manufacturing-related data but also from suppliers, audits and surveys (Ghobakhloo et al., 2018; Melville, 2010). Market intelligence enabled by IS/IT capabilities may allow firms to sense and seize opportunities in order to respond proactively by the development of environmentally friendly products and services (Benitez-Amado & Walczuch, 2012). On the other hand, IS/IT capabilities can assist the selection of suppliers based on green criteria and collaborative production management across the supply chain in order to enable environmentally friendly product development (De Camargo Fiorini et al., 2019; Ghobakhloo et al., 2018). Furthermore, the management and control of environmentally-related indicators in production processes (e.g., waste, energy consumption, toxic material, water use, etc.) reduces uncertainties and assists decision making for the improvement of eco-efficiency of the business processes. Less uncertainties about processes help the targeted implementation of technological alternatives with reduced environmental impact (Hanelt et al., 2017). Given the above, we propose the following hypothesis:

Hypothesis 5a: There is a positive effect of IS/IT capabilities on the development of proactive environmental practices related to good housekeeping practices.

Hypothesis 5b: There is a positive effect of IS/IT capabilities on the development of proactive environmental practices related to innovative practices.

Hypothesis 5c: There is a positive effect of IS/IT capabilities on the development of proactive environmental practices related to managerial practices.

Environmental innovations and practices related to managerial aspects are related. That is, the establishment of management related environmental practices emerges as a result of planned environmental innovations (Rehfeld et al., 2007). The implementation of managerial practices such as environmental management systems is closely linked to pre-existing component of tacit knowledge derived from innovative practices that comprise reformulation and improvement of products, services and processes (Amores-Salvadó et al., 2015; Dragomir, 2020). Such a knowledge becomes a baseline for the formulation of environmental goals and the shaping of policies. Proactive practices in managerial aspects constitute a form of organisational capital (procedures and norms) that guides the greening of the firm provided the technological capital that results from innovative practices in environmental management (Amores-Salvadó et al., 2015; Nemlioglu & Mallick, 2017). In other words, proactive environmental practices related to tangible innovations in products provides the basis for the adoption of proactive environmental practices related to intangible managerial aspects (Ziegler & Seijas Nogareda, 2009). Based on this, the following hypothesis is stated:

Hypothesis 6: There is a positive effect of proactive environmental practices related to innovative practices on the adoption of proactive environmental practices related to managerial practices.

Finally, it is of interest to study the effect of proactive environmental practices on firm's environmental performance. Judge and Douglas (1998) refer to environmental performance as the effectiveness of the firm to meet and exceeding social expectations with respect to the natural environment. That is, the ability of the firm to successfully meet and exceed those expectations. Literature has shown a relationship between environmental practices and performance (Chan, 2005), and that those differentiated proactive environmental practices result in dissimilar outcomes on environmental performance (Betts et al., 2018; González-Benito & González-Benito, 2005; López-Gamero et al., 2009). Therefore:

Hypothesis 7a: There is a positive effect of proactive environmental practices related to good housekeeping practices on environmental performance.

Hypothesis 7b: There is a positive effect of proactive environmental practices related to innovative practices on environmental performance.

Hypothesis 7c: There is a positive effect of proactive environmental practices related to managerial practices on environmental performance.

3. Methods

3.1 Sample and procedures
We collected data from 129 firms participating in the first and second stages, out of five, of a two-year assistance and education programmes promoted by the Secretary of the Environment of Bogotá, Colombia called Corporate Environmental Management (*Gestión Ambiental Empresarial*) in 2018. The program intended to engage firms in environmental improvement (see Parker et al., (2009) about this type of programs in general). By addressing these firms, we made sure that they are under the process of acting towards the natural environment by means of the implementation of practices at both operational and managerial levels. In terms of size, the sample consisted of 107 firms performing manufacturing activities in sectors such as paper and printing, chemical, pharmaceutical, metalmechanics, food and beverages, textile, furniture, automotive and oil, wood transformation, and other

manufacturing activities. The remaining 22 firms operated in service-related sectors such as healthcare, professional and personal services as well as transportation and logistics. In terms of size, according to the classification of the European Commision (Eurostat, 2020), the sample consisted of 49 small firms, employing between 10 and 49 employees; 57 medium-sized firms, employing between 50 and 249 employees; and 23 large firms, employing more than 250 employees.

Prior to the data collection, an early version of the survey instrument was developed by including items from previous studies as well as adaptations based on findings of a qualitative stage prior to this study. Then, a pilot study was performed, which consisted of the application of an initial paper-based questionnaire to 73 firms participating in the programs administered by Bogotá's Secretary of the Environment. Based on the results of validation of the instrument, some adjustments ware made and an on-line version of the questionnaire was then sent to representatives (i.e., general managers, environmental managers, and environmental assistants) of the firms.

After sending the final, on-line questionnaire to a population of 360 firms, 189 questionnaires were returned, which represented 51% of response rate. Then, procedures to verify the quality of data were carried out since the survey was applied to a pre-recruited non-probabilistic panel (Couper, 2000). We followed the most relevant procedures associated to web-based studies: diversity of respondents, seriousness of responses (i.e., repeatedly endorsing items regardless of content, or acquiescence), and repeated responses (Gosling et al., 2004; Sax et al., 2003). As a result, 22 questionnaires were discarded.

Nonresponse bias (Armstrong & Overton, 1977) was tested by carrying out wave analysis. Firms who responded right after the survey was made available were compared with those who responded after a first and second reminders. Comparisons of survey results revealed no statistically significant differences between the three groups at the level of demographic variables. Then, 38 further questionnaires were excluded because they came from firms with ten or less employees. Environmental awareness or eco-literacy are low in most micro-enterprise owners since financial and human resources are limited, which limits voluntary action (Mir & Feitelson, 2007). After following these procedures, the 129 cases were retained in the sample for subsequent analyses.

Data from the final sample were analysed following this sequence: a characterisation of the sample, an exploratory principal component analysis (EPCA), confirmatory factor analysis (CFA), and covariance-based structural equation modelling (CB-SEM).

3.2 Measures

Variable selection in environmental management, and in general sustainability-related studies, is critical (Arribas, Espinós-Vañó, García, & Morales-Bañuelos, 2019). We adapted items from the literature and used Likert scales (see Appendix).

Some constructs of the questionnaire were measured with the 7-point Likert scale and others with the 5-point scale. The scales were implemented according to the nature and intention of the construct. For the constructs that measured the company's attitude (attention, relationship, adoption, and use), scales from 1 to 5 were used: Stakeholder management, IS/IT capabilities and proactive environmental practices. For the constructs that measured the availability of resources and performance evaluation of the company, scales from 1 to 7 were used: organizational resources, IS/IT resources, continuous improvement and environmental performance. We considered to respect the scales originally proposed by the authors and which were validated in their studies, also with the purpose of comparing our results with those of these sources. However, this is not a limitation since the proposed scales are not mixed within the same construct, and therefore there are no differences between the weight of the variances of the same construct.

The underlying structure among the variables was evaluated through EPCA with varimax rotation and reliability estimates were calculated (Hair et al., 2009). All loadings of items were equal or above to .600 after performing EPCA. Construct measurements are presented as follows:

Organisational resources: Seven items, including several from Chan (2005) assessed the availability of resources in the firm using a seven-point scale (1 = "scarce" to "7 = very abundant"). After the EPCA, six items were retained constituting one single factor.

IS/IT resources: Seven items were adapted from Byrd and Turner (2000) and Ravinchandran and Lertwongsatien (2005) to assess the degree of each respondent's agreement using a seven-point Likert scale, ("1 = completely disagree" to "7 = completely agree"). They formed one single factor after EPCA.

Continuous improvement. Four items drawn from Sharma and Vredenburg (1998) assessed the degree of each respondent's agreement using a seven-point Likert scale, ("1 = completely disagree" to "7 = completely agree"). Three of them were retained and formed one factor after EPCA.

Stakeholder management. Based on the approach of Aragón-Correa *et al.* (2008), six items assessed separately—in two complementary statements—the attention given by each firm to different types of stakeholders, as well as the influence of each stakeholder has on the firm's environmental management decisions. Measures consisted of a five-point scale ("1 = none" to "5 = great attention" or "5 = very strong influence"). The combined measure results from multiplying the scores assigned to importance and attention. The six items formed one single factor after EPCA.

IS/IT capabilities: Eleven items adopted in part from Ravinchandran and Lertwongsatien (2005) assessed the extent of use of IS/IT to several functions and activities using a five-point scale (1 = "none" to "5 = very much"). After EPCA, only seven items were retained and organised in two factors, labelled as "IS/IT support to general functional activities" and "IS/IT support to environmental management".

Proactive environmental practices. Seventeen items, several drawing from Christmann (2000), Chan (2005), and Aragón-Correa et al. (2008) assess the degree of adoption of proactive environmental practices using a five-point scale ("1 = we have not considered this issue at all" to "5 = we are leaders in this practice in our sector"). After EPCA, ten of these items were retained in three factors—labelled as "Good Housekeeping Practices", "Innovative Practices", and "Managerial Practices".

Environmental performance. Four items adapted from Karagozoglu and Lindell (2000) assess relative environmental performance, compared with competitors', through a seven-point scale ("1 = we are far behind" to "7 = we have a very large advantage"). After EPCA, three of them formed one factor.

Control variables: The number of employees was used as a measure for firm size. However, in the structural equation modelling the natural logarithm was calculated and considered as a control variable. Further, a dummy variable was also used as a control variable to measure industrial sector in two main categories: 0 = services and other activities, and 1 = manufacturing activities.

4. Results

After performing EPCA, confirmatory factor analysis (CFA) was used to assess the fit of the hypothesised measurement model to the data. The procedure of treating ordinal variables with five or more categories as

continuous variables was followed as it does not impose practical impact on the results (Johnson & Creech, 1983). As the hypotheses for univariate and multivariate normal distribution of the data were rejected, we performed parameter estimation to assess the measurement model using Robust Maximum Likelihood (RML) method using LISREL 8.8 following a covariance-based approach (Jöreskog et al., 2001).

Standardised item-factor loadings retained with CFA are all greater than or equal to .600 (Hair et al., 2009) and the Average Variance Extracted (AVE) was calculated for all of the constructs in order to determine convergent validity (Fornell & Larcker, 1981). AVE values were above the .500 threshold in most cases with the exception of innovative practices, whose AVE value was .46. However, given the theoretical grounding of this factor and its relevance for the study, we decided not to exclude it from the model. In order to improve model fit and obtain acceptable values for standardised residuals, the items ORR2, ORR5, ITR2, ITR6, STM4 and ITC1 were dropped (see the Appendix). Table 1 shows the means, standard deviations, reliability coefficients, and correlations among the constructs after conducting CFA.

Table 1. Descriptive statistics and correlations among the variables/constructs

Construct/ variable	Mean	s.d.	1	2	3	4	5	6	7	8	9	10	11	12
1. Size (LnEmp)	4.389	1.263	-											
2. Sector	.780	-	-.255**	-										
3. Organisational Resources	4.773	1.133	.293**	-.141	.869									
4. IS/IT Resources	4.921	1.355	.343**	-.180*	.520**	.860								
5. Continuous Improvement	5.568	1.069	.228**	-.189*	.407**	.510**	.807							
6. Stakeholder Management	15.661	5.038	.083	-.220*	.389**	.340**	.313**	.804						
7. IS/IT Support to General Functional Activities	3.620	.868	.200*	-.054	.326**	.372**	.086	.228**	.867					
8. IS/IT Support to Environmental Management	3.543	.966	.028	-.092	.218*	.353**	.210*	.273**	.541**	.799				
9. Good Housekeeping Practices	3.752	.563	.042	-.062	.349**	.256**	.411**	.234**	.032	.063	.764			
1. Innovative Practices	3.043	.744	-.056	-.138	.391**	.288**	.248**	.300**	.171	.223*	.411**	.763		
11. Managerial Practices	2.871	.900	.230**	-.250**	.372**	.365**	.323**	.430**	.236**	.270**	.236**	.469**	.804	
12. Environmental Performance	4.341	1.116	.054	-.258**	.371**	.247**	.358**	.376**	.214*	.273**	.376**	.413**	.331**	.868

Correlations are obtained from summated scales. Scale reliabilities (Cronbach's alpha) are on the diagonal in boldface.
*p < .05; **p < .01.

Furthermore, we found that the squared root of respective AVE for each pair of latent variables were always larger than their shared correlation, which evidenced discriminant validity (Fornell & Larcker, 1981). The appendix contains the item loadings after conducting CFA as well as the AVE for each construct. Fit statistics for the measurement model were adequate ($\chi 2$ = 565.005, df = 482, p = .119, RMSEA = .024, NFI = .912, CFI = .993, IFI = .993).

The structural model was stablished taking organisational resources, IS/IT resources, size, and sector as the exogenous latent variables. Size and sector were control variables. Endogenous latent variables comprise continuous improvement, stakeholder management, IS/IT support to general functional activities, IS/IT support to environmental management, good housekeeping practices, innovative practices, managerial practices, and environmental performance.

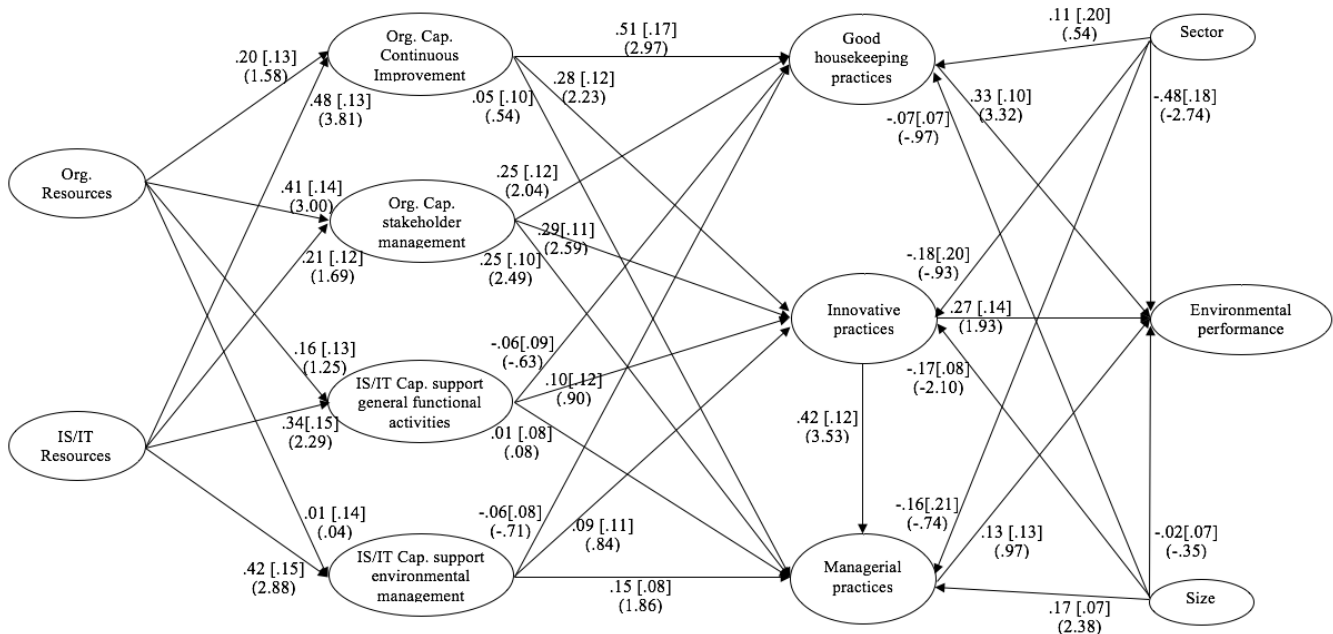
Figure 2 shows the final results of the structural model, where the parameters for the relationships between the constructs are estimated. The hypothesised model provided an adequate fit to the data ($\chi 2$ = 646.859, df = 558, p = .005, RMSEA = .035, CFI = .984; IFI = .984). Fit indices are acceptable considering the number of observations per group and the number of observed variables. In particular, under these conditions, it is expected to find significant p-values for the Chi-square statistic even with good fit (Hair et al., 2009).


Fig.2. Final results of the structural model ($\chi 2$ = 646.859, df = 558, p = .005, RMSEA = .035, n=129). Numbers above are standardised path coefficients [standard errors of estimates], and t-values in parenthesis below

According to the results exhibited in figure 2, organisational resources influence only the development of a capability of stakeholder management given the statistically significant effect. Thus, hypothesis 1a is supported whereas hypotheses 1b and 1c are not supported. On the other hand, IS/IT Resources have positive and statistically significant effects on all of the firm capabilities. This provides full support to hypotheses 2a, 2b and 2c.

Regarding the influence of organisational capabilities for continuous improvement on environmental management practices, only hypotheses 3a and 3b are supported because such capabilities have a statistically significant effect on proactive environmental practices related to both good housekeeping and innovative practices. Yet, hypotheses 4a, 4b, and 4c are fully supported due to the positive and significant effect of organisational capabilities for stakeholder management on all three forms of proactive environmental practices. Furthermore, because of the

only statistically effect of IS/IT capabilities related to the support to environmental management on proactive environmental practices related to managerial practices, only hypothesis 5c is partially supported.

Hypothesis 6 is confirmed due the positive and statistically significant effect of proactive environmental practices related to innovative practices on managerial practices. Concerning the effect of proactive environmental practices on environmental performance, results provided support only to hypotheses 7a and 7b since that performance is influenced only by proactive environmental practices related to good housekeeping and innovative practices. Table 2 summarises the hypotheses test results of the structural model.

Finally, size has a positive and significant effect on proactive environmental practices related to managerial practices (β=.17; p<.05), whereas there is a negative and significant influence on innovative practices (β= -.17; p<.05). Industry sector only has a negative and significant effect on environmental performance (β= -.48; p<.01).

5. Discussion

Results evidenced the strategic role of organisational and IS/IT resources in paving the way to the development of both organisational and IS/IT capabilities. Yet, organisational and IS/IT capabilities are predominantly determined by the availability and use of IS/IT resources rather than organisational resources. In particular, organisational resources are an antecedent of the development of a capability for stakeholder management. That is, sampled firms use their quality control systems, technological and physical resources, and reputation to build trust-based collaborative relationships with stakeholders when dealing with environmental concerns. Despite these results are in line with findings of Chan (2005), we did not find evidence of the effect of organisational resources on continuous improvement and IS/IT capabilities, which partially supports the hypothesised influence of such resources. In this case, firms rely more on the availability, combination and use of IS/IT resources in terms of skills of IS/IT staff, modularity of applications, and technological infrastructure to develop organisational and IS/IT capabilities. Hence, IS/IT resources become a key strategic attribute that determine the development of capabilities as assert Ravinchandran and Lertwongsatien (2005), particularly related to improvement efforts, collaboration with stakeholders and deployment of the IS/IT-related capabilities as such.

Our findings evidence the role of organisational and IS/IT capabilities in boosting the adoption of proactive environmental practices in sampled firms. As the NRBV-related literature predicts (Hart, 1995; Hart & Dowell, 2011), there is an influence of the capability for continuous improvement on the development of proactive environmental practices at the level of good housekeeping practices and innovative practices (i.e., input substitution, product re-design, and process modification). This shows that continuous improvement is crucial for the adoption of the operational and engineering aspects of proactive environmental practices. That is, such capability in firms drives response through routinely actions in processes and operations that represent incremental changes towards environmental protection. At the same time, it paves the way to more radical changes related to product and process modification based on environmental grounds (Christmann, 2000).

A capability for stakeholder management in the studied firms is linked to the adoption of proactive environmental practices. That is, the importance and attention paid to primary stakeholders (Clarkson, 1995)–owners and shareholders, employees and suppliers–will determine corporate response to environmental concerns through initiatives at operational, technical and managerial levels. This is not surprising as previous literature argues for the importance that managers give to different stakeholder groups to the development of proactive environmental practices given the collaborative relationships that can be established to consider their preferences and garner resources (Aragón-Correa et al., 2008; Buysse & Verbeke, 2003; Caldera et al., 2018; Sharma & Vredenburg, 1998).

Table 2. Summary of hypothesis test results

Hypothesis	Path coefficient	t-value	Conclusion

†p < .1; *p < .05; **p < .01; ***p < .001.

Concerning the relationship between IS/IT capabilities and the adoption of proactive environmental practices, there is only evidence of influence of the capability for IS/IT support to environmental management activities on managerial practices. In this sense, results highlight that IS/IT capabilities enable a managerial aspect of environmental protection through capturing, storing, processing and visualising relevant data and information (Ghobakhloo et al., 2018), particularly related to regulations and norms, technical aspects and availability of clean

technologies. Through these characteristics, capabilities for IS/IT support to environmental management allow the firm to reconsider beliefs, actions, outcomes of operations and routines (Seidel et al., 2013), and redirect them towards the reduction of environmental impact related to prevention and control strategies (Benitez-Amado & Walczuch, 2012; De Camargo Fiorini et al., 2019; Hanelt et al., 2017).

When looking at both IS/IT resources and capabilities, the findings reveal that IS/IT resources become more critical than IS/IT capabilities when assuming a proactive stance towards environmental protection. In general, continuous improvement and stakeholder management are the main drivers of action in terms of environmental management practices. Notwithstanding, the capabilities approached in this study are mainly shaped by IS/IT resources suggesting thus an indirect effect of IS/IT resources on the adoption of proactive environmental practices. Interestingly, it is worth highlighting the relationship between IS/IT resources and innovative practices, mediated by the development of a continuous improvement capability. For this case, innovative practices, which have higher probability of leading to "complete offsets" (Popp, 2005), ultimately rely on IS/IT resources. The non-supported effects of IS/IT capabilities on proactive environmental practices in terms of good housekeeping and innovative practices may be due to the lack of awareness and knowledge by firms about "the substantial influence of [IS/IT] on the organisation's environmental footprint" and "…how [IS/IT] can be integrated into their environmental programs" (Jenkin et al., 2011, p. 302).

The positive effect of innovative practices on managerial practices found in this study reveals that firms that already achieved environmental innovations have enough capabilities to overcome management barriers (Amores-Salvadó et al., 2015; Ziegler & Seijas Nogareda, 2009). That is, firms acquire capabilities through the implementation of innovative practices towards environmental protection that allow them to adopt managerial practices such as environmental audits, handbooks of procedures and insurance plans against environmental risks. In other words, innovative approaches in the engineering side of proactive environmental practices (i.e., changes in products and processes) shapes the managerial dimension of those practices in firms.

The role of proactive environmental practices accounts for the relationship between resources and capabilities with environmental performance as previous studies found (Aragón-Correa et al., 2008; Chan, 2005; Leonidou et al., 2017; Russo & Fouts, 1997; Uwizeyemungu et al., 2018). Firms studied in this work exhibit a better environmental performance derived from innovative practices, which imply transformational changes in processes and business practices. Furthermore, an improved environmental performance is also a consequence of transformations in the operations system (González-Benito & González-Benito, 2005). We did not find evidence of the implication of the managerial aspects of proactive environmental practices on environmental performance. This is in line with previous studies that indicated that the adoption of managerial practices does not guarantee a contribution to a better environmental performance (Heras-Saizarbitoria et al., 2020) as they may constitute "a form of symbolic environmentalism" (Testa et al., 2018).

In regards to firm size as control variable, results show that smaller firms tend to adopt innovative practices. This may be explained by the flexibility, adaptability, orientation for innovativeness and shorter lines of communication as proper characteristics of small firms that allow environmental proactivity (Aragón-Correa et al., 2008; Boakye et al., 2020; Reyes-Rodríguez et al., 2016), which has been shown in the case of such firms in Colombia (DAMA-CINSET, 1996). However, findings indicate that smaller firms seem to be reluctant for the adoption of managerial practices because they do not perceive standards strategically, and they are specific-customised whereas standards are generic (Chasse & Boiral, 2016; Gesternfeld & Roberts, 2000). In other words, a formalisation does not allow small firms to adopt managerial practices. In the light of the validation of hypothesis 7, these particular findings show that the adoption of managerial practices has innovative practices as an antecedent, but at the same time require formalisation and standards, which is a characteristic of larger firms.

With respect to industry sector, results show that in the Colombian context, firms belonging to services and other activities exhibit a better environmental performance than manufacturing firms. This supports the conception of manufacturing firms–leather-tanning, non-ferrous metals, wood products, chemical substances, non-metallic products, food, iron and steel, paper and printing –as firms with high environmental significance (DAMA-CINSET, 1996; Sabogal Mogollón, 2005).

6. Conclusions, limitations and implications

The aim of this study was to deepen understand the relationship between both organisational and IS/IT resources and capabilities and proactive environmental practices. Our answer to the research question is that IS/IT resources are more critical than organisational resources in the development of both organisational and IS/IT capabilities. In turn, organisational capabilities such as continuous improvement and stakeholder management are key antecedents of the development of proactive environmental practices related to operational, innovative and managerial aspects whereas IS/IT capabilities adopt a supporting role, specifically towards the adoption of the managerial aspects of proactive environmental practices. The ultimate effect on an improved environmental performance is determined by the more tangible aspects of proactive environmental practices focused on products and processes rather than practices related to managerial aspects.

The paper contributes to the environmental management literature by examining an integration of both organisational and IS/IT resources and capabilities in paving the way to the adoption of proactive environmental practices and improve environmental performance. This constitutes an extension of the RBV framework in the realm of environmental management and confirms the endogenous nature of the greening of businesses. Further, the study contributes to the IS/IT literature by approaching IS/IT understood as resources and capabilities in the pursuit of transformations towards environmental sustainability. The results show that IS/IT does not work in isolation but contributes jointly with further organisational attributes to the fulfilment of organisational goals, in this case the implementation of proactive environmental practices and the improvement of environmental performance. Finally, our study contributes to the literature in environmental management by validating a model that explains environmental commitment in firms in a developing country setting. Despite firms in the sample have been actively participating in training and counselling schemes provided by the environmental authority, our results show that firms in such a particular setting have been able to develop strategic attributes by themselves that allow them to proactively respond to the demands for the protection of the natural environment.

Our research has limitations that must be acknowledged. First, the theoretical model did not explore the implications on competitive advantage so as to fully validate the RBV approach in the context of environmental management. Hence, it is important to explore dimensions of competitive advantage and their relationship with environmental performance and proactive environmental practices. Second, the adopted theoretical approach did not involve external factors that might also explain the adoption of proactive environmental practices. For this purpose, the consideration of contingency and institutional theories could be useful in the exploration of external drivers of proactive environmental practices as well as factors that might moderate the relationship between both organisational and IS/IT capabilities and proactive environmental practices. Third, in terms of methods, the limited sample size did not allow us to provide further analyses by comparing sub-models using industrial sectors as criteria. Finally, the cross-sectional nature of the research design imposed a limitation itself. Longitudinal data will certainly be useful for tracking the development over time of the studied resources and capabilities and the relationships with proactive environmental practices and environmental performance.

The implications for practitioners and policy makers suggests that Colombian firms not only may exhibit differentiated degrees of proactivity in their organisational responses to stakeholder pressures for improved environmental performance, but that they also may be aware of the importance of information management. There

is a call for the environmental authority in Bogotá to offer training programs and incentives about the importance of information management and their associate mechanisms and technologies. Consequently, resource use, materials and energy could be tracked, and environmental regulations could be monitored. It is necessary to highlight the support of IS/IT in the achievement of environmentally-friendly operations by undertaking substantial changes in products and processes counting with the perceptions and perspectives of different stakeholders.

THE INSTIGATION OF HATRED: QUESTIONS OF LEGAL EVALUATION AND PROCEDURAL ISSUES

Dovilė Murauskienė ¹, Raimundas Jurka ², Jolanta Zajančkauskienė ³

1, 2, 3 Law School of Mykolas Romeris University, Ateities Str. 20, LT-08308, Vilnius, Lithuania

Abstract. Considering the infringements upon the principle of equality caused by hate crimes, as well as the negative impact of such crimes not only on their victims but also on other persons within the same group of vulnerable people, the authors of this paper analyse hate speech as a criminally punishable act. The analysis of this issue is of essential importance as hate speech manifests on the internet, often via comments made online, a worrying issue as hate speech is therefore often tolerated. This article raises the question of the delimitation of hate speech from hate crime; the authors present an analytical overview of national and international case law, providing an insight into the process of distinguishing hate speech from a person's right to exercise their freedom of self-expression. A separate section covers the challenges that law enforcement authorities face when investigating incidents of hate speech online, where criminal activities often trespass the borders of a single state and their investigation requires tools of international cooperation to receive or transfer electronic evidence.

1. Introduction

Criminal acts motivated by hate violate, in particular, the principle of equality of persons, which is considered a fundamental constitutional value. This type of crime and the reasons behind it (homophobia, xenophobia, racism, discrimination, etc.) are greatly divisive in society. Historically, the groups that are the target of hatred have most often already been subjected to some form of discrimination (for instance according to their race, skin colour, religion, sexuality, etc.). Therefore, the protection of their rights and the delivery of justice are vital in preventing divisions and hostility between different groups in society, which can escalate into active discrimination or even physical violence (European Union Agency for Fundamental Rights, 2012). Criminal acts of this type are often referred to as 'a message for action'. The victims of such criminal acts and other people associated with the same

groups receive a 'clear message' that they are undesirable and not welcome in the society, and therefore feel unsafe. Thus, such acts cause not only the primary victimisation of the victim, but also the indirect victimisation of individuals belonging to the same groups.

For this reason, democratic countries unanimously agree that, firstly, there must be clear criteria for identifying such criminal acts and, secondly, clear law enforcement practices must be developed in line with international standards, according to which perpetrators must be held legally liable for hatred-motivated acts that breach the law. Thirdly, clear criteria must be established in case law to distinguish between hate crimes and the exercise of freedom (right) of expression. This requires scientific foundations, with clarity in the definitions of such criteria.

Finally, hate speech, as a form of hate-motivated crime, is most often committed online, and often extends beyond the borders of a single state. Therefore, law enforcement authorities face the challenge of collecting data (evidence) relevant to the investigation of a criminal offence; they make use of legal aid mechanisms based on the principles of international cooperation.

Considering the fact that instigations of hatred are mainly committed on the internet, alongside commercial web pages, the question of the negative and positive responsibility of specific businesses and commercial companies must be raised. This is a far-reaching issue, as on 10 June 2009 the Estonian Supreme Court (*Vjatsheslav Leedo v. AS Delfi*) emphasized the responsibility of the Delfi Estonia internet portal for tolerating such comments. The Court also stated that if e-comments are full of slander, vulgar, humiliating, or threatening, then the administrator must take all possible actions to remove them. In this case, the European Court of Human Rights (ECtHR) was also mindful, in this context, of the importance of the wishes of internet users not to disclose their identity in exercising their freedom of expression. At the same time, the spread of the internet and the possibility—or for some purposes the danger—that, once made public, information will remain public and circulate forever, calls for caution. The ease of disclosure and substantial volume of information on the internet means that it is a difficult task to detect defamatory statements and remove them. This is true for an internet news portal operator, as in the present case, but this is an even more onerous task for a potentially wronged person, who would be less likely to possess the resources required for the continual monitoring of the internet. The Court considered the latter element an important factor in balancing the rights and interests at stake. A number of other elements were also relevant, in particular: the insulting and threatening nature of the comments, the fact that the comments were posted in reaction to an article published by the applicant company in its professionally-managed news portal run on a commercial basis; the insufficiency of the measures taken by the applicant company to avoid damage being caused to other parties' reputations and to ensure a realistic possibility that the authors of the comments will be held liable; and the moderate sanction imposed on the applicant company. Based on these elements, the Court considered that, in the present case, the domestic courts' finding that the applicant company was liable for the defamatory comments posted by readers on its internet news portal was a justified and proportionate restriction on the applicant company's right to freedom of expression. There has, accordingly, been no violation of Article 10 of the European Convention for the Protection of Human Rights and Fundamental Freedoms (hereinafter – the Convention, ECHR; *DELFI AS v. Estonia*, 2013).

Incidentally, by way of example, in 2017 the Parliament of the Federal Republic of Germany also made the step of enacting the law to fight the instigation of hatred on social media. According to this law, social media companies must remove any comments that instigate hatred within a period of 24 hours. The sanctions for being passive in this regard can reach up to €20 million. This country should be seen as the pioneer in providing financial sanctions for social media companies (Normantaitė, 2017).

Despite these considerations clearly demonstrating the relevance of hate-motivated crimes, Lithuanian legal theory has studied the matter only sporadically. A somewhat more detailed analysis of related aspects is presented in a number of papers by V. Čigrin (2013), I. Balsiūnaitė (2016), or I. Isokaitė (2015). The most recent papers in

this area are the guidelines drawn up by D. Murauskienė (2019) on the application of criminal responsibility for hate speech and hate crimes, or the methodological aid for in-service training produced by Ž. Navickienė and K. Miliūnė (2020). Issues of the social and legal assessment of hate crimes and hate speech have been addressed in a number of publications by non-governmental organizations (e.g., Bitiukova, 2013; Normantaitė, 2017, etc.).

With respect to the issue of procedural evidence that arises in investigating hate speech acts online, specifically regarding obtaining or transferring evidence in cross-border cases, a number of papers by Lithuanian scholars are of note, for instance the publications of Jurka (2019) and Jurka and Zajančkauskienė (2016). The issue has been examined to a much greater extent in papers by foreign scholars (Stefan & González Fuster, 2018; Smuha, 2018; Tinoco-Pastrana, 2020; and others).

Incitement to hatred [authors' note: the terms *incitement to hatred* and *hate speech* are used synonymously in the present paper], the consequences thereof, the severity of the criminal acts, and the scarcity of studies in this area prompted the authors to address the most important issues related to both legal evaluation and procedural evidence-related matters (objective). These issues include: the concept of hate speech; the criteria for the delineation of hate speech from hate crimes and exercising the freedom of self-expression; and the legal procedures for obtaining and transferring e-evidence to other states for the purpose of cross-border investigations of incitements to hatred online (tasks). For the purpose of the present paper, issues of hate crimes are analysed only to the extent necessary to define and interpret the concept of incitement to hatred.

A number of empirical data collection methods, such as analysis of research papers and legal instruments (the decisions and rulings of national and international courts), were used for the purpose of drawing up the present paper. This paper analyses select decisions of various national and international courts – critical cases that best illustrate the issues raised in the study. The selected data was processed using the most common theoretical research methods, such as systemic analysis, induction, and comparative analysis.

2. The concept of hate speech and its distinction from hate crimes

Hate is a general term for motivated crime that includes both hate crimes and hate speech (Murauskienė, 2019). Initially, Recommendation No. R (97) 20 of the Committee of Ministers of the Council of Europe to Member States on 'hate speech', adopted on 30 October 1997, introduced the term *hate speech*. It was defined as covering all forms of expression which spread, incite, promote, or justify racial hatred, xenophobia, anti-Semitism, or other forms of hatred based on intolerance (Council of Europe, 1997).

Hate speech also includes intolerance expressed by aggressive nationalism and ethnocentrism, or by discrimination and hostility against minorities, migrants, and people of immigrant origin (Council of Europe, 1997).

The term *hate crime* was used for the first time in Europe at the 2003 meeting of the Council of Ministers in Maastricht, hosted by the Organization for Security and Cooperation in Europe (OSCE). The meeting laid the foundations for the development of the concept of hate crimes, including all forms of racist, xenophobic violence and anti-Semitism (Organization for Security and Co-operation in Europe, 2003).

For a long time, Lithuania's approach was that *hate crimes* is a general term that also includes hate speech. It could be assumed that this approach was, to a certain extent, shaped by the definition of hate crime presented in the Recommendation of the Prosecutor General of the Republic of Lithuania 'On the organization, management and conduct of pre-trial investigations into criminal offences committed on racial, nationalist, xenophobic, homophobic or other discriminatory grounds' (hereinafter – Recommendations of the Prosecutor General, 2009). According to the Recommendations,

all criminal acts committed against persons, society, property, if they are motivated by negative, preconceived or stereotyped negative attitudes of the offender (culprit) regarding the racial, ethnic, national origin, religion, gender, sexual orientation of a particular individual or group of people, age, social status, disability, beliefs or views, generally fall into the specific category of criminal offences – hate crimes (para. 14).

Hate crimes (criminal acts) – are not only incitement against individuals or groups of individuals that are associated with a specific group as defined in criminal legislation, or individuals or groups of individuals reasonably or unreasonably associated with such groups, incitement of hatred, contempt or other humiliation against them, mental or physical violence against them, but also crimes against the property of such groups of people or their members, manifested in vandalism, various attacks against the centres of a certain group of people (community), houses of prayer, etc. (para.15).

Apparently, according to the Recommendation of the Prosecutor General, hate speech is considered to be one of these types of hate crimes.

This approach was not entirely consistent with the attempts of the international community and certain scholars to make a distinction between the two criminal acts. For example, the OSCE Office for Democratic Institutions and Human Rights (hereinafter – ODIHR) takes the position that the incitement of hate is not included in the definition of hate crimes. According to the ODIHR, a hate crime consists of two key elements: (i) contrary-to-law actions; and (ii) a motive for hatred. Since, apart from the motive of hate, the incitement to crime consists of a language element only which, by itself, is not recognised to constitute a criminal act, incidents of this kind are not recognised as hate crimes. On the other hand, the Organisation claims that inciting physical violence or threatening people because of their racial, ethnic, or other affiliation is still a hate crime (OSCE OHDIR, 2009). Indirectly, this opinion was endorsed by the International Association of Prosecutors (IAP). In its recommendations, the IAP claimed that prosecutors needed to understand the distinction between the two different types of criminal acts – hate crimes and hate speech. The IAP holds that even in countries in which hate crimes are not criminalised, attributing hate speech to hate crimes must be avoided due to the different level of dangerousness and nature of the two categories of acts (International Association of Prosecutors, 2014).

Representatives of the European Commission have expressed the position that hate crimes and hate speech are not identical acts, and therefore the protection of victims of each act has its peculiarities (European Commission, 2019).

The most recent research publications also take the view that the relationship between hate crime and hate speech cannot be viewed as a relationship between the whole and its part. On the contrary, these are two different categories of criminal acts for a number of reasons. Firstly, in cases of hate crimes a motive of hate is only one element in the composition of the act, whose presence or absence does not eliminate the dangerousness of the criminal act itself. Therefore, the practical activity of law enforcement institutions normally does not address the issue of whether a specific hate crime is dangerous (i.e. complies with the *ultima ratio* principle). In the case of hate speech, the hate of the offender and their prejudiced views are an essential component in applying criminal responsibility, because in the absence of the motive of hate a speech in itself is not a criminal act; quite the contrary, it is a value enshrined in the Constitution. Secondly, in the case of hate speech, when addressing the issue of criminal responsibility law enforcement officials normally face the issue of striking the right balance between two fundamental principles, i.e. equality and freedom of expression. Attempts to balance the two principles have led to the building of a concept of the gravity of a criminal act; this concept guides law enforcers in deciding whether the incitement to hatred has gone beyond the limits of the freedom of self-expression to the extent of justifying the imposition of strictest liability. The same circumstance also accounts for the third difference between the two criminal acts – the peculiarity of providing evidence. In the case of a hate crime, the

primary task is to prove the key criminal act, while hatred is referred to only as a subjective attribute. Meanwhile, in the case of hate speech, the primary task is to prove that the perpetrator's prejudice, bias, or hatred has gone beyond the limits of freedom of expression. This is a subjective attribute, however, that raises a number of challenges in practical application (Murauskienė, 2019).

On 30 March 2020, the aforementioned Recommendations of the Prosecutor General were replaced by a new version of the recommendations 'The Methodological Recommendations for Peculiarities of Organisation And Management of Pre-Trial Investigation of Hate Crimes and Crimes Related to Hate Speech'. The new recommendations reflect the positions that have been expressed by the international community and advocated for in more recent research papers. The new version of the recommendations takes the approach that all criminal acts committed against a person, society, or property, to the extent that they are motivated by the negative, prejudiced, or stereotyped stance of the offender (culprit), or stereotypes regarding the racial, ethnic, or national origin or citizenship of a particular individual or group of people, their religion, sex, sexual orientation, age, social status, disability, beliefs, or views, are to be divided into hate crimes and criminal offences (hereinafter – hate crimes), or hate speech (Prosecutor General's Office of the Republic of Lithuania, 2020).

In conclusion, hate crimes and hate speech are two different categories of criminal acts, and the principal criteria for demarcation between the two are the peculiarities of the attributes, the peculiarities of proving that a criminal act has been committed, and the peculiarities of proving the presence of hate as a motive – a subjective element. In the case of hate crimes, a motive for hatred is a subjective attribute, failing proof of which the criminal act is nevertheless considered grave and criminally punishable; besides, the motive of hate in this case can be incriminated as a circumstance aggravating the offender's responsibility. In the case of hate speech, unless the motivation of hate is established, speech as such is not considered to constitute a crime in the legal sense, and can be considered only to represent an inappropriate, incorrect, or unethical exercise of freedom of expression that does not incur the most severe, i.e. criminal, responsibility. Lastly, the two actions are different both in terms of their definition and, respectively, their legal regulation.

Hate crime constitutes all criminal offences motivated by hatred, bias, and/or prejudice against a group of persons distinguished by the attributes of age, sex, sexual orientation, disability, race, nationality, language, origin, social status, religion, belief, or opinions (Prosecutor General's Office of the Republic of Lithuania, 2020).

In Lithuania, the legal regulation of hatred-motivated crimes is based on the Framework Decision 2008/913/JHA on combating certain forms and expressions of racism and xenophobia by means of criminal law passed in 2008 by the European Council (hereinafter – Framework Decision; Murauskienė, 2019). Lithuania transposed the provisions of the Framework Decision on the criminalisation of hatred crimes in three ways by defining: the individual criminal acts; the motive of hate as an attribute qualifying the act; and hate as a circumstance aggravating responsibility.

Hate speech is the public dissemination (verbally, in writing or otherwise) of information (ideas, opinions, known misrepresentations) that mocks, despises, hates, incites to discriminate, or provokes to exercise physical violence against a group of people or a person belonging to the group on the grounds of gender, sexual orientation, race, nationality, language, descent, social status, religion, belief, or opinion (Prosecutor General's Office of the Republic of Lithuania, 2020).

Characteristically, such acts are committed using linguistic means, i.e. verbally or in writing by expressing certain statements or words using different symbols (signs and other objects) of an inflammatory or discriminatory nature (Prosecutor General's Office of the Republic of Lithuania, 2020). The definition uses the phrase 'in any expression', suggesting that the means are not necessarily words, but could also be video recordings, or any other

action or content – for example, a computer game showing people of a specific nationality being killed, or a meeting convened against a certain sexuality, etc. In Lithuania, the most common form of disseminating hate speech is by writing comments in the public space (for instance, comments on social media, such as Facebook, Instagram, etc.).

Hate speech is associated with incitement to hatred in the sense that it provokes hostility against certain people. The incitement of hatred against specific national, ethnic, or religious groups of people, or persons of a specific race, is normally manifested by the humiliation of personal dignity. For that purpose, misleading fabrications are often disseminated that include distorted or biased data about race, the history of an ethnic group or nation, their culture, traditions, psychological structure, faith, ideas, events, monuments, and documents that constitute national or religious values. These fabrications can pollute and offend an ethnic or denominational group or some of its members by distributing data concealing mockery, disgust, or contempt towards such individuals. This kind of information adversely affects not only a certain group of persons, but also the wider society with a prevailing atmosphere of insecurity; it triggers a desire to defend one's interests against allegedly strange and dangerous immigrants (Balsiūnaitė, 2016).

The responsibility for any actions inciting hatred is provided in Chapter XXV of the Criminal Code (hereafter – CC): 'Crimes and misdemeanours against a person's equal right and freedom of conscience'. The objects of the relevant Chapter of the CC are the rights and equality of groups of individuals and their members, irrespective of their gender, sexual orientation, race, nationality, descent, social status, religion, convictions, or views. In other words, the protection of the objects of such criminal acts allows the person to belong to a certain minority or another vulnerable societal group, and freely act in the society without being afraid of the adverse consequences potentially arising as a result. Additional objects are the security of the society, human life, health, and dignity.

Article 170(1) of the CC provides for criminal responsibility for a person who, seeking to disseminate, has produced, acquired, sent, transported, or retained items that mocked, despised, hated, or incited to discriminate against a group of people or a person belonging to it on the grounds of age, gender, sexual orientation, disability, race, nationality, language, beliefs, or views, or which incites violence or the violent physical treatment of such a group of people or a person belonging to it, or was proliferating such items. Para. 2 of the Article has, in practice, been applied much more often, and provides for criminal responsibility to a person who publicly incites violence or the physical violent treatment of a group of persons or a person belonging thereto on the grounds of sex, sexual orientation, race, nationality, language, descent, social status, religion, convictions, or views. Thus, the intended act can be manifested in one or several alternative actions: (a) ridiculing a particular group or a person belonging to it; (b) stigmatising them; (c) inciting hatred against them; and (d) inciting discrimination against them.

The ECtHR has ruled regarding the criminalisation of such verbal assaults by stating that incitement to hatred does not necessarily require incitement to commit a certain violent or other such criminal act. Attempts to insult, ridicule, or slander certain sections or groups of the population are sufficient for public authorities to prioritise the fight against racist statements in respect of irresponsible freedom of expression, which violates the dignity and even security of these sections or groups (*Feret v. Belgium*, 2009; *Cumpana and Mazare v. Romania*, 2004).

Article 170(3) of the CC provides for the criminal responsibility of a person who was publicly inciting violence or calling for the violent treatment of a group of people or a person belonging to such a group because of their age, sex, sexual orientation, disability, race, nationality, descent, social status, beliefs, religion, or views, or who financed or otherwise supported such an activity. Incitement to violence or physical violent treatment involves a direct or indirect encouragement to use physical or mental violence (kill, injure, etc.; Judgment of Vilnius Regional Court of 24 May 2016 in Criminal Case No. 1A-35-209-2016).

When qualifying acts according to Article 170 (2 and 3) of the CC, *publicity* as a method of committing the act is a mandatory attribute of a criminal activity (Judgment of the Supreme Court of Lithuania of 1 March 2018 in Criminal Case No. 2K-91-976/2018). On the other hand, the attribute of publicity in the context of such acts is a narrower concept than in the case of a violation of public order, in which case a public place is considered to be any place that can be accessed by other persons. In the case of the actions being analysed, it is necessary to establish that any of the public discriminatory or insulting statements or invitations to violence of the offender were intended to directly affect specific readers or listeners – i.e. to incite them against a group of persons or a person belonging to the group on the basis of sex, sexual orientation, race, nationality, language, descent, social status, religion, belief, or views – and to provoke hatred, to seek to build contemptuous and discriminatory opinions, or to encourage the use of physical or mental violence against such a demographic.

According to Article 170^2 (1) of the CC, criminal responsibility is provided to a person who publicly condones, denies, or grossly trivialises the crimes of genocide, war crimes, or other crimes against humanity recognised under the legal acts of the Republic of Lithuania or the European Union, or the caselaw of the courts of the Republic of Lithuania or international courts, where this is accomplished in a manner which is threatening, abusive, insulting, or which disturbs the public order. Additionally, criminal responsibility is provided to a person who publicly condones, denies, or grossly trivialises: the aggression perpetrated by the USSR or Nazi Germany against the Republic of Lithuania; the crimes of genocide, war crimes, or other crimes against humanity committed by the USSR or Nazi Germany in the territory of the Republic of Lithuania or against the inhabitants of the Republic of Lithuania; other grave or serious crimes committed during 1990–1991 against the Republic of Lithuania by the persons perpetrating or participating in the perpetration of aggression against the Republic of Lithuania; or grave crimes against the inhabitants of the Republic of Lithuania, where this is accomplished in a manner which is threatening, abusive, insulting, or which disturbs the public order.

The case law of the Supreme Court noted that according to Article 170^2 of the CC, criminal responsibility is applied not only for denial or gross belittling of the crimes referred to in the disposition, but also for denying or grossly trivialising the aggression of the USSR and Nazi Germany against the Republic of Lithuania, or the endorsement of such facts (Judgment of the Supreme Court of Lithuania of 22 January 2013 in Criminal Case No. 2K-7-102/2013).

Regarding the criminalisation of such actions, the ECtHR has held that a 'remark directed against the Convention's underlying values' is removed from the protection of Article 10 by Article 17 of the ECHR (*Perinçek v. Switzerland*, 2015). Such a case may be related to the denial or justification of international crimes (*Garaudy v. France*, 2003; *Witzsch v. Germany* [No. 2], 2005). However, Article 17 is, as recently confirmed by the ECtHR, only applicable on an exceptional basis and in extreme cases when it is (directly) clear from the outset that the right to freedom of expression was used for purposes contrary to the values of the Convention (*Perinçek v. Switzerland*, 2015).

Denying, tolerating, or trivialising genocide, war crimes, or crimes against humanity is one of the types of incitement of hatred. Denial of the holocaust is a specific racial category of self-expression, consisting of two key aspects: (i) denial or minimisation of crimes against humanity; and (ii) incitement of hatred against the Jewish community. Furthermore, denial of clearly established historical facts such as those of the Holocaust may not be considered to constitute historical research seeking historical truth. The actual object in this case was to rehabilitate the Nazi regime and accuse the victims of falsifying history. Disputing the existence of crimes against humanity was, therefore, one of the most severe forms of racial defamation and of incitement of hatred towards Jews (*Garaudy v. France*, 2003).

The introduction of such attributes in the disposition of the Articles of the Special Part of the CC providing for criminal responsibility for hate speech, as well as collision between the principle of equality and the right to self-

expression when assessing the content and the gravity of the statements, make the legal assessment of hate crimes in judicial practice quite a challenge. Crimes of hate speech are committed by trespassing the limits of the freedom of self-expression, therefore it is extremely difficult to determine at which point a person is still properly exercising their right and where it turns into hate speech that is dangerous from the viewpoint of criminal law. In this context, it is essential to properly define the criteria for distinguishing freedom of expression from hate speech crimes, i.e. to determine the point at which freedom of expression ends and the equality of persons begins. Therefore, the following section of the paper will provide an analysis of the key trends in national and international case law on the exercise of the separation of freedom of expression from speech inciting hatred.

3. Hate speech and the right to self-expression

Hate speech, as a form of violation of the right to equality, is directly linked to trespassing the limits of freedom of expression. In a general sense, in both national and international legislation freedom of expression is defined as the right to freely express one's opinions, thoughts, and beliefs, and to freely collect, receive, and communicate such information and ideas. Exercising freedom of expression also presumes an obligation to avoid, as far as possible, expressions that are gratuitously offensive to others and thus are an infringement on their rights (*Gündüz v. Turkey*, 2003).

According to the Constitution of the Republic of Lithuania, the freedom to express one's beliefs and disseminate information also means that the legislator must put in place legal regulation such that any incitement to national, racial, or social hatred, violence, discrimination, slander, or disinformation seeking to attempt to substantially deny relevant constitutional values be prosecuted as a criminal offence, and be held legally liable as a criminal act (Ruling of the Constitutional Court of the Republic of Lithuania of 8 July 2005).

According to the ECHR, everyone has the right to freedom of expression. This right shall include the freedom to hold opinions and to receive and impart information and ideas without interference by public authority, regardless of frontiers (Article 10). The judgments of the ECtHR highlight that this freedom applies not only to 'information' and 'freedoms' that that are accepted favourably, but also to those that are insulting, shocking, or disturbing. On the other hand, the freedom of expression is not absolute, and the trespassing of its limits that is related to the incitement of hatred may and has to be punishable according to criminal law. When assessing the legality of restriction of the freedom of expression, the ECtHR considers the following three criteria: (i) whether the restriction is prescribed by law; (II) whether the restriction has been put in place seeking a legitimate objective; and (III) whether the restriction is necessary in a democratic society. The ECtHR interprets the restrictions in a narrow sense of the word, while the law is interpreted broadly (Macovei, 2004).

The application of criminal responsibility for incitement to hatred is consistent with the permissible restrictions on the freedom of expression because: (i) it is prescribed in criminal law; (ii) it has the legitimate aim of protecting vulnerable groups against incitement to hatred, and is put in place with a view to defending the values enshrined in the Convention such as tolerance, social peace, etc. (*Norwood v. The United Kingdom*, 2004); and iii) the case law has established clear criteria for assessing whether a restriction on freedom of expression is necessary in a particular case. In national case law, these criteria are assessed from the perspective of the concept of the gravity of a criminal act *(*Judgment of the Supreme Court of Lithuania of 1 March 2016 in Criminal Case No. 2K-86-648/2016). The gravity of a criminal offence of hate speech makes it possible to pursue a reasonable application of criminal law measures without exceeding the guidelines put in place according to the *ultima ratio* doctrine, according to which criminal responsibility must apply only in the cases of the most severe and grave violations of the law. Those criteria are discussed below.

The context. One of the most important aspects considered by the courts is the social, historic, political, and other context in which hate speech was made. The ECtHR has held that the more tense the background, the more

dangerous the hate speech, making the application of the strictest liability justifiable (*Perinçek v. Switzerland*, 2015). For instance, when hate speech crimes are committed by certain individuals of radical views, on occasions of celebrations important for marginal groups, or by posting online comments about certain events that are specifically important for the society, it is highly likely that the requirements for language legitimacy have been violated.

The importance of the context has been also emphasised in Lithuanian case law. For example, by exonerating an accused individual who was inciting hatred against the LGBT community via their comments on a news portal, the Supreme Court of Lithuania held that 'the overall social background and the overall context of the commentary considered in the Case are not that tense that would justify any more stringent restrictions upon the exercise of the freedom of expression, and the application of criminal liability as an ultima ratio measure' *(*Judgment of the Supreme Court of Lithuania of 1 March 2016 in Criminal Case No. 2K-86-648/2016).

The statement dissemination method. The method of disseminating statements can significantly increase, or on the contrary mitigate, their gravity. The ECHR has previously held that, in light of its accessibility and its capacity to store and communicate vast amounts of information, the internet plays an important role in enhancing the public's access to news and facilitating the dissemination of information in general. The anonymity of internet users can facilitate the free flow of ideas and information. At the same time, the ease, scope, and speed of the dissemination of information on the internet, and the persistence of the information once disclosed, may considerably aggravate the effects of unlawful speech on the internet compared with traditional media (*DELFI AS v. Estonia*, 2013).

Following the case law of the ECtHR, Lithuanian courts adopted a very clear rule, according to which trespassing the limits of freedom of expression using the internet or other means of dissemination shall in all cases be considered more dangerous due to the scale and persistent nature (survival) of the information thus disseminated (Judgement of the Vilnius Regional court of 24 March 2016 in Criminal Case No. 1A-335-209-2016).

For instance, 'The ease, scope, and speed of the dissemination of information on the internet, and the persistence of the information once disclosed, may considerably aggravate the effects of unlawful speech on the internet compared to traditional media. Dissemination of such information on the internet increases the gravity of such acts' (Judgment of Vilnius Regional Court of 24 May 2016 in Criminal Case No. 1A-335-209-2016). 'Furthermore, any commentaries inciting violence or hatred on the internet, the posting of which may be promoted by the anonymity of the internet users, and which due to the peculiarity of the internet can be read by a huge number of people, are considered dangerous and criminally punishable, and in particular when such commentaries are posted in relation to articles on the most popular websites (one of those is www.15min.lt)' (Ruling of the Supreme Court of Lithuania of 1 March 2016 in the Criminal Case No. 2K-86-648/2016).

Personality of the author of the statements. In each case, when considering the limits and restrictions on freedom of expression, in addition to the context and content of the speech the ECtHR assesses the personality of the author (whether they are popular, well known, a politician, a blogger, etc.)

While freedom of expression is important for everybody, it is especially so for an elected representative of the people: they represent the electorate and defend their interests. However, the Court has previously reiterated that it is crucial for politicians, when expressing themselves in public, to avoid comments that might foster intolerance. The impact of racist and xenophobic discourse has been magnified in an electoral context, in which arguments naturally become more forceful (*Feret v. Belgium*, 2009).

It should be noted that in this respect the case law of Lithuania does not fully correlate with the position of the ECtHR. In one case, when responding to the arguments of a convict that they should not be prosecuted under Article 170 (1) of the CC for proclamations opposing joining the European Union, NATO, and the euro zone, the

Court of Appeals stated that, had they been a politician, their responsibility would have been smaller: 'This objection to Lithuania's integration into the EU, NATO, and the introduction of the euro would still be understandable if Ž.R. were a member of a political party, participated in elections to the Seimas or municipal councils, and in a politically correct form expressed criticism of the current situation in Lithuania' (Judgment of 26 February 2018 of the Klaipėda Regional Court in Criminal Case No. 1-11-361/2018). It may be concluded that, in the judgements of national courts, politicians can enjoy broader limits to their self-expression, which does not fully match the case law of the ECtHR (e.g., see *Feret v. Belgium*, 2009).

As has been mentioned earlier regarding the peculiarities of the case law in Lithuania in applying criminal responsibility for incitement to hatred, the main criterion referred to by the courts is the severity of the act. This criterion covers the other sub-criteria already formulated in the case law of the ECtHR. Furthermore, apart from the criteria referred to earlier, the courts identify other criteria defining the gravity of an act, such as the systematic nature of exceeding the limits of freedom of expression and the probability of actual consequences of such acts.

When providing reasoning for the latter consideration, in most cases the courts limit themselves to stating an actual threat to protected values, without specifying the indications. For instance:

> When recognising or refusing to recognise whether certain public statements constitute incitement against any nation, or a national, racial, ethnic, religious or another group of people, it is necessary to establish the validity of the threat they may pose to the values protected by criminal law. This presupposes that a conclusion statement of an offensive, derogatory nature is not sufficient to give rise to criminal responsibility under Article 170 (2) of the CC. To become criminally punishable, the statements must contain a specific direct or indirect incitement to hatred or discrimination, which could cause direct actual threat to the object protected by criminal law. The evidence in the present case allowed a conclusion that these circumstances were established, and the judicial decisions provided sufficient arguments that the actions of V.L. were not occasional or random, but V.L. was acting systematically by publishing extensive texts and making public comments, fully understanding the danger of their actions and seeking to provoke a negative public attitude towards Jewish people, homosexuals, and conservative and liberal parties, and was mocking and despising them (Judgment of 13 March 2018 of the Supreme Court of Lithuania in Criminal Case No. 2K-91-976/2018).

An analysis of the case law of national courts allows for the conclusion that the intensity of illegal actions, which is often manifested by the number of comments posted, the duration of the illegal actions, and their intensity show not only the danger of a specific person's actions, but also the purposefulness of their intent:

> It should be noted that the severity of V.Ž.'s actions is further exacerbated by the consistent and persistent nature of their actions (they were convicted for posting 13 entries online), the extended duration of such activity (the posts published in the period from 30 July 2012 until 12 February 2014), making purposeful statements against the community of believers, and seeking to mock and despise them (Judgment of 8 July 2016 of Klaipėda Regional Court in Criminal Case No. 1A-209-361/2016).

> Besides, there was only one short and rather unethical statement in the public online space in respect of which the subjective features of the act, i.e. a direct specific intent of the acquitted person to incite internet users reading their comments against homosexuals, to promote hatred or discrimination against them. (Ruling of 10 January 2019 of the Kaunas Regional Court in Criminal Case 1A-131-579/2019).

> The courts have provided extensive arguments regarding the intent of R.P., in its Ruling the Court of Appeals, specifically drawing attention to certain introductions that the convict was using when signing their commentaries, such as 'to Russian suckers', 'Russian Fascists' that clearly demonstrate their desire to publicly mock, despise, discriminate, call to violence, etc. Furthermore, as was mentioned earlier, R.P. had

written as many as 15 commentaries online, which proves that their actions were not random or accidental, but were rather premeditated and deliberate (Judgment of 3 October 2017 of the Supreme Court of Lithuania in Criminal Case No. 2K-206-693/2017).

In the long term, a rule was established in Lithuanian case law according to which one isolated comment on the internet exceeding the limits of the freedom of expression should not be subject to the most stringent form of liability (Judgment of 10 January 2019 of Kaunas Regional Court in Criminal Case No. 1A-131-579/2019).

This rule was partially rebutted by the judgment of the ECtHR in *Beizaras and Levickas v. Lithuania* at the beginning of 2020, which was extremely significant for Lithuania, in which the Court concluded that Lithuania had breached as many as three Articles of the Convention (13, 14, and 35). The case concerned a situation where two homosexual men posted a picture of them kissing to their Facebook page, and received countless negative comments including those calling for physical violence against them. The pre-trial investigation authorities, as well as the courts hearing the appeals, concluded, among other arguments, that in order for a person to be prosecuted under Article 170 of the CC, their actions must be of a systematic nature. Having assessed the whole situation and the arguments presented by the national courts, the ECtHR concluded that even a single hateful comment by the Appellant on the Facebook page, especially containing calls to 'kill' homosexuals, should be taken seriously. This is even further confirmed by the fact that the picture immediately 'went viral', and received more than 800 comments. The Court held, *inter alia*, that the case concerned open calls and encouragement to attack the physical and mental integrity of the appellants (in this respect see Decision of 7 May 2019 in *Panayotova and others v. Bulgaria*, paras. 58 and 59, with other references), against which only efficient criminal-law mechanisms can ensure adequate protection (see para. 111 of the Decision). This protection is provided in Article 170 of the CC and must be enforced in such cases.

Relatively little time has elapsed since the ECtHR passed the judgment, so no significant changes in case law have yet been observed. However, there is no doubt that this judgment and the motives presented in it will correct one of the characteristics of hate speech that has been so far relied upon, i.e. its systematicity.

4. Proving online hate speech by means of electronic evidence: key legal instruments for receiving (transmitting) it in cross-border cases

The report of the European Commission against Racism and Intolerance on Lithuania indicated that 'In Lithuania, hatred is often incited in cyberspace through online comments, blogs, social networks, and other fora' (European Commission against Racism and Intolerance, 2016). Therefore, investigations into hate crimes often require rapid access to electronic data in order to be able to initiate criminal prosecution and/or identify offenders.

Online services can be provided from any country in the world. Furthermore, the information (data) 'that users generate by means of new ICTs is, however, typically under the control of private companies which are often established in another jurisdiction and/or store data outside the investigating country' (Robinson, 2018). Therefore, when investigating criminal acts regarding incitement to hatred in cyberspace, national law enforcement institutions increasingly encounter cross-border situations, where electronic data (evidence) must be received from/transferred to other EU Member States or third countries.

In Lithuania, in order to initiate a pre-trial investigation and/or identify the suspected offender any investigation into incitement of hatred in cyberspace often requires the identification of the data regarding the subscriber (Navickienė & Miliūnė, 2020). The data on the subscriber is, in most cases, required in cross-border cases throughout the EU (Sippel & Melo, 2019).

When electronic data (evidence) or electronic service providers are located in another country, the parties can rely upon a number of pre-existing legal cooperation mechanisms for the transmission and recognition of evidence. The EU-wide instruments regulating this area are the mutual recognition mechanisms, now based upon the European Investigation Order Directive; mutual legal assistance (MLA) mechanisms (Proposal for a Regulation of the European Parliament and of the Council on European Production and Preservation Orders for electronic evidence in criminal matters COM/2018/225 final – 2018/0108 (COD)) are used in relation to third countries (hereafter – the Commission's proposal).

Although there are only a few EU legal instruments in the field of the transfer and recognition of evidence, the European Investigation Order (hereafter – EIO) is currently considered to be the most widely used instrument, optimally bringing closer the idea of the unimpeded recognition before a national court of any evidence collected abroad and transferred to another state (Jurka, 2019).

Directive 2014/41/EU of the European Parliament and of the Council of 3 April 2014 regarding the European Investigation Order in criminal matters (hereinafter – the EIO Directive) was adopted, seeking to develop a system of mutual recognition of investigative measures designed to collect all evidence, including electronic. For the purpose of enforcement of the investigative measure, the EIO Directive provides for different rules according to the type of electronic evidence. Firstly, regarding the data and the IP addresses of the subscriber (point e of Article 10(2), Article 11(1) of the EIO Directive). Secondly, regarding the previous flow data (*ex tunc*), depending on whether or not the historical traffic data was assessed in the Member State as coercive. In case the data is assessed as non-coercive, the same rules as those regarding the data subscriber can be applied. In opposite cases, i.e. where investigative measures are considered coercive, the general EIO procedures apply. Thirdly, regarding the data collected in real time, continuously, and over a certain period time (Article 28 of the EIO Directive). Fourthly, regarding the interception of telecommunications (Articles 30 and 31 of the EIO Directive). The EIO Directive also provides for the storage of electronic evidence, i.e. it puts in place provisional measures: 'The issuing authority may issue an EIO in order to take any measure with a view to provisionally preventing the destruction, transformation, removal, transfer, or disposal of an item that may be used as evidence' (Article 32(1) (Sippel & Melo, 2019).

Another important legal instrument is the Convention on Cybercrime of the Council of Europe (2001; hereinafter – the Budapest Convention). Cooperation according to the EIO Directive and the Budapest Convention in the area of electronic crime and electronic data (evidence) represents the so-called minimum level (Sipper & Melo, 2019). The most important provisions of the Budapest Convention in relation to the collection or transfer of electronic evidence are those on production order (Article 18), mutual assistance regarding provisional measures (Articles 29–30), and mutual assistance regarding investigations (Articles 31–34). The Budapest Convention requires parties to establish evidence provision orders for the receipt of computer data from service providers located in their territory, and subscriber data from service providers offering services in their territory. The proposal from the Commission also provides for an evidence storage order that is issued in cases when it is reasonably believed that computer data is subject to serious risk of loss or amendment.

In summary, it may be concluded that both the EIO Directive and the Budapest Convention have established a convenient system to obtain electronic evidence (Tosza, 2020; Maillart, 2019). However, not all states have joined the legal cooperation instruments discussed above, and therefore certain service providers do not fall within their scope. The EU has taken a number of legal initiatives to address the issue of obtaining and storing electronic evidence held, whether locally or by service providers established in another jurisdiction. On 17 April 2018, the European Commission published two proposals: 1) Proposal for a Regulation of the European Parliament and of the Council on European Production and Preservation Orders for electronic evidence in criminal matters COM/2018/225 final – 2018/0108 (COD) (European Commission, 2018b); and 2) Proposal for a Directive of the

European Parliament and the Council laying down harmonised rules on the appointment of legal representatives for the purpose of gathering evidence in criminal proceedings COM/2018/226 final – 2018/0107 (COD) (European Commission, 2018a).

The Explanatory Memorandum of the Commission's proposal for a Regulation of the European Parliament and of the Council on European Production and Preservation Orders for electronic evidence in criminal matters indicates that 'by introducing European Production Orders and European Preservation Orders, the proposal makes it easier to secure and gather electronic evidence for criminal proceedings stored or held by service providers in another jurisdiction'. The new instrument will not replace the EIO for obtaining electronic evidence but provides an additional tool for authorities. There may be situations, for example when several investigative measures need to be carried out in the executing Member State, where the EIO may be the preferred choice for public authorities. Creating a new instrument for electronic evidence is a better alternative than amending the EIO Directive because of the specific challenges inherent in obtaining electronic evidence, which do not affect the other investigative measures covered by the EIO Directive (European Commission, 2018b).

The following types of service providers fall under the scope of the Regulation: providers of electronic communications services; providers of information society services for which the storage of data is a defining component of the service provided to the user, including social networks to the extent that they do not qualify as electronic communications services; online marketplaces facilitating transactions between their users (such as consumers or businesses) and other hosting service providers; and providers of internet domain name and numbering services. The scope of the Regulation covers providers of electronic communications services as defined in the Directive establishing the European Electronic Communications Code. Traditional telecommunication services, consumers, and businesses increasingly rely on new internet-based services enabling inter-personal communications such as Voice over IP, instant messaging, and e-mail services, instead of traditional communications services. Therefore, the draft Regulation should apply to the following services in connection with the social networks, for example, Twitter, Facebook, and Instagram; instant messaging service providers facilitating content exchange, such as WhatsApp, FB Messenger, Telegram, Viber, and Skype (Jurka, 2019).

Both types of orders will only be able to be used in criminal proceedings starting with a pre-trial investigation and ending with a court decision or other ruling. The Commission Proposal envisages that both Orders can only be used in criminal proceedings from the initial pre-trial investigative phase until the closure of the proceedings by judgment or other decision. The Orders to produce subscriber and access data can be issued for any criminal offence, whilst the Order for producing transactional or content data may only be issued for criminal offences punishable in the issuing State by a custodial sentence of a maximum of at least three years, or for specific crimes which are referred to in the proposal and where there is a specific link to electronic tools and offences covered by Directive (EU) 2017/541 of the European Parliament and of the Council of 15 March 2017 on combating terrorism and replacing Council Framework Decision 2002/475/JHA and amending Council Decision 2005/671/JHA.

In summary, it may be concluded that the two legislative initiatives create, in essence, the principle of direct communication arising from the principle of mutual recognition applied in EU criminal jurisdiction. Different from the cases covered by EIO, the judicial institution issuing European Production Orders and European Preservation Orders will transfer the orders and the accompanying certificates directly to service providers or their designated legal representatives, and not to the competent law enforcement authority of the other Member State where the service provider is established. The measures are designed and put in place in order to facilitate international cooperation processes in criminal cases (Jurka, 2019).

In summarising the legal perspective on the transfer of electronic evidence in cross-border cases, it should be noted, however, that it still causes discussions both regarding the future application and regarding legal compliance with the principles of law (Stefan & González Fuster, 2018; Smuha, 2018; Jurka, 2019; Tinoco-Pastrana, 2020). In particular, this is because

'this approach effectively leads to the privatisation of mutual trust in Europe's area of criminal justice, which raises the second concern regarding the protection of fundamental rights. The Commission's proposal on e-evidence marks a fundamental shift in the scheme of co-operation in EU criminal matters, from a system of co-operation and communication between public (and mainly judicial) authorities, to a system of co-operation and communication between public authorities in the issuing state and private companies. The proposed system places undue responsibility on private providers to safeguard fundamental rights. Private providers do not enjoy equality with public authorities in terms of co-operation; this is evident by the very fact that they are subject to sanctions if they infringe their obligations under the Regulation' (Mitsilegas, 2018).

Conclusions

Criminal acts motivated by hatred are divided into hate crimes and hate speech that are manifested as information disseminated in any form (oral, written, action, etc.) targeting the most vulnerable groups in society; promoting hatred, discrimination, or bias against them; inciting ridicule, contempt, or discrimination; or exercising violence against such persons.

Hate crimes and hate speech are two different categories of criminal act, and the principal criteria for demarcation between the two are the peculiarities of their attributes and the peculiarities of proving the criminal act, which relates to proving the presence of the motive of hate as a subjective feature. In the case of hate crimes, the motive of hate is a subjective attribute, absent proof of which a criminal act is nevertheless considered grave and criminally punishable; besides, the motive of hate can in this case be incriminated as a circumstance aggravating the offender's liability. In the case of hate speech, unless the motive of hate is established the act is not considered to constitute a crime in the legal sense of the word, and can be considered to represent only an inappropriate, incorrect, or unethical exercise of freedom of expression that does not incur the most severe, i.e. criminal, responsibility.

When dealing with cases related to hate-speech, in seeking criminal responsibility for incitement to hatred courts face the problem of demarcating hate speech from a person's right to exercise their freedom of expression. When assessing whether a specific action that could have been undertaken to incite hatred should be criminally prosecuted, national and international courts take into account a number of aspects, such as the overall environment in which the information was spread, the author of the statements, the information dissemination method, the intensity (systemic nature) of the actions being considered, the resulting consequences, or the theoretical probability of such consequences appearing.

In Lithuania, most acts of hate incitement are committed online. Therefore, law enforcement authorities often need to receive or transfer electronic data (evidence) to or from other countries. Despite some practical challenges related to their implementation, the existing instruments for judicial cooperation under the EIO Directive and the Budapest Convention are considered highly functional platforms. However, not all states have joined these legal cooperation instruments, and therefore certain service providers do not fall within their scope of application. The proposal for Regulation on European Production Orders and European Preservation Orders can be considered an appropriate solution to this problem, despite concerns regarding the required innovations in the interaction between the public (law enforcement and judicial authorities) and the private sector according to the regulatory proposals.

NEW APPROACH TO DETERMINING THE ECONOMIC POTENTIAL OF RURAL AREA ON THE EXAMPLE OF THE SOUTH BOHEMIAN REGION OF THE CZECH REPUBLIC[*]

Abstract. The paper discusses a new approach to determining the economic potential of rural area on the example of the region of South Bohemia in the Czech Republic. The approach is based on a comprehensive economic model, consisting of four sub-models (SM). Such aggregate model is used as the basis for the analysis of regional economic potential. The SMs were defined by the Progressivity Index of the Economic Structure, Trend of the Economic Structure Index, Business Activity Rate and Recreation and Tourism Index. The mathematical-statistical method of Stepwise backward analysis was used as an analytical tool. During this stage, the data database from Ekotoxa was used. Practically, the first two SMs named were verified. Furthermore, the implementation of the results was designed and tested by the researchers. Two research objectives were fulfilled, namely the construction of summary and partial models, and the

---

suitability of the analytical method tested are verified. Practical knowledge to deal with the situation in the region of South Bohemia was also obtained. The positively influencing factors for the economic potential of the region include the trend of increasing the number of people with university education, public transport services on weekdays, nursery facilities and population density. Negative factors include the natives and availability of secondary schools with the Maturita exam and landscape fragmentation. Within the mathematical modelling, it is possible to simulate the positive and negative response of additional inputs to the tested factors.

Keywords: economic potential; rural space; Stepwise backward analysis; Summary economic model; Sub-model

1. Introduction

Economic potential (business potential in particular as its most important component) is described as a limiting factor for the rural area, its sustainability and development. In the rural areas, mostly the SMEs operate, and they are the backbone of every national economy within the European Economic Area (Kramoliš & Dobeš, 2020). Rural entrepreneurship is defined as entrepreneurial activities embedded in a distinctive environmental space, predominantly with local and regional scope, with a large spatial dimension, low settlement rates and often imperfect structures (Kalantaridis and Bika 2006b; Korsgaard, Muller, Tanvig 2015).

Another characteristic is related to the creation of new values, based on the use of resources from the environment (Razvanta 2019). It is a fact that the share of rural areas within the EU, and in the Czech Republic is between 60-70%. Despite such dominance in terms of acreage, there is not yet an exact anchoring of the definition of rural space in the valid legislation of the Czech Republic (similarly in some EU countries). The reason is the ambiguous and polarized space, as there are different rural regions. These regions have different development potentials (Perlín, 2010; Skála, 2017). Many authors agree that the definition of rural areas should be derived from the characteristics of rural business, which is still a decisive and also limiting factor for rural stability. Business activities are gaining in diversity by ensuring the diversification of the social and social climate. At the same time, however, they are severely restricted in rural areas in some regions (Korsgaard et al. 2015; Dubois 2016; Bosworth, Turner 2018).

In the countries of the European Union, the rural areas cover an area of approximately 1,928.7 km2, i.e. 42.3% of the geographical surface of the European Union. These areas are populated by 82 to 97 million citizens (World Bank, Eurostat). These data indicate that one in four citizens of this economic and political group lives in rural areas. Many of them are in the middle and lower property class (Barczyk, Musial, Zukovskis 2019, Anyakoha, 2019). Outside the EU, such situation is even clearer, especially in rural areas of developing countries (Ksoll, Lilleor, Lonborg, Rasmussen 2016). Worldwide rural business employs about 40% of the world's population (AgFunder 2017). This amount contributes to 30% of GDP in developing countries (Mayorova, Domzal, Gernego, Dyba 2019). On the contrary, in EU countries it is more than 60%. Therefore, understanding rural vitality and viability is an important research problem at the beginning of the 21st century.

Rural vitality is defined as an area where strong, active and inclusive relations between the citizens, private space, public space and civil society organizations co-operate in economic, social and environmental space. Due to the growth of urban agglomerations, interest in a certain type of rural areas is increasing, including the use of their

production areas. These production rural areas are becoming areas for housing, recreation of the urban residents, and also for the useful production capacity, as seen in many places in the Czech suburban countryside (Eimermann, Karlsson 2018).

The rural space of the Czech Republic went through a turbulent development in the last century. A major turning point came in 1989, when its historical mission, traditions, including crafts and small businesses returned to the Czech rural area. At the same time, however, negative tendencies, such as socio-economic inequality compared to urban regions started occurring (Blažek and Netrdová 2012). Such a negative trend is also relatd to a significant decline in the population from these peripheral, non-developing regions, in particular the outflow of professionally qualified and university-educated people (Ouředníček et al. 2011). Progressive activities, skilled work and university educated people are concentrated in dynamically forming metropolitan areas while rural areas are stagnant (Ouředníček et al. 2011; Hampl, Marada 2016) Business activities are disappearing from many rural settlements. Enterprises with predominant craft and agricultural production disappear or move to larger conurbations. Insufficient services and facilities are also apparent in the countryside. The frequency of public transport is decreasing. Job opportunities are limited, and the social and cultural activity of the population is declining (Korauš et al. 2020). However, these phenomena do not occur everywhere and to the same extent (Perlín et al. 2010; Novák and Netrdová, 2011; Jašková, 2019).

At the beginning of the 21st century, scientific work increased its importance, declaring the need to ensure sustainable development, stability and a suitable business environment for the SMEs in rural regions (Ammirato, Felicetti, Della Gala, Frega 2017; Lazikova et al. 2018; Mészáros, Divékyová, 2019; Mura, Kajzar, 2019; Mura et al. 2018; Horváth, Hollósy, 2019). The rural areas often face problems associated with reduced economic and development capacity. Furthermore, these areas are associated with lower profitability, low economic potential, and the development of community planning. (Horiuchi 2017; Steiner; Teasdale 2019; Azhaman; Petryshchenko 2019, Belas et al. 2016, Dobrovič et al. 2018, Dobrovič et al. 2016). As a result of the downturn of the traditional handicrafts in the country, the predominant incomes from non-agricultural sources are important. The share of agricultural income continues to decline, right now at a slower pace (Pastusiak 2017; Barczyk et al. 2019). This process is exacerbated by the outflow of young people from the rural areas (Bosworth, Turner 2018). For this reason, the development of the rural areas is one of the main objectives of the development policy of the European Union. However, there is still no single approach to its definition and measurement (Straka, Tuzova 2016; Milone, Ventura 2010). The traditional model used is based on the hypothesis that, in rural areas, agriculture, in general, is considered to be often the only and main source of income that helps to foster rural development (Singgalen et al. 2019; Seilerová 2019).

The region of South Bohemia is characterized by its incompactly distributed settlement structure and low population density in contrast to a relatively large area. Due to the absence of more large towns, the region of South Bohemia is perceived as an area with a high proportion of agricultural, forestry and fishing activities. The localization of the region falls mostly in the area of the south of Bohemia.

With its area of 10,056m^2 (of the total area of 12.8% from the Czech Republic), the South Bohemian region is the second largest, in terms of the population of 643,176 it is the 6th most populous region in the Czech Republic. The population density per square kilometre is 63.95. In terms of percentage of population living in small municipalities (classified up to 200 inhabitants), it is 4.3%, and compared to the number of these municipalities it is 37.4%, and 63.8% of the population living in the towns. Comparing the present character of settlement (population and landscape population, visual stability of settlements, density of settlements, etc.), character of agriculture (size of land, type of livestock buildings) and character of surrounding cultural landscape, South

Bohemia is defined as the rural region. The position and role of the South Bohemian countryside is quite significant on a nationwide scale as the rural character creates significant disparities throughout the region. During its operation, the region deals with the problems typical the rural area. This is mainly due to an imbalance in terms of the availability of some services, or not to a fully developed infrastructure. Especially in the peripheral parts of the region, but also in the border area, there are rural areas whose stability and development are limited by factors such as worsening and increasing transport accessibility, lower availability of job opportunities, public services including cancellations of post offices, schools, shops and low support for small and medium-sized enterprises, etc.

Effective, sustainable and feasible solution of rural space in terms of its prosperity and development presupposes knowledge of its regional (economic, business) potential (Orynbassarova et al. 2019; Selivanova-Fyodorova et al. 2019; Perlín, 2008). By Skála (2017), the development potential is a complex of possibilities providing preconditions for further development of the municipality and increase the quality of life of the inhabitants in the countryside (Sobczyk, 2014). Development potential can be seen as a certain impulse that will stimulate and accelerate development (Hoggart and Buller, 2016; Štefko 2019; Vlacseková 2019). Development potential is defined by disposition, abilities and capacities that will lead to a positive change from the current situation in the future (Leitmanová et al., 2012, Rák 2012). Identifying development potential, and identifying key development factors, is an important knowledge for properly targeting development activities and payment security (Korauš et al. 2019a, Korauš et al. 2019c, Kopencova 2020; Rajnoha et al. 2017). In theories of regional development, factors are divided into exogenous and endogenous. In practice, these factors are not fundamentally opposed; however, they rather complement each other. Exogenous approaches express initiated development from the outside, which is dependent on external incentives and interventions, especially by the state. On the other hand, endogenous approaches, where development cannot be achieved solely by support from above, they need to be based on the bottom approach (Chromý, Skála 2010; Chromý et al. 2011; Okanazu et al. 2019; Kijek, Matras-Bolibok, 2020), depend on local impulses and resources, initiative and active participation of local and regional actors. These interdependent and conditional potentials have different character and different influence on the development of rural space. (Bernard ed. 2011).

This paper focuses on the issue of determining the development, i.e. the economic potential, in the region.

2. Methods

The research used secondary data from Ekotoxa. The data were divided into four pillars (economic, social, infrastructure-institutional and environmental). In total, 602 municipalities in 17 local action groups of the South Bohemian Region were analyzed, except for towns with a population of over 25,000, i.e. all municipalities that may be part of a regional LAG. A total of 29 indicators were selected. The proposed and subsequently selected indicators were consulted by CzechInvest and some adjustments of the indicators were made by Ekotoxa.

Finally, four indicators were selected in the economic; seven indicators in the social pillar; eleven indicators in infrastructure; and seven indicators in the environmental pillar. The indicators were assigned codes from K101 to K407, see Table 1.

Table 1. Indicators of the pillars

KOD	Economic pillar	K304	Accessibility of the area by the public transport on Saturday
K101	Progressivity Index of the Economic Structure	K305	Accessibility of the area by A and major roads
K102	Trend of Progressivity Index of the Economic Structure	K306	Accessibility of railway stations
K103	Rate of Business Activity	K307	Residents living in permanently occupied dwellings connected to water supply, gas and public sewerage
K104	Natural Presumptions of Recreation	K308	Nursery school facilities
KOD	Social pillar	K309	Primary school facilities
K201	Population Density	K310	Accessibility of secondary schools with Maturita
K202	Aging of Population (increase of the number of senior citizens) – Aging index trend	K311	Accessibility of senior care homes
K203	Economic load index trend	KOD	Environmental pillar
K204	Natives	K401	Production capacity of land resources
K205	Trend in the growth of the population with higher education	K402	Ecological fragmentation
K206	Unemployment trend	K403	Share of water areas
K207	Czech citizenship	K404	Chemical status of surface water
KOD	Infrastructure pillar	K405	Soil visualization trend
K301	Accessibility of the area by the public transport on weekdays	K406	Forest hazard zones
K302	Accessibility of the area by the public transport on Saturday	K407	Trend of specific territorial emissions from stationary source
K303	Accessibility of the area by A and major roads		

Source: own processing

The analytical tool used was the Stepwise Backward Analysis, a method of backward step regression for the calculation of economic models of the region of South Bohemia. Using this method, the dependence of other factors on the economic pillar factors was tested with the aim of projecting the most optimal economic pillar model for the rural area of the region of South Bohemia.

The method of gradual regression is the method of finding the most appropriate model (the smallest number of independent variables, the highest quality prediction). The subject of the analysis is not to determine the order of variables (predictors) in terms of their entry into the model; this is a part of the algorithm of the program itself. The programme is used in two variants - forward and backward. A reverse variant was used, in which all predictors are included first and then gradually removed and their significance within the tested indicator is analysed.

The principle of gradual regression is that the regression model is built step by step by examining all the predictors in each step to determine which of them best describes the variability of the dependent variable.

Both the inclusion of the predictor into the model and its exclusion is done by sequential F-tests. The sequential F-test is based on the F statistic, which is the ratio of the increment of the regression sum of squares when the predictor is included in the model and the residual sum of the squares. If this statistic is greater than the value

called "F to enter", the predictor is included. If the F statistic is less than the value called "F to remove", the previously included predictor is excluded from the model.

After determining the variables into the model, the parameters of the linear regression function are estimated, and the quality of the regression is assessed by the determination index. Additional variables are gradually added to the model as the proportion of the explained variability of the magnitude increases.

Before the research, two research questions were formulated: The first one is related to the design of an economic model that would allow determining the economic potential of the territory; the second question focuses on finding and verifying a suitable analytical method for the proposed models. A partial objective was the real results of the research, in terms of usability and informative value for the users of results.

3. Results and discusion

3.1 Projection of the model for the analysis of regional economic potential

To analyse the economic potential of rural areas, a "Global Economic Model - GEM" is proposed consisting of four "Sub-Models - SM 1 to 4" used as a potential basis for the analysis of regional economic potential:
- Sub Model 1: Progressivity Index of Economic Structure (INXPES).
- Sub Model 2: Economic Structure Index Trend (TIES).
- Sub Model 3. Business Activity Rate (BAR).
- Sub Model 4: Recreation and Tourism Index (RATI).

Due to the limited extent of the paper, the analysis procedure for the Progressivity Index of the Economic Structure and the Trend of the Economic Structure Index are presented in full.

3.1.1   The index of progressive economic structure

The index of progressive economic structure (INXPES) is identified by the researchers as the decisive territorial index, determining the socio-economic differentiation of the regions in the Czech Republic. It is designed and constructed as a weighted sum of the proportion of the economically active enterprises in the primary sector, twice the proportion of the economically active in the secondary sector and three times the proportion of the economically active in the tertiary sector.

The algorithm of the method is that through its use, the explanatory variables are determined in the economic model of the regression function so that all the explanatory variables are initially included in the resulting model. In the next steps, the variable with the largest p value (i.e. the least statistically significant variable) is removed. This is done until an optimal regression model is found. Using the stepwise backward regression method, six explanatory variables are found that influence the progressive index of the economic structure. The resulting regression model is as follows:

$$Mp = \hat{y} = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6$$

Mp=$\hat{y}$- sample (empirical) regression function – complete model

Each β_i for each indicator in the table is labelled as *Estimate*s *Beta.*

The resulting regression function is as follows:

$$\hat{y} = 2{,}600 - 0{,}006x_1 + 0{,}006x_2 + 0{,}001x_3 - 0{,}014x_4 - 0{,}003x_5 + 0{,}188x_6$$

and:

$x_1 = K204$ The natives

$x_2 = K205$ Trend in the growth of the population with higher education

$x_2 = K205$ Accessibility of the area by the public transport on weekdays

$x_4 = K306$ Nursery school facilities

$x_5 = K308$ Accessibility of secondary schools with Maturita

$x_6 = K402$ Landscape fragmentation

The input data for the input factors x_1 to x_6 are analysed using the regression equation. The results of the analysis are shown in Table 2.

Source: own research

The authors use the following procedure to present the results of the analysis of the sub-models:
   a) *Assessment of the value of signification.*

By the results shown in Table 2, the value of signification is 0.000 (the value below 0.05), in the sample, so that there are strong relations between the variables.

b) *Intensity of multiple dependences in the tested model.*

The aim is to determine the variability of the analysed set of variables for the tested index. The intensity of multiple dependencies is characterized by a multiple correlation coefficient, which is the square root of R-squared adjusted (see the table above).

$$r_B = \sqrt{0,286} = 0,534789$$

By the value of R-squared adjusted (the adjusted index of determination) shown in Table 2, it is revealed that the combined action of all six explanatory variables (natives, the trend of population growth with tertiary education, public transport on weekdays, nursery facilities, availability of secondary schools with Maturita and ecological fragmentation) 28.6% variability of the explained variable of the progressive index of economic structure is explained.

c) *Determining the directions of action of the test factors (positive and negative effects on the test index).*

As shown in Table 2 (Beta column), the following factors influence the economic structure of the South Bohemia: Trend in the growth of the population with higher education, Transport services of the territory by public transport on weekdays, Nursery facilities and Landscape fragmentation. Regarding landscape fragmentation, the significance is not considerable and therefore there is no indication of the relation to the tested index. However, by the authors it also expresses the limiting value for the progressivity index of the economic structure. The factor of the natives and the availability of secondary schools with Maturita are negative.

d) *Practical (point values) expression of a benefit and loss for each factor tested.*

As shown in Table 2 (Model, Beta and Significance factors), it is possible to carry out a point-value or financial calculation (assuming the value of one point is defined, the authors are currently working towards the methodology within the proposed method).

The resulting regression model revealed that increasing the trend of increasing the number of inhabitants with higher education, transport services of the territory by public transport on weekdays and Nursery school facilities by one point increases the progression index model by 0.006, 0.001 and 0.014 points, assuming that the values of the other variables are unchanged. The opposite trend occurs in the factors of the natives and availability of secondary schools with Maturita - an increase of one point decreases the value of the index of economic structure of the region by 0.006 and 0.003 points.

For the landscape fragmentation factor, where the Significance Value is 0.046, benefit modelling is irrelevant as there is no relation to the other factors.

e) *Description of the factors by the results.*

- The Natives:

The natives are related to the share of inhabitants born in the municipality of habitual residence. They usually have a stronger relationship with their native village. Also, the life in a micro-region offers certain life benefits for inhabitants born there; however, it might not be so attractive to other residents that moved in. It is assumed that a higher proportion of the natives is a sign of some developmental stagnation and higher degree of peripheral nature.

- Trend in population growth with higher education:

University educated population and its trend is an important indicator defining the quality and quantity of human resources, influencing the employment in the territory, development of the business environment, overall economic development of the territory, and also the functioning of the municipalities. In the area of human resources, the South Bohemian region is facing a shortage of labour, and a long-term trend of increasing the

921

number of job applicants not meeting the demands of the employers, including the university graduates. The main problems are mostly related to the decreasing interest in technical disciplines and inconsistency between the employers' requirements and the profiles of school graduates.

The region of South Bohemia, in comparison with the other regions, is rated as the average. The areas near České Budějovice (such as Hlubocko-Lišovsko, Netolicko) report the best situation. To the contrary, the areas of střední Povltaví, Blatensko, Bechyňsko (LAG Lužnice) are rand as the worst.

- Transport services of the territory by public transport on weekdays

The indicator defines the quantity of bus and railway connections, and the level of transport services to the municipality from other territories, otherwise defined as transport accessibility. The number of public transport connections in the region of South Bohemia is one of the lowest in the Czech Republic and it is 42 connections (14th among all the regions). The lack of public transport services is particularly difficult in small municipalities located on the outskirts of the region. On the other hand, the regions around the regional town of České Budějovice (LAG Hlubocko-Lišovsko, LAG Růže, LAG Pomalší) report excellent transport services.

Transport services are also defined using the term transport accessibility. Transport accessibility is understood as a structural morphological feature of the communication network, as communication availability of nodes. Accessibility is understood as the ability of a territory to be reached and to reach various other sites. Availability significantly affects the spatial organization and structure of the cultural landscape. Increasing availability regulates the economic development of the settlements. Higher number of connections in the municipality determines higher accessibility of the municipality, indicated as attractiveness and emtivity (potential of the settlements to create interactions) of the territory.

- Nursery school facilities

Most nursery school facilities are located in larger towns and centres of municipalities with extended powers. Most nursery schools are located in large towns with the population over 10,000 inhabitants. On the other hand, the lowest number of nursery schools is in municipalities with less than 300 inhabitants. It was also verified that the municipalities with the population over 1,000 occupy 64% of the total number of the nursery schools in the region and are better equipped with pre-school education compared to the municipalities with a lower population. There is sort of a direct and proportional link, as a larger population means more children and consequently a higher demand for pre-school facilities.

- Accessibility of secondary schools with Maturita

In the region of South Bohemia, more than half of the secondary technical schools and vocational schools are concentrated in district towns. Those interested in studying here have a greater choice of study and teaching fields. However, many schools are also located in other towns, and their focus often results from the economic and geographical conditions and traditions of the region. The largest number of pupils is in general preparation, i.e. the grammar schools, the second largest group of secondary school classes is in the field of Mechanical Engineering and Manufacturing, and in proportion to the other groups their number is increasing steadily, especially in recent years. This is largely due to a wide choice of the support for technical education, followed by agriculture and forestry and gastronomy, hotel and tourism. The ranking of the first three places has been the same for the third year.

- Landscape fragmentation

With regard to the environmental character of the region, fragmentation of the landscape is generally a negative factor, assuming that a stable landscape is the basis for healthy and sustainable economic growth of the territory. One of the main reasons for landscape fragmentation is primarily related to the construction and use of linear transport infrastructure, in addition to agricultural production and urbanization. This includes roads, railways and waterways. Linear routes divide the territory they pass through into smaller and smaller parts, fragmenting the area, affecting the life in the landscape negatively. Fragmentation of the landscape is related to nature conservation and it is also irreplaceable for the life of humans in rural space and for the stability in the arras. Fragmentation barriers in nature reduce the landscape potential for recreation and the permeability of the landscape to allow free movement. The landscape divided into small segments by settlements and transport, with consequent noise and emission load, is losing the potential. In summary, the fragmentation of the landscape in the region of South Bohemia will grow in the future by building a motorway, road and rail network, urbanization and construction of buildings for business activities; thus, a negative impact on the economic potential of the territory is expected.

3.1.2 Economic Structure Index Trend

Economic Structure Index Trend (TIES) is the second partial model tested in the total model. The trend follows the analysis of changes in the sectoral structure of employment in terms of the current level and its future potential. Using the stepwise backwards regression method, two explanatory variables are selected that significantly affect the progressive index of the economic structure. The resulting regression model is as follows:

$$Mp = \hat{y} = \beta_0 + \beta_1 X_1 + \beta_2 X_2$$

Mp=$\hat{y}$-sample (empirical) regression function – complete model

Each β_i for each indicator in the table is labelled as *Estimates Beta.*

$$\hat{y} = 0{,}186 + 0{,}000x_1 - 0{,}242x_2$$

$x_1 = K201$ Population density

$x_2 = K402$ Landscape fragmentation

The input data for the input factors x_1 and x_2 are analysed using the regression equation. The results of the analysis are shown in Table 3.

Table 3. Economic Structure Index Trend

Model Summary

Source: own research

The following procedure is used to present the results of the analysis of the sub-model:
  a) *Assessment of the value of signification.*

As revealed by the significance of 2e-04 (value below 0.05), there are strong links of the variables in the sample.
  b) *Intensity of multiple dependences in the tested model*

The intensity of multiple dependencies is characterized by a multiple correlation coefficient, which is the square root of R-squared adjusted (see the table above).

$$r_B = \sqrt{0,024} = 0,1549$$

As revealed by the value of R-squared adjusted (adjusted index of determination), the joint action of two explanatory variables (settlement density and ecological fragmentation) explains 2.4% of the variability of the explained variable of the economic structure index trend.

  c) *Determining the directions of action of the test factors (positive and negative effects on the test index).*

The Population Density Factor has a positive effect on the trend of the economic structure index. The opposite, i.e. negative, direction of action is indicated for the landscape fragmentation factor.

  d) *Practical (point values) expression of a benefit and loss for each factor tested.*

The regression model also suggests that increasing the population density by one point will not change the trend of the economic structure index, although a positive effect is assumed if the other variables are unchanged. The opposite trend, i.e. the negative effect on the Index, is reported for the factor of landscape fragmentation, as an increase of this factor by one point results in a decrease in the value of the trend of the economic structure index of the region by 0.242 points.

  e) *Description of the factors by the results.*

The linear model proves a dependence on population density and landscape fragmentation. Population density usually indicates the attractiveness of the territory, including sufficient cultural development in the region. The sufficient amount of human resources also predicts a certain direction in land use. The possible negative effects of this factor include the case of extreme population density, which would be in conflict with the potential economic capacity of the territory, which is not possible in the region of South Bohemia.

Increased value of the landscape fragmentation is usually related to intensive development of residential, industrial and transport infrastructure, greater urbanization of the territory, and the division of natural localities, which may have a negative impact on the attractiveness of the area and on its ecological stability. Migration barriers are landscape structures that prevent the free movement of animals. In terms of the calculation of the fragmented area, the following groups were selected as the main barriers: motorways and expressways, roads I, II. III. class, double - track and other railways. Therefore, this indicator is also defined by the fact that the higher the degree of fragmentation of the territory, the better, high-quality and faster transport service to the region. The least fragmented area is the area of Trhové Sviny and Nové Hrady (LAG Růže), the whole area of Šumava (LAG Šumavsko and LAG Rozkvět) and LAG Blanský les and Netolicko.

Similarly, the remaining two partial models were tested, in particular the business activity rate and recreation and tourism index.

4. Results and Discussion

Before the research, two research questions were formulated: The first one is related to the design of an economic model that would allow determining the economic potential of the territory; the second question focuses on finding and verifying a suitable analytical method for the proposed models. A partial objective was the real results of the research, in terms of usability and informative value for the users of results. The following par of summary and recommendations discusses the fulfilment of the above-mentioned objectives.

Before testing the comprehensive economic model, the structure of the economic pillar was proposed, consisting of 31 indicators reflecting the specificities of the regions in the Czech Republic. The final scope can be determined only after the general application in all the regions in the Czech Republic. However, their number and structure are sufficient for the region of South Bohemia.

Prospectively, there is a need to precisely define the procedure for collecting relevant secondary and primary data, to specify the minimum extent of the reference period, to define the qualitative aspect of the data base and the form of data processing prior to the actual use for the analyses.

The proposed comprehensive economic model, consisting of four sub-models (Progressivity Index of Economic Structure, Trend of Economic Structure Index, Business Activity Rate and Recreation and Tourism Index), is suitable for expressing the current and predicted development capacity of the relevant territorial unit. The first sub-model is considered decisive in terms of socio-economic differentiation of individual regions within the state. The index of progressivity of the economic structure is described as a decisive territorial index in terms of regional differentiation, its construction (weighted sum of the share of economically active enterprises in the primary sector, double the share of economically active in the secondary sector and three times the share of economically active in the tertiary sector) is appropriate. The second index - The trend of the index of economic structure progressivity - is based on the data base of the development trend and it follows the analysis of changes in the sectoral structure of employment in terms of the current level and its future potential. The construction of this index also provides appropriate outputs; however, the range of analyzed factors (so far, there are two - population density and landscape fragmentation) might increase.

The proposed procedure for the presentation of the results of the mathematical-statistical analyses is the first approximation of the solution with the assumption of its gradual refinement and completion. Regarding the structure of the output analytical report, the proposed procedure of evaluation of the results is evaluated in the following way: assessment of the signification value, intensity of multiple dependencies in the tested model, determination of directions of influence of the tested factors (positive and negative influence on the test index) benefits and losses of the factors and characteristics of the analyzed factors from the point of view of their suitability for management, administrative bodies and business practice.

In addition to the design of a comprehensive economic model and its four sub-models, another research objective was to design and validate an appropriate analytical method to ensure valid and applicable outputs into the social and business practice (Korauš et al. 2019). Stepwise backward analysis was chosen and tested based on the

selection of suitable mathematical-statistical methods. It is not possible to make a final decision; however, in accordance with the obtained results, its usability for the required analyzes is proved. A part of the input (data) to the analysis tool is necessary to complete. The evaluation of the quality of regression by the determination index and the determination of the intensity of multiple dependences by means of multiple correlation coefficients are useful.

Regarding the practical outputs aimed at the region of South Bohemia, it is possible:

To point to the following conclusion related to the Progressivity Index of Economic Structure:

- The trend of increasing the number of people with university education, public transport services on weekdays, and nursery facilities are reported to be the positively influencing factors for the economic potential of the region of South Bohemia. The natives and availability of secondary schools with the Maturita exam are the negative factors. On this basis, the expected benefits and losses of additional financial deposits and investments were tested;
- Regarding the characteristics of the factors and the possibility of their use in terms of strengthening the economic potential of the region of South Bohemia, there are increased issues in the area of loss of skilled labour resources, including the university graduates, gradual but permanent loss of the native population, decrease of business activity, reduced level of service including transport, availability of secondary schools with Maturita exam is sufficient. The negative trend is related to in the departure of the students to study universities in other centres such as Prague, Brno and Plzeň. The strengthening trend of landscape fragmentation also does not contribute to strengthening the economic potential of the region.

To point to the following conclusion related to the Trend of the Progressivity Index of Economic Structure:

- Regarding the effect on the economic structure growth trend, there is a positive effect of the population density factor. The opposite, i.e. negative direction of action, is reported for the landscape fragmentation factor.
- In terms of the impact of the factors related to additional deposits, financial and other types, there is a zero response in case of the population density, although a positive effect is assumed provided the other variables are unchanged. On the other hand, the factor of landscape fragmentation has a negative financial effect, decreasing the trend index of the economic structure of the region, the most significantly of all the tested factors.
- The population density is one of the smallest in the Czech Republic and such trend continues. In the case of landscape fragmentation, a similar conclusion as in the previous index is reached; on the one hand the entrepreneurs welcome its increasing intensity, on the other hand there is an irreversible damage to the environment.

Conclusions

Many scientific workplaces both at home and abroad address the issue of stabilization and development of rural areas. The solution proves to be a limiting factor in ensuring the functionality of small and medium-sized enterprises in this area, as a decisive socio-economic accelerator and stabilizer for the rural areas. A prerequisite for a successful solution to the development of business activities is, however, knowledge of economic, and business potential. It is a fact that there is not a method available that would analyse, evaluate and present the business potential of the relevant area for its gradual fulfilment. The researchers respond to this fact and submit a new methodological procedure for scientific discussion that would respond to the real need of management and business practice. The results indicate both the appropriateness of the proposed methodical approach in terms of expertise and the suitability of the mathematical-statistical methods used, the way of presenting the results and their use in management and business practice.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

The authors are aware that this is the initial approximation of the results and some area of the methods need to be defined more precisely, and in particular, it is necessary to test the proposed model in a wider range. It is also necessary to precise the secondary data sample, to ensure their complementation and deepening by collecting the primary data with the preferential use of accessible database files. The presented results should support opening wider scientific discussion on the issue, which has long been lacking.

THE SCOPE OF LEGAL EXPECTATIONS FROM BUSINESS IN HUMAN RIGHTS: CARROT OR STICK?

Lyra Jakulevičienė [1], Dovilė Gailiūtė-Janušonė [2]

[1,2]*Mykolas Romeris Law School, Mykolas Romeris University, Ateities Str. 20, 08303 Vilnius, Lithuania*

E-mail: [1]lyra.jakuleviciene@mruni.eu; [2]dgailiute@mruni.eu

Abstract. Although not all businesses acknowledge it, most face issues of human rights in their business operations or relationships. These issues can have positive or negative impacts, whether for their employees, consumers, or communities. In times of crisis, the issues of human rights in business are even more acute − as the COVID-19 pandemic has demonstrated, already having a dramatic impact on people across many supply chains. While the perception that states are responsible for human rights broadly prevails, businesses increasingly face growing expectations to assess, address, and remedy the negative impacts of their activities. Furthermore, developments in the past decade demonstrate the evolution of such expectations into legal requirements and mandatory regulation. States have employed various tools to influence business activities in this field, ranging from soft law to legal requirements both at national and international levels. This article analyses the main European trends of such an evolution within the selected areas of due diligence, non-financial reporting, and investment, and delves into recent developments from the perspective of benefits for business. It explores if the perceived benefits for businesses exclusively serve as a 'stick' that requires compliance, or whether they might extend beyond this.

1. Introduction

Most, if not all, businesses face human rights challenges in their operations and business relationships (Baglayan, Landau, McVey, & Wodajo 2018, p. 12), but not all of them recognize these challenges. A recent survey conducted by the European Union (hereafter – EU) Fundamental Rights Agency highlighted that most human rights violations occur in the context of environmental rights, labour relations, and the field of non-discrimination (Fundamental Rights Agency 2019). Surprisingly, these are among the areas (in particular health, safety, consumer protection, labour, non-discrimination, and the environmental field) where extensive legal requirements

under national law exist for businesses (at least in the European region), and these rules are amongst the most protective and effective in the world (European Commission 2015). This contradiction demonstrates that businesses are still not eager to embark on issues of human rights, the reasons behind which might include: the additional administrative burden or perception thereof; the perception of human rights as being far from the business' main goal – profit; limited means of enforcement from the state; low awareness, etc. No less important is the notion that businesses frequently perceive the protection of human rights as being the sole responsibility of the state.

Indeed, states have traditionally been viewed as those responsible for human rights, mainly due to the fact that, firstly, international human rights treaties are signed by states. In other areas of law, such as environmental civil liability, treaties already aim to directly regulate corporations (Bernaz, 2020). Secondly, international and European bodies have, over the years, developed case-law that provides for a state's obligations to protect human rights, covering not only its own actions or inactivity but, through the concept of positive obligations, also extending to ensure that human rights are not violated by private subjects or legal entities, including companies (*Wilson, National Union of Journalists and Others v. the United Kingdom* 2002, paras. 41, 48; *Moreno Gómez v. Spain*, 2004, paras. 55, 62; *Cabal and Pasini Bertran v. Australia* 2003, para. 7.2, etc.). This includes the human rights of individuals in the value chains of businesses supplying goods and services to the state, (Maastricht Guidelines 1997, para. 18; United Nations Committee on Economic, Social and Cultural Rights 2012).

As states are not in direct control of the activities of private companies, they face the challenge of ensuring observance of human rights in the private sphere related to business. For this purpose, they have employed various tools to influence the activities of businesses in this field, ranging from soft law to legal requirements both at the national and international level. At the national level, states have adopted various legislative requirements with regard to labour standards, non-discrimination, privacy protection, and others, and promoted so-called 'responsible' businesses through various incentives. In last decade, a number of states have introduced National Action Plans on Business and Human Rights (hereafter – the NAPs), which include expectations placed on businesses to embed human rights in their policies, practices, and reporting. For instance, Lithuania adopted its first NAP in 2014 as a soft law instrument (Lithuania's Action Plan 2014), and has been elaborating on a new one in 2020 – this time likely to be approved as a normative act. Also, the development of various other soft law instruments on due diligence, supply chain management, public procurement and the like have intensified, and in certain cases evolved into, legislative initiatives binding business entities.

At the same time, some authors argue that businesses have direct obligations under existing international law, although these are limited and wholly dependent on the state's further actions of implementation and enforcement through the concept of the partial legal personality of businesses in international law (Latorre 2020, pp. 56-83). Moreover, the European Court of Human Rights tends, in some cases, to directly attribute duties to protect human rights to non-state actors (*Von Hannover v. Germany* 2004). However, up until now one cannot find any reference to the direct international human rights obligations of business entities in international law (De Brabandere 2018; Šaltinytė 2020, p. 226). Instead, businesses have a 'responsibility to respect' human rights – that is, to 'do no harm' (Morris 2020, p. 15). At the international level, soft law instruments, such as the United Nations (UN) Guiding Principles on Business and Human Rights (hereafter – UNGPs, UN Guiding Principles), have not yet turned into legal requirements for businesses, despite recent work within the UN Human Rights Council on the Draft Convention on Business and Human Rights.

Whichever concept we would follow, it is undeniable that the expectations placed on businesses to observe human rights have been increasing in recent years. In times of crisis, issues of human rights in business are even more

acute, as the COVID-19 pandemic has already had a dramatic impact on people in many supply chains (UN Working Group on Business and Human Rights 2020). Alas, what is the scope of those legal expectations, and what impact will such expectations have on business activities? Can businesses benefit from embedding human rights into their activities, or only ensure compliance with emerging legal regulations? This article investigates these questions. The aim of this article is to analyse how the most recent European legal developments related to upholding human rights in business activities shape the scope of expectations that businesses might face now and in the near future. This aim is composed of two objectives: a) to analyse the most recent European tendencies in creating legal expectations placed on businesses, alongside emerging legal requirements; b) to examine whether emerging regulation and legal expectations to embed human rights create benefits for businesses that extend beyond formal regulatory compliance.

The dialogue between business and human rights mainly concerns assessing the impacts that businesses have on human rights. This includes risks created through businesses' own activities or as a result of their business relationships, including suppliers they outsource to (UN Guiding Principles, principle 18). However, the term is also closely related to corporate social responsibility (hereafter – CSR), which is voluntary in nature. Conversely, the concept of business and human rights largely evolves from the mandatory commitments of states under international law, but also the developing legal expectations of states, stakeholders (e.g. investors), or society at large for businesses to observe standards of human rights. The concept of corporate social responsibility thematically overlaps with the notion of business and human rights, but is much broader in scope than human rights alone (Čertanec 2019, p. 109; for a detailed description of the relationship between the concepts, see European Commission 2019). The issues analysed in this article are widely explored by various authors (Ramasastry 2015; Bernaz 2017; McCorquodale, Smit, Neely, & Brooks 2017; Buhmann & Wettstein, 2017; also see the works of human rights experts such as John Gerard Ruggie, Michael K. Addo, Jena Martin, and others) who mostly focus on particular aspects of this topic, while this paper aims to place businesses in a broader context of trends, and examine whether it is beneficial for businesses to go further than simply abiding by rising requirements. It considers the trends of recent years, and examines the setbacks and benefits of processes where expectations have turned, or are beginning to turn, into legal requirements. From the methodological point of view, this article is built around an analysis of recent legislative and jurisprudential developments at the EU and national levels, and relies on doctrine, the reports of international organisations, and empirical data from various sources. The first part of the article examines the processes in selected areas where the evidence of change between expectations and legal requirements placed on business regarding human rights could be found, and the consequences of these developments where it is possible to trace a record of them. Secondly, the authors provide insights into some of the benefits of these developments by using current examples and exploring whether they add tangible value for businesses or serve only as beneficial in terms of regulatory compliance.

2. Between lawful expectations and legal requirements

At the European level, recent trends demonstrate the development of legal requirements in the area of businesses and human rights with regard, but not limited, to: due diligence, non-financial reporting, and investment. Firstly, the legal environment in Europe has changed since 2011, when 'human rights due diligence' was formally conceptualized in the UN Guiding Principles that called on companies to identify, prevent, mitigate, and account for how they address their impacts on human rights (Principle 15(b)). However, there has been little effectiveness observed in the voluntary commitments regarding human rights compliance in the supply chain. For instance, according to a recent study in the German government report of July 2020, companies do not voluntarily do enough for human rights. It also states that not even a fifth of the companies surveyed voluntarily abide by human rights standards (Aryobsei & Scherb 2020).

At the EU level, the requirement of due diligence has been developing in the direction of emerging legal regulation. Having started from a sectorial approach in 2010 and 2017 by including the requirement for due diligence as mandatory one (Regulation (EU) 995/2010, Regulation (EU) 2017/821), the EU has a strong commitment to expand it to other sectors. The European Council Conclusions on the EU priorities in the UN human rights forums adopted on 17 February 2020 highlight the focus on due diligence initiatives, among other priorities. As will be demonstrated later, the trend for mandatory due diligence follows also from the financial sector and the expectations of investors. On 29 April 2020, the European Commission confirmed its commitment to introduce mandatory assessment of the impacts of business activities and supply chains on the environment and human rights (European Commission 2020). The Commission will prepare draft legislation by 2021. These developments are in parallel to national ones, where some legislators establish a legally binding obligation for parent companies to identify and prevent adverse human rights and environmental impacts resulting from their own activities or those of companies that they control, and from the activities of their subcontractors and suppliers with whom they have an established commercial relationship. France was the first country to adopt the due diligence requirement in its Duty of Vigilance Law in 2017, followed by the Netherlands with the Child Labour Due Diligence Law in 2019, and various other governments are now considering legislative proposals (e.g. Austria, Luxembourg) (Business & Human Rights Resource Centre, n.d.). In Switzerland, the Responsible Business initiative has been launched and its counterproposal, the parliamentary initiative for mandatory human rights due diligence, was approved on 5 June 2020 (Business & Human Rights Resource Centre 2020b). However, as the members of the Responsible Business Initiative rejected this counter-proposal, there will be a public referendum in late 2020 on this issue (European Coalition for Corporate Justice 2020). Germany will soon be introducing the Supply Chain Act, obliging companies to comply with human rights and environmental standards by law (Schenk, Thorhauer, et al. 2020).

At the same time, research demonstrates that the commonly used tools of due diligence are not very effective at improving respect for human rights (see the research of Locke 2013; Barrientos & Smith 2007; Lindholm, Egels-Zandén, & Rudén 2016; Curley 2020; Alliance for Corporate Transparency 2019, pp. 98–99). Among the reasons for this are: the notion that due diligence is misunderstood by many companies as a mere reporting obligation (Gregor & Houston 2020); and the idea that many companies do not have the necessary expertise to implement effective human rights due diligence, whilst the right expertise can also be difficult to find externally (UN Working Group on Business and Human Rights 2018). Another reason that has been identified is the growing complexity of corporate structures, which complicates the implementation of due diligence tools not only in the parent/controlling company, but within its business relationships as well (CIDSE 2013, p. 3). Moreover, states are not always willing or able to meet their duty to protect (CIDSE 2018, p. 5). Therefore, the development of new legal requirements at the EU level should consider and address these drawbacks of the new legislation, in particular by improving: understanding of the value of the requirements; the relationship between materiality and reporting (i.e. what exactly the companies do); and enforcement.

Another trend of rising expectations from businesses is related to non-financial reporting, where mandatory requirements have existed since 2014 and are further developing. EU Directive 2014/95/EU of the European Parliament and of the Council of 22 October 2014 – amending Directive 2013/34/EU, as regards the disclosure of non-financial and diversity information by certain large undertakings and groups (also called the EU Non-Financial Reporting Directive) – embodied the duty of large companies from 2018 onwards to annually publish information on non-financial issues, including on the risk of negative impacts on human rights which are directly related to the activities, products, services, and business relations of the company. However, one recent study demonstrated that, of the 1,000 companies assessed, almost 57% report on risks related to human rights, but only

around 4% report on concrete measures in this regard (Alliance for Corporate Transparency 2019, p. 70). According to the authors, general human rights reporting requirements are not an effective tool for ensuring the disclosure of information that can help to assess a company's management of the individual risks of human rights impacts, and by extension of whether its business conduct is responsible (Alliance for Corporate Transparency 2019, p. 70). The European Commission announced in its Communication on the European Green Deal in 2019 that companies and financial institutions should improve their disclosure of non-financial information, and it plans to revise the Non-Financial Reporting Directive in 2020 as part of a strategy to strengthen the foundations for sustainable investment. This demonstrates that, despite the existing legal requirements, the users of this information (mainly investors and civil society organisations) are demanding more and better information from companies about their social and environmental performance and impacts. This also reflects global trends, with a wide variety of different organisations and stakeholders calling for consideration of a new regulatory approach to non-financial reporting (European Commission 2020).

The third area of development for human rights expectations placed on businesses is in the financial sector. There have been developments both in terms of expectations from investors and the requirements that have been rising for clients in the financial sector. Since the primary obligation to observe and ensure respect for human rights lies with the host state, foreign investors cannot be said to be the direct holders of human rights obligations under international law. The obligations foreign investors have are essentially based on domestic civil or criminal law (De Brabandere 2018, p. 5). This is in line with the primary objectives of traditional investment treaties: to grant rights to foreign investors rather than impose obligations on them (Dubin 2018). Investment tribunals, so far, have also contested the notion that dealing with human rights issues in investment disputes falls within their jurisdiction (De Brabandere 2018, p. 9). For example, when Argentina filed a counterclaim regarding the investor's breach of the human right to water in the *Urbaser v. Argentina* case, the tribunal concluded that Argentina's claim could not be accepted, as the human right to water created obligations for states only (*Urbaser and Consorcio de Aguas Bilbao v. Argentina* 2016, para. 1210). At the same time, the arbitrators considered that 'the situation would be different in case an obligation to abstain, like a prohibition to commit acts violating human rights[,] would be at stake. Such an obligation can be of immediate application, not only upon States, but equally to individuals and other private parties' (para. 1210). Despite the traditional objectives of investment treaties, there have been some examples where indirect clauses were provided in investment treaties through CSR as a self-regulating technique (Canada–EU Comprehensive Economic Trade Agreement; Dubin 2018). The UN Conference on Trade and Development (UNCTAD) World Investment Report 2018 notes that most of today's new international investment agreements include sustainable-development-oriented reform elements, and finds remarkable differences in these agreements between 2000 and 2017 in that the newer ones explicitly recognize health, safety, and environment standards (UNCTAD, 2018). In its 2020 report, the UNCTAD confirms that recent treaties increasingly incorporate aspects of sustainability (UNCTAD 2020, p. 19). Although human rights obligations for foreign investors are explicitly included in investment treaties only rarely, because the primary objective of traditional investment treaties is to grant rights to foreign investors rather than impose obligations on them, there are several recent examples of investment treaties containing clauses which refer to the obligations of foreign investors in the area of human rights (De Brabandere 2018, p. 10). For instance, the Intra–MERCOSUR Agreement contains 'a "best efforts" obligation for investors to respect the human rights of the people involved in investment activities, and to promote the building of local capacity and the development of human capital' (Baglayan et al. 2018, p. 29). Other examples include the 1990 EC–Argentina cooperation agreement, the 2008 EU–Cariforum agreement, and the Cotonou Agreement (Bartels 2014). However, direct clauses in investment treaties often use weak language or are relatively weak in substance (Dubin 2018). For instance, Article 24 of the Pan-African Investment Code uses conditional verbs ('should') to encourage investors to comply with internationally recognized human rights laws (African Union Commission 2016). At the same time, one can

conclude that the emerging provisions in investment treaties reflect a new approach that might develop in the future. Furthermore, investment treaties may deny protection to foreign investors of the other party that have engaged in conduct leading to a violation of human rights (UN Committee on Economic, Social and Cultural Rights 2017, para. 50).

Besides the developing requirements for investors on human rights, they themselves increasingly direct their investments into activities that are not harmful and that require companies to prevent, mitigate, or remedy impacts where they occur (Alliance for Corporate Transparency 2019, p. 71). Thus, while more investors are considering sustainability and long-term options, investor scrutiny is increasing in capital allocation decisions (Baglayan et al. 2018, p. 10). In September 2019, the Principles of Responsible Banking were adopted at the global level by one third of banks worldwide, which, among banks' internal commitments to evaluate and manage their impacts on people and environment, also call for banks to encourage sustainable practices among their clients and customers (UN Environment Programme Finance Initiative 2019, Principle 3). Moreover, in April 2020, over 100 investors called for the responsibility of economic actors to respect human rights, and that human rights due diligence is a key requirement for companies to meet this responsibility. They expressed expectations that governments adopt binding human rights due diligence requirements where corporate voluntary action leaves gaps in human rights protection (Business & Human Rights Resource Centre 2020a). Meanwhile, the EU is progressively considering requirements for the financial system that support the EU's climate and sustainable development agenda. In 2018, the European Commission adopted the Action Plan: Financing Sustainable Growth, which provided a roadmap by setting out the role of finance in achieving a well-performing economy that delivers on environmental and social goals. It also called for the development of a taxonomy of sustainable activities, which the banking sector should foster and deploy as the basis for a future EU taxonomy in legislation (UN Environment Programme Finance Initiative 2019, p. 4).

In conclusion, the evolution of expectations towards legal regulation for businesses in the areas of human rights analysed range from soft law, to partial regulation (mainly reflected by the sectorial or business-type approach), to full regulation (mandatory provisions for all). As can be seen from the Figure 1, full regulation is still not achieved in the areas analysed. While human rights due diligence is most advanced in terms of legal regulation, so far mandatory requirements have not attained a wide recognition at the national (few examples only) or the EU levels. At the same time, considering the EU political commitments, the prospective regulation in this area is most realistic (EU level).

3. The benefits of integrating human rights into businesses policies and practice

The benefits for businesses stemming from the integration of human rights practices have been extensively documented and analysed (Parella 2019; Bonfanti 2019 and others), and were consolidated in the 'Good Business: The Economic Case for Protecting Human Rights' report in 2018 (hereinafter – the Good Business Report; Baglayan et al.). This report was a first step towards building more evidence-based research on the so-called 'business case' for corporate human rights responsibility, and it summarised the key economic drivers for businesses in human rights in the four areas illustrated in Figure 2.

Figure 2. Key economic drivers for businesses in respecting human rights.
Source: Baglayan et al., 2018, p. 17

Since this report, there have been a number of developments that highlight the evidence of benefits for businesses – those of an economic nature in particular. The report highlighted two dimensions of benefits: a) the reduction of cost and risk (worker loyalty and productivity and reducing risks of litigation and to reputation); b) competitive advantage (procurement and investment).

The issue of business and human rights is sometimes perceived as an issue relevant for multinational companies only. For instance, some companies claim that they operate in the EU, where labour regulations are overemphasized and there is no issue of human rights in this sphere in the region (based on the authors' own encounters with business associations and companies in Lithuania). This is not true, as each company, large or small, is routinely faced with human rights issues. First of all, companies increasingly invest in foreign states where human rights and corruption concerns exist; thus, it might be useful to have due diligence procedures in order to assess the risks involved. These measures allow businesses to assess and manage potential risks in a timely manner, and to ensure the preservation of their reputation in risk markets. The formalizing of a common piece of human rights due diligence legislation at the European level, as we have seen in part I of this paper, could come with an additional benefit. It would level the playing field – or at least ensure that all businesses incur the same costs with regards to reinforcing their management systems and practices. This, in turn would create legal certainty. The resulting unity is expected to help corporations gain the necessary traction and leverage to address

systemic issues across their supply chains (Dillon 2020). Secondly, due diligence could help to avoid or minimize legal suits. A review of 151 litigation cases showed: a rapidly increasing trend in the frequency of these lawsuits; steadily rising direct financial costs; and that companies are increasingly opting for out-of-court settlements, despite the substantial expense associated (Baglayan et al. 2018, p. 10). Recently, a few important judgments on human rights issues in business have been issued by the courts in Europe. The judgment of the United Kingdom (UK) Supreme Court of 10 April 2019 in *Vedanta Resources PLC v. Lungowe* confirmed that a parent company can be liable for the operations of its subsidiary in the English courts, despite the fact that harm to the local population by polluting water occurred in Zambia. Thus, there is the possibility for non-UK claimants to bring claims against them in English courts (*Vedanta Resources Plc and Konkola Copper Mines Plc v. Lungowe and Others,* 2019, paras. 53–54). On 1 May 2019, the Dutch court ruled in *Kiobel v. Shell* that it has the jurisdiction to determine whether Royal Dutch Shell was complicit in the 1995 Nigerian government's execution of the applicants' husbands—part of the Ogoni 9 activists—who contested Shell's operations and the Nigerian government over the effects of oil pollution (para. 4.23). Differently from previous lawsuits in the United States on the same subject based on tort law, this lawsuit aims at engaging the Shell concern directly in a lawsuit on the infringement of the human rights included in the African Charter on Human and Peoples Rights (ACHPR) and the Nigerian constitution. The trend is that companies now face an increasing risk of legal action and the economic costs it entails, because corporate human rights litigation is costly in terms of finance, reputation, and time (Baglayan et al. 2018, p. 41). In 2018, the Good Business Report identified five types of costs related to human rights lawsuits: financial cost; out-of-court settlement; information-disclosure cost; reputational damage; and potential stock-price decline. As to reputational damage, bad publicity subsequent to a lawsuit often damages the public image of the firm regardless of the final ruling (Baglayan et al. 2018, p. 53).

Companies that export goods and services need to be aware that there are developments in the field of export credits, which add further economic incentives or disincentives for respecting or not respecting human rights. States may refuse access to export credits and other forms of state support in case of human rights issues, thus compliance with requirements may ensure advantage for responsible companies (UN Committee on Economic, Social and Cultural Rights, 2017, para. 15). Although little research has been conducted on the effects of these opportunities, the risks of non-compliance are evident (Baglayan et al. 2018, p. 10).

Those companies that do not invest and not operate in risk countries might be procuring raw materials, products, or services in its global supply chain, thus human rights prevention measures assist in evaluating and managing risks in that chain and in ensuring the reputation of the company. Such risks may include legal (incurring liability for human rights abuses), financial (costs associated with delays in contract delivery, re-running procurement exercises, or remediating harm to victims), or reputational risks. However, if addressed effectively, such risks may become opportunities (Morris 2020, p. 10).

Apart from avoiding the negative consequences of not observing human rights, a company's pro-active role in embedding human rights in its business can lead to additional advantages, including through the economic incentives that public agencies can employ. This is particularly true for companies that aim to attract investment, participate in stock exchanges, and obtain funding from national and international funds, as they are viewed more favourably when they have human rights policies and implement concrete measures thereon (Baglayan et al. 2018 pp. 29–40). Investors assess such companies more positively when they implement human rights measures in business activities, as confirmed by the Responsible Banking Principles, signed by banks in September 2019, which demonstrates their commitment to sustainable business − also including human rights (UN Environment Programme Finance Initiative 2019). Inversely, being seen to create problems for communities or the environment can repel investors. Among recent examples of this effect is the Grigeo company in Lithuania, the

share price of which dropped by almost 30 percent following environmental damage caused to the local population as a result of allegedly negligent behaviour with water waste management at the beginning of 2020 (Blekaitis 2020). Furthermore, states also aim to promote responsible companies. For instance, the Swedish government publishes examples of responsible companies, as investors more favourably regard the investment climate in such countries (Sustainable Business in Sweden, n.d.).

As the utilisation of human rights standards in public procurement contracts has become common in countries implementing the UNGPs (Baglayan et al. 2018, p. 10), companies may also possess advantages in national and international tenders, where those capable of demonstrating performance as per high social standards are more favourably considered. This may provide a competitive advantage, in particular within social and sustainable public procurement processes. Increasingly, governments are using economic leverage as a tool to enhance compliance with human rights, as well as environmental and labour standards, by conditioning conveyance of economic benefits upon corporations' performance in these areas (p. 29). EU procurement laws contain an overarching 'social clause' that requires EU Member States to take appropriate measures to ensure, in the performance of a contract, that economic operators comply with the applicable environmental, social, and labour law obligations, including ILO Conventions (Article 18 of the Directive 2014/24/EU). More specifically, they cover: the requirement to exclude bidders that have been convicted of child labour or other forms of trafficking in human beings (Article 57(1)); the possibility to exclude bidders due to non-compliance with environmental, social, or labour law obligations (Article 57(4)); and, for the first time, social considerations in the awarding phase. Article 69 requires contracting authorities to reject tenders that are abnormally low due to poor human rights standards, in case the supplier is unable to satisfactorily account for the low level of the price (Morris 2020, p. 30). These developments are supported at the national level, where more and more states are now adopting national action plans on sustainable public procurement where the social element is informed by human rights (Morris 2020, p. 34−35). For example, Belgium's Public Procurement Act of 2017 requires that suppliers and sub-contractors comply with environmental, social, and labour laws, and failure to comply with this requirement may serve as a ground for exclusion. Switzerland's updated National Action Plan 2020–2023 on business and human rights refers to the Federal Act on Public Procurement, which envisages that the contracting authority may require bidders to comply with other core international labour standards, provide proof of compliance, and agree to audits (Morris 2020, p. 31). Companies that have already embedded these practices would find themselves at a competitive advantage in terms of meeting such requirements. Incentives are also developing at the municipal level. In 2020, the City of Malmö in Sweden introduced a scheme to analyse and prioritise procurement exercises with the greatest environmental and social impact. For example, a procurement exercise related to transport will achieve a higher rating on the list of prioritised procurement exercises if it contributes to realising this goal. This scheme takes into consideration a procurement's economic value as well as its scope for positive impact. Where leverage to influence the market is higher, projects are also ranked higher on the list of prioritised procurement exercises (Morris 2020, p. 70). On the other hand, if the state does not recognize business efforts in public procurement exercises, it may discourage businesses from sustaining such practices (Morris 2020, p. 10).

If directly related to core business activities, the integration of human rights principles into business policy, practice, and communication, could contribute to opening new business opportunities (e.g. expanding the range of clients by including vulnerable populations if the products and services are made more accessible). Also, a company that respects human rights internally and externally can profit from a more loyal, engaged, and productive workforce, as well as avoid supply chain disruption and employee-based litigation claims (Baglayan et al. 2018, p. 21). This particularly supports business resilience in case of crisis. For instance, those companies that earlier provided opportunities for a better work−life balance to their employees by allowing for the possibility of remote working were able to adapt much more easily and quickly to the changing labour conditions brought about

by the arrival of the COVID-19 pandemic, and the resulting quarantine. Surveys provide evidence that job loyalty rises as businesses address employee needs, from diversity and inclusion to sustainability and reskilling (Deloitte 2020). Apart from internal human rights issues, research confirms that inclusion and engagement with affected communities is not only a matter of mitigating risk, but can also be financially rewarding (Baglayan et al. 2018, p. 27).

4. Conclusions

Although researchers and international organisations acknowledge that voluntary commitments by businesses in the field of human rights do not yield effective results, the emerging binding requirements have also demonstrated drawbacks in achieving their aims. So far the existing legal requirements have had a limited effect on human rights compliance, and have served more as a 'stick' rather than a perceived 'carrot' that brings benefits for businesses.

However, the legal regulation on business and human rights needs to be viewed as something that creates opportunities—not only constraints—for businesses. The full use of such benefits can only be possible if states demonstrate strong leverage commitments to human rights requirements placed on business, for example in public procurement and other incentives, and create a positive environment for business action.

While human rights due diligence is most advanced in terms of legal regulation, so far mandatory requirements have not attained wide recognition at the national (few examples only) or the EU levels. At the same time, considering the political commitments of the EU, the prospective regulation in this area is most realistic. Its value would be enhanced both for businesses and for human rights compliance if noted drawbacks are addressed when creating the EU-wide mandatory rules on due diligence. This could include: promoting understanding of the content and the value of the requirements of due diligence, as well as the relationship between materiality and reporting, creating enforcement mechanism and possibly differentiating the requirements for small and large businesses as their capacities differ.

Expectations from companies that are turning into legal requirements − in particular on due diligence, access to capital, and non-financial reporting − are not a threat to business and are reasonable. Expecially, if we consider that ignorance of existing impact on human rights might result in financial, reputational, investor relations, or other risks and costs, such as litigation. Understanding these expectations allows companies to easier navigate the changing business environment, which would otherwise be quite alien to businesses accustomed to the previous landscape.

Abstract. The objective of this research is to understand the effectiveness of National Development Agency (NDA) training; the study investigates the effects of training design characteristics (training content) and learning on training effectiveness. The study looked into the effect of training design factor consisting of training content and acquisition of skills and knowledge of trainees on training effectiveness in training program attended by Board members of NPOs in Gauteng Province. About 200 respondents from different NPOs in the Gauteng province of South Africa who attended the NPO Compliance and Governance training participated in the study through an online survey. Training content and learning of trainees have a significant effect on training effectiveness. Furthermore, the respondents indicated that their NPOs did not improve on their poor governance and non-compliance to the NPO Act as a result of the NDA training.

1. Introduction

Non-profit organizations (NPOs) play a significant role in the social and public spheres of South Africa. The Non-Profit Sector, by its virtue, does not exist to generate revenues but instead exists to meet the social needs of the marginalized while operating outside the ambit of Government. The National Development Agency and the National Lottery Distribution Trust Fund requires NPOs to be registered in terms of the NPO Act as a condition for funding. Furthermore, it is believed that registration contributes to increased NPO transparency and credibility (Sangonet, 2013). The Government and donors require NPOs to be legally registered to grant fund them; however, this is a challenge as most NPOs are de-registered due to non-compliance to the NPO Act. One common challenge faced by the Non-Profit sector is weak or non-existent governance structures, lack of accountability and transparency (Ebrahim, 2010). Furthermore, Limited knowledge on roles and responsibilities of the NPOs Board members, lack of accountability, and non-disclosure of finances are fundamental governance issues that weaken the effectiveness of the Non-profit sector. Good governance remains the heart of the effectiveness and

sustainability of the non-profit sector. There are supportive government initiatives in respect of NPOs which aims at making them accountable and transparent by enhancing the skills of the Board members. Despite training-supportive initiatives by both Government and the Private sector, the fact remains that the performance of NPOs concerning Governance and compliance to the NPO Act is not as expected.

The Department of Social Development (DSD) has a legislative role in monitoring the registered NPOs in South Africa. The monitoring process involves the annual submission of narrative and financial reports by the registered NPOs, and failure to do so leads to cancellation or de-registration. The NDA is a public entity, listed under Schedule 3A of the Public Finance Management Act (PFMA), Act 1 of 1999. The NDA reports to the Parliament of the Republic of South Africa through the Minister of Social Development. Moreover, the agency is mandated to contribute to the eradication of poverty and its causes. The NDA must contribute towards building the capacities of Civil Society Organisations to enable them to carry out development work effectively (National Development Agency Act No 108, 1998). In the financial year 2016/17, the NDA trained just more than three thousand Civil Society Organizations (CSOs) in all the nine provinces of South Africa on governance and NPO Act compliance. Resultantly, the impact of the NDA interventions has improved the compliance of those CSOs with the NPO Act (NDA, 2017, p. 8). The increasing numbers of the de-registered NPOs reported annually by DSD due to non-compliance to the NPO Act is an indication of the need for rigorous training to improve the status quo of the sector. Owing to the NDA investments towards the training, it is fundamental to understand if the training was worthwhile and relevant. All this boils down to evaluating the training effectiveness; as such, this research investigated the effects of training content on the trainee's learning and change in behaviour.

According to Homklin et al. (2014), further research is necessary to explore other multidimensional influencing training effectiveness. These factors include training design, as most research studies analysed the effects of individual and work environment factors on training effectiveness. Training content refers to "the result of deciding on what to include in the training program for learning to take place" (George & Singh, 2000, p. 149). Deciding on the training content is fundamental in ensuring that the training content matches the training needs and objectives of the trainees. The training content usually refers to what is taught, at which level and in what amounts (Alias, Ong, Rahim, & Hassan, 2019). The Kirkpatrick four-level evaluation model (1994) has served as the primary organizing framework for training evaluations for over 40 years (Bates & Coyne, 2005). The model delineates four levels of training outcomes: reaction, learning, behaviour, and results. Kirkpatrick's model assesses the effectiveness of training programs at four levels: Level 1-Reaction, the attitude of the trainees; Level 2- learning, the learner's learning outcomes and increases in knowledge, skill, and attitude towards the training (how much attendees learned the content after training); Level 3 –behaviour, the students' change in behaviour and improvement (whether the learning transferred into practice in the workplace); and Level 4-Results, the ultimate impact of training at the organizational level. In particular, the distinction between learning (level two) and behaviour (level three) has drawn increased attention to the importance of the learning transfer process in making training truly effective (Bates & Coyne, 2005). Therefore, in trying to understand the effectiveness of NDA training, the study investigates the effects of training design characteristics (e.g. training content) and learning (acquired skills and knowledge) on behaviour (training transfer) of Board members in Gauteng. In the NDA, evaluation of training is usually done immediately after the training by using feedback forms.

The NDA training approach is more theoretical and is delivered through PowerPoint presentations with no tests given to the trainees to test their knowledge because of the training. According to Kirkpatrick's model, NDA can be considered to be only measuring its training at the "Reaction" level, the other levels such as learning and behaviour are not known. "Organizations that are considering reaction as the only parameter to gauge the effectiveness of training can be highly misled by results as reactions of trainees after the end of training do not reflect the true and complete picture of actual training effectiveness" (Rehmat, et al., 2015). Furthermore, the training duration is about one to three days. This evaluation approach has limitations, as it does not look into what has been learned and transferred back in the job months after the NDA intervention. Consequently, the

effectiveness of such intervention cannot be confirmed in the context of the acquisition of new skills, attitudes and knowledge, and their transferability back in the organizations thereof. The study attempts to fill in, at least partly, the present gap in understanding the factors affecting the transfer of training in NPOs and provide some inputs for designing training interventions effectively to ensure greater transfer. The findings of this study would help the NDA to deliver its future training interventions that support the NPOs in improving their current status of poor governance and non-compliance to the NPO Act.

2. Literature Review

Training and development are indispensable strategic tools for competent individual and organization performance; thus, organizations are spending money on it with confidence that it will earn them a competitive advantage in the world of business (Falola, Osibanjo, & Ojo, 2014). The previous literature has identified three main determinants of training transfer, namely work environment (Na-nan, et al., 2017), trainee characteristics (Singh, 2017) and training design (Phillips & Bullock, 2018). Many organizations invest lots of their financial annually on training initiatives; however, few organizations possess training programs that effectively transfer received training back on the job to improve performance (Foxon, 1993). Furthermore, learning satisfaction achieved through the cognitive apprenticeship teaching approach during the training course was found to be superior to that achieved through the conventional teaching approach of lecturing, as a result, the acquired skills and knowledge from the training were transferred back in the workplace (Tsui & Chen, 2020). The perceived importance of training content influences training transfer (Bhatti, Battour, Sundram, & Othman, 2013). The extensive reviewed literature on training transfer identified several factors such as the learning environment, cultural differences and work environment. Furthermore, training content design amongst other factors was found to have an impact on training effectiveness (Mohanty, Dash, & Das, 2019). The training content should be understandable and applicable to the trainees, and the materials should be consistent with the proposed course, learning objectives, and outcomes (Falola, Osibanjo, & Ojo, 2014). A study by El-Hajjar and Alkhanaizi (2018) found a positive linear correlation between training content relatedness and training effectiveness. In other words, training content that relates to everyday duties will positively affect the transfer of skills and knowledge in the job. The perceived usefulness of the training content affects the reaction, learning, and behaviour of trainees (Nikandrou, Brinia, & Bereri, 2009).

Furthermore, Bjerregaard et al. (2016) found training content relatedness to the actual day-to-day work activities to have a significant influence on the trainee' reaction, learning and an increase in the motivation to transfer learning. The findings coincide with those by Grossman and Salas (2011) who found a positive relationship of content relatedness to the trainees' attitude, learning, and transfer of learning. The leaners' perception that "training content is similar to the actual job tasks" also leads to a positive affective reaction, learning and transfer motivation (Bhatti & Singh, 2010). There was an improvement in test scores of the students after the team-based learning sessions when compared to the test scores after lecture sessions. The study found a higher amount of knowledge retention on team-based exercises as compared to just lecture sessions, consequently, training was effectiveness as the knowledge and skills were transferred back in the job by a majority of the respondents (Rezaee, et al., 2016).

Moreover, the overall results of the study by (Heydari, et al., 2019) suggested an increase in learning and satisfaction can lead to changes in behaviour scores. This means that learning of new skills and knowledge that are relevant and useful can lead to the transfer of training. There were also significant direct effects between perceived content validity and perceived application to practice (Grohmann, Beller, & Kauffeld, 2014). This finding suggests that knowledge that is explicit in terms of similarity between the training content and the job requirements is crucial as it boosts trainees' confidence in applying what they have learned back in the work environment. Gegenfurtner et al. (2009) suggest that setting clear training objectives may contribute towards the improved transfer of learning. Prior research showed a positive relationship between the training objective and

transfer of knowledge (Diamantidis & Chatzoglou, 2012). The absence of training objectives and goals have adverse effects on the training evaluation process (Goldstein & Ford, 2002).

Furthermore, training objectives were found to have a significant effect on trainees' reaction, learning and behavioural change (Diamantidis & Chatzoglou, 2012). Other studies found a significant relationship between training objectives and results (Lin et al., 2011; Homklin et al., 2014). Research has proven the unlikelihood of training efforts to result in positive changes in job performance if no newly competencies have been transferred back in the work environment (Montesino, 2002). As a result, there has been an increased effort in understanding the antecedents and consequences of transferring learning back in the workplace (Velada, Michel, & Caetano, 2007). Concerning acquisition of new skills and knowledge as the influencers of training transfer, the learning moderated the relationship between the application of training and the transfer of training (Alfonso, Jorge, & Mara, 2018). Also, the learning culture moderates the relationship between the application of training and the transfer of training. However, measures of learning outcomes lack sophistication and the relationships between many of the key learning and teaching factors have not been clarified. As a result, continuing to understand the influence of learning on the transfer of training, learning factors and teaching approaches should not be studied in isolations (Deng, et al., 2019).

Research Hypotheses

This study aims to understand the influence of training content and trainee's learning on training effectiveness. The following hypotheses were formulated (Figure 1):

H1: Training content positively affect training effectiveness

**H2:** Learning (skills, attitude and knowledge) positively affect training effectiveness

Figure 1. Hypothesized Framework

3. Research Design and Methodology

3.1 Population and Sample Selection

The population size was 589. Since the researcher is evaluating the effectiveness of governance training, the sample included elements that constitute the individuals who are members of the governing body/Board members of the NPOs. The unit of analysis is Board members of NPOs in Gauteng province that attended the NDA training in the year 2015. A sampling frame is a list or other device used to define a researcher's population of interest. The sampling frame defines a set of elements from which a researcher can select a sample of the target population (Lewis-Beck, Bryman, & Liao, 2004). Once a sampling frame is in place, a decision on the sampling size commences, and then followed by the method of sampling, which can be either probability or non-probability (Sekaran & Bougie, 2014). In probability sampling, all elements of the population have an equal and known (non-zero) probability of being included in the sample (Alvi, 2016). The NDA training database was used as a sampling frame to select the study participants.

3.2 Data Collection

The study employed a survey strategy to collect primary data to achieve descriptive statistics. A simple random probability was used as a sampling technique. The determination of the sample size for the study was 95% level of confidence, with a margin of error of five; this means that the sample size of the study was 253 respondents. The questionnaire comprised of 19 items (6-demographic information, 13 statements). A five-point Likert scale was used to measure the variables with values ranking from lowest to highest where 1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree, and 5 = strongly agree. Through the review of the literature, the process resulted in four indicators of learning, four indicators of training content and five indicators of training effectiveness. All the study participants received a link through their email to participate in the online survey. The survey questions were drawn from the study by Al-Mughairi (The evaluation of training and development of employees: The case of a national oil and gas industry, 2018). In ensuring the measurement validity, a pilot study was conducted by the researcher amongst the 18 Board members who received the same training. The pilot participants were not included in the sample of the actual study. The primary data were collected between the 07th January 2019 and 26th July 2019. In ensuring that the rate of responses is satisfactory, the survey was designed to send reminders bi-monthly, and no further responses were allowed after the cut-off date of the 26th July 2019.

4. Results and Discussion

The basic purpose of the study was to understand the effectiveness of NDA training by investigating the effects of training design characteristics (training content and objectives) on learning and behaviour of the Board members of the NPOs that attended the NDA training. The results show that there is a little improvement of the skills and knowledge of Board members that attended the NDA training as well as the transfer of training back in their organizations, which supports the basic argument of this study that the perceived effectiveness and return on investment on this training by the NDA is unknown.

4.1. Data Management and Screening

The data collection process was undertaken from January 2019 to July 2019. The questionnaire was distributed to 253 respondents through an online survey via simple random sampling technique. The SPSS for Windows (version 24) software was used to clean the data and screen the data by identifying any outliers, missing data and descriptive statistics. After the identification of anomalies in the data, a set of procedures were applied for handling outliers to ensure that the data analysis is accurate. Kurtosis and skewness were used to assess the normality distribution of the data. Missing data is the unavailable values for one or more variables (Hair, Sarstedt,

Hopkins, & Kuppelwieser, 2014). The missing of data is common in survey studies (Bryman & Cramer, 2011). Furthermore, missing data can influence the ability of statistical tests to establish relationships in a data set, and as a result, it causes parameter estimates that are biased (Hair, Sarstedt, Hopkins, & Kuppelwieser, 2014). Univariate detection method through SPSS was used to identify outliers. The detection of univariate outliers assisted the researcher in identifying cases with minimum and maximum values per variable. The data were first converted to standardized scores (z-scores). According to Tabachnick and Fidell (Using Multivariate Statistics, 2013), the cut-off value for potential outliers is ± 3.29; any value exceeding this number is considered a potential outlier. This study adopted a cut-off value of ± 3.29 for the standardized scores as potential outliers. There were nine cases detected with outliers, after removing the nine cases (*Case 3, 5, 8, 102, 18, 23, 104, 178 and 194*) that had the same answers throughout the questionnaire. These were cases with z-score of more than ± 3.29. As indicated earlier in this section, the nine cases/respondents selected the same responses on a Likert-scale for all the statements in the questionnaire. The number of returned/completed questionnaires was 209 after the removal of cases with outliers, and there were no missing values. These responses could not be disregarded as they could affect the reliability of the results. The cases were removed from the dataset, leaving the number of responses to 200 from the initial 209, which then translated to a sample size of 79% appropriate for further data analysis.

4.2 Descriptive Analysis

The researcher applied the descriptive analysis (frequencies and means) to understand the preliminary data and to summarise the demographic information of the respondents to get a feel of the preliminary data (Sekaran, 2003). Furthermore, Cronbach's Alpha test computed to measure the internal consistency of the instrument. The minimum performed acceptance for Cronbach's alpha was 0.7 for the reliability coefficients (Hinton, Brownlow, Mcmurray, & Cozens, 2004). The distribution of respondents by gender; age; education, NPO location, experience and occupation are depicted in Figure 2.

Figure 2. Demographics of the Study Respondents

The results indicate that the majority of the respondents were females (70.5%, n=141), while 29.5% (n= 59) comprised of male respondents, this is a common feature in the NPO sector, especially within the South African context whereby majority are women. Grouping according to age shows (51%) of the respondents were between 40 and 49 years of age. The second-highest percentage of respondents was 20.5% (n=41) who were between 50 and 59 years old, 19.5% (n=39) were between 20 and 39 years old, 5% (n=10) were 60 years or older, and finally, about 4.3% (n=8) were below 20 years of age. The most significant percentage of respondents were based in City of Tshwane with 31.5% (n=63), while the second-largest number of respondents selected Ekurhuleni with 30% (n=60), followed by Sedibeng with 20% (n=40). A slightly small number of respondents indicated that their organizations are in City of Johannesburg 18.5% (n=37). The highest percentage of respondents had between 6-9 years of NPO work experience with 44% (n=88), followed by 2-5 years of work experience with 28% (n=56), then ten years or more with 27% (n=54) while only 1.1% (n=2) of the respondents had one year or less of NPO work experience. The highest percentages of the survey respondents were Board secretaries within their respective NPOs at 41% (n=82), while 35% (n=70) were Board treasurers and 24% (n=48) were Chairpersons of the NPO Board.

Table 1. Reliability Results of the Study Construct

Constructs	Items	Items Deleted	Cronbach's alpha
Learning	4	0	.763
Training Content	4	0	.751
Training Effectiveness	5	0	.821
Total Items	13	0	

The internal consistency of the reliability of the instrument showed a good internal consistency for all the three study constructs. All the elements within each construct conformed to the minimum criteria of Cronbach's Alpha ($\alpha \geq .70$). The Cronbach's alpha value for training content (0.751) was acceptable, though lower than those of learning (0.763) and training effectiveness (0.821). As maintained by Hinton et al. (SPSS Explained, 2004), the internal consistency of 0.7 is acceptable, and the instrument can be deemed reliable to measure what it is intended to if it meets this minimum score. No items were deleted to increase the Cronbach's score as they all exceeded a minimum acceptable of Cronbach's Alpha score.

The learning construct statements outlined in Table 2 indicate a level of disagreement for "I learned a lot on NPO Governance and compliance to the NPO Act from this training" (M=2.92). Respondents expressed a high agreement for "I have forgotten most of what I learned from this training programme." (M=4.16). Moreover, neutral responses for "My newly acquired skills and knowledge qualify me for dealing with poor governance issues." (M=3.43), and "My newly acquired skills and knowledge qualify me for dealing with NPO Act compliance issues" (M=3.08). The training content construct statements indicate a high level of neutral responses for "The information provided in this training programme was easy to apply" (M=3.10), "Information offered in this training improved my professional competencies" (M=3.07) and "The importance of applying training skills in the workplace was identified". Respondents expressed a level of strong disagreement for "The knowledge and skills required for my job were well supported by the practical activities and exercises of this training programme" (N=1.73). The final construct of training effectiveness indicates a neutral response for "I have applied what I learned in the workplace" (M=3.06) and "I am committed to utilizing the skills and knowledge from the training" (M=3.03). The items with lower Means scores were associated with "I have transferred what I learned to my colleagues in the NPO" (N=2.99), "My NPO has improved its non-compliance and poor

governance because of this training" (N=2.99) and "The training has helped in performing my roles and responsibilities better than before". NPOs are de-registered by the DSD annually of which mostly are as a result of non-compliance to the NPO Act.

Table 2. Descriptive Statistics (n=200)

Items	Mean	Std. Deviation
Learning Construct		
I learned a lot on NPO Governance and compliance to the NPO Act from this training	2.92	1.151
I have forgotten most of what I learned from this training programme	4.16	.957
My newly acquired skills and knowledge qualify me for dealing with poor governance issues	3.43	1.226
My newly acquired skills and knowledge qualify me for dealing with NPO Act compliance issues	3.08	1.232
Training Content Construct		
The information provided in this training programme was easy to apply	3.10	1.178
The information offered in this training improved my professional competencies	3.07	1.096
The knowledge and skills required for my job were well supported by the practical activities and exercises of this training programme.	1.73	.775
The importance of applying training skills in the workplace was identified	3.09	1.138
Training Effectiveness Construct		
I have applied what I learned in the workplace	3.06	1.128
I am committed to utilizing the skills and knowledge from the training	3.03	1.086
I have transferred what I learned to my colleagues in the NPO	2.99	1.132
My NPO has improved its non-compliance and poor governance because of this training	2.99	.902
The training has helped in performing my roles and responsibilities better than before	2.28	.828

4.3 Results of the Hypothesis Testing

The study used regression analysis to test all the hypothesized effects. Means of dimensions and constructs were used to estimate the effects of training content on training effectiveness and trainee'learning on training effectiveness. A simple linear regression was used to test H1-H2. First, training effectiveness was regressed on training content to test H1. The results show that training content (β=0.830) exerted significant positive effects on training effectiveness. A significant regression equation was found (F (1,198) = 438.668, p<.001, with an R^2 of 0.689. Thus H1 was fully supported. Second, training effectiveness was regressed on learning to test H2. The results for Model 2 showed that "learning" (β=0.620) exerted significant positive effects on training effectiveness. A significant regression equation was found (F (1,198) = 123.626, p<.001, with an R^2 of 0.384. Thus, H2 was fully supported. Finally, training content and learning were incorporated into the regression model as independent variables to assess Model 3. The results of the regression showed that training content (β=0.710) and learning (β=0.206) exerted significant positive effects on training effectiveness ($R^2 = 0.717, F = 249.406$). Therefore, the results suggest that training content, acquisition, and transfer of skills and knowledge are predictors of training effectiveness.

Table 3. Correlation Analysis

		Learning	Training Content	Training Effectiveness
Learning	Pearson Correlation	1	.584**	.620**
	Sig. (2-tailed)		.000	.000
	N	200	200	200
Training Content	Pearson Correlation	.584**	1	.830**
	Sig. (2-tailed)	.000		.000
	N	200	200	200
Training Effectiveness	Pearson Correlation	.620**	.830**	1
	Sig. (2-tailed)	.000	.000	
	N	200	200	200
**. Correlation is significant at the 0.01 level (2-tailed).				

4.4 Correlation Analysis

The study examined the correlation between the construct to assess the nature and strength of the relationship between them. According to Table 3, learning construct has a significant and strong correlation with both the training content and training effectiveness. The association is positive for all constructs. The findings suggest that the training content and training objectives significantly and positively influence the transfer of training These findings are consistent with other research works that found training content validity (e.g., Singh, 2017) and content relatedness (e.g., Alkhanaizi, 2018; Bjerregaard et al. (2016) to have a positive influence on the transfer of training.

5. Conclusions

This study found a positive correlation between training content, trainee's learning and training effectiveness. Training effectiveness, as indicated earlier in the literature, is determined through the acquisition of new skills and knowledge (learning), and transferability of those skills back in the workplace. The study proves the fundamental value of ensuring that training content is relevant and easy to apply back in the workplace. Furthermore, practical activities and exercises during the training have proved to be crucial in allowing transferability of the training content. This was shown by the results whereby trainees indicated that they have not transferred what they were trained on; consequently, the was no improvement in their respective NPOs relating to poor governance and non-compliance to the NPO Act. Moreover, majority of the respondents indicated that the status of both governance and non-compliance to the NPO Act within their organisations have not improved even after attending the NDA training and there were no practical exercises or activities during the training, this can at least partly be attributed to the inadequate transfer of training which has resulted in a situation of training not being contributory in improving their governance and non-compliance.

Training organizations cannot ignore the importance of designing the training programmes in such a way that motivation to learn and transfer are increased and sustained. Additional research is necessary to look at other

training design factors, environmental factors that can increase the effectiveness of training. The NDA should consider a comparison analysis of the pre-training needs assessment and post-training a few months after the training has been conducted to be able to measure the return on investment. As far as the authors are aware, there is no published work on how training content and transfer of skills and knowledge has led to the effectiveness of training, especially within the non-profit space. Indeed, at present, research in the effectiveness of Government training in South Africa towards the improvement of the non-profit sector, especially compliance to the NPO Act is still in its infancy stages. However, work has been carried out to evaluate training effectiveness, but have not comprehensively considered the non-profit sector, especially in South Africa.

The research design applied is not without some methodological and theoretical limitations that should be noted. The data were collected from individuals who attended the training in Gauteng province only due to the geographical disperse of all NDA trained NPOs and the resource constraints associated with coverage of such dispersed geographical cover. Whenever possible, data to measure the effectiveness of an intervention should be collected from a larger sample in different provinces, multiple sources, including trainees, peers, other training institutions and the actual trainers who were involved in this particular training intervention. Also, it is reasonable to conduct evaluations that include a control or comparison group that has not received the intervention that is being evaluated. Therefore, further studies could use multiple sources, expand the geographical focus to all the nine provinces and include control groups.

Moreover, the findings are grounded on the NDA trained NPOs only, thus limiting the generalizability of the research findings. It is unclear whether the same pattern would occur in NPOs of other countries, and whether the results obtained from this survey would apply to other populations due to cultural differences. Future research could examine the cross-cultural aspects of this topic to determine the extent to which these results are specific to a province, country, sector or training area. Concerning the theoretical limitation, the study did not consider other factors influencing training effectiveness—factors such as individual characteristics, training design characteristics and environmental factors. Future research could examine the impact of these factors on training effectiveness of the NDA programme. The limitations indicated in this paper do not make the findings of this research less critical but instead mentioned to direct future research initiatives that could support more significant improvement in this area. Moreover, the NDA can further research on what motivates the trainees to learn new skills and transfer them back on the job. Since the training approach by the NDA was more theoretical than practical, it is further suggested that learning should be combined with training or teaching approaches as argued by Den et al. (2019) so that the NDA can understand if perhaps the teaching approach does not promote learning and its retention.

THE FINANCIAL DEVELOPMENT AND THE REAL ESTATE MARKET IN VIETNAM: A STUDY IN CASE OF THE GLOBAL FINANCIAL CRISIS

My-Linh Thi Nguyen [1], Toan Ngoc Bui [2]

[1] *Faculty of Finance and Banking, University of Finance – Marketing (UFM), Ho Chi Minh City, Vietnam*
[2] *Faculty of Finance and Banking, Industrial University of Ho Chi Minh City (IUH), Ho Chi Minh City, Vietnam*

E-mails:[1] ntmylinh@ufm.edu.vn; [2] buingoctoan@iuh.edu.vn

Abstract. This paper is the first empirical evidence for the impact of financial development on the real estate market (REM) in Vietnam. The researchers utilize time series data in Vietnam in the period from 2004:Q3 to 2018:Q4. By using the autoregressive distributed lag (ARDL) model, the paper analyzes the impact of financial development through the banking system development and the stock market development on the REM in the short and long term. The research results are consistent with some previous studies as the impact of financial development on REM is found in the short and long term, and the impact is mainly positive. In particular, the impact of the banking system development on the REM is stronger than the impact of the stock market development on the REM. In addition, the paper also achieves great success in discovering the negative impact of the global financial crisis on the In particular, the impact of the banking system development on the REM is stronger than the impact of the stock market development on the REM in the short and long term, which is a new discovery compared to the previous studies. These findings are significant for the In particular, the impact of the banking system development on the REM is stronger than the impact of the stock market development on the REM in the economies all over the world, especially for a developing country like Vietnam.

Keywords: ARDL; financial development; financial crisis; real estate; Vietnam

1. Introduction

The income variance around the world can be explained through the differences in the financial development across countries (Buera, Kaboski, & Shin, 2011; Buera & Shin, 2013). Accordingly, collateral used in loan agreements plays an important role. Indeed, in the countries with efficient financial development, solid development of banking system and stock market, financial services will be better than the countries with poor financial development (Bencivenga, Smith, & Starr, 1995; Esso, 2010; King & Levine, 1993; Bui, 2020).

Therefore, in the countries with efficient financial development, capital can be accessed from the stock market or the banking system (including mortgage of real estate for loans) (Nguyen, Xuan, & Bui, 2020). In the countries with poor financial development, the access to capital is mainly through real estate mortgages, which contributes to the decrease in financial market imperfections (Lim, 2018; Bui, 2019). The access to capital from the banking system or from the stock market helps households and enterprises to increase the capital for consumption and investment. Meanwhile, real estate is considered as both an investment and consumer goods (Kapopoulos & Siokis, 2005). Therefore, financial development could bring about an increase in real estate prices, possibly even forming the bubble phenomenon in the REM (Lim, 2018). However, a poorly supervised financial system may be vulnerable to crisis (Moshirian & Wu, 2012). The global financial crisis (which appeared in late 2007) is a testament to this and has a substantial impact on the REM (Antonakakis & Florosc, 2016; Nguyen & Bui, 2019). The global financial crisis can increase the risk in the capital market, causing negative impacts on the REM (Golob, Bastic, & Psunder, 2012). Therefore, financial development and the global financial crisis can have a dramatical effect on the REM. However, there are a small number of studies which focus on the analysis of the impact of financial development on the REM, like the study by Lim (2018). Almost no research has extended the analysis of the impact of the global financial crisis on the REM. For this reason, the researchers carried out this study to create the first empirical evidence for the impact of financial development on the REM in case of the global financial crisis. Especially, the research data were collected in Vietnam, a developing country with the primary access to capital from real estate mortgages; accordingly, the impact of financial development on the REM may have its own characteristics, different from the research results in developed countries.

2. Literature review

Financial development might be defined as the development of the aggregate size of the financial sector and the efficiency of individual components in the financial sector. The participants in the financial sector playing an important role include central banks, commercial banks, finance companies, insurance companies, stock markets, pension funds, and other institutions in the financial market (Zaman, Izhar, Khan, & Ahmad, 2012). Therefore, financial development includes both stock market development and banking system development (Pradhan, Arvin, Hall, & Bahmani, 2014). The impact of financial development on the REM is expressed through the theory of wealth effect. The wealth effect has long been mentioned in the studies by Friedman (1957), Ando and Modigliani (1963). Recently, this effect has been mentioned a lot in empirical studies, especially in developed countries. According to the wealth effect theory, consumption is a function of total assets and disposable income. Total assets and income have a positive impact on consumer spending. Total assets include financial assets (stocks, bonds), real estate and other assets. Real estate is considered as both an investment and consumer goods (Kapopoulos & Siokis, 2005). The wealth effect suggests that the wealth of households and enterprises will determine their consumption and investment behavior. Financial development will increase the value of wealth (assets and income) of households and enterprises. They will feel richer, which leads to the increase in spending and investment. As a result, the demand for housing and the investments in the REM have also increased, which will increase real estate prices, contributing to the development of the REM. In contrast, when financial development declines, the wealth of households and enterprises decreases. To ensure safety in the long-term and balance revenues and expenditures, they will cut down on spending and investment, resulting in the decrease in the REM. Overall, financial development has a significant impact on the REM.

Recently, Lim (2018) has indicated that the growth rates of real estate prices in the countries with efficient financial development are lower than in the countries with poor financial development. This is because in the countries with poor financial development, loans are mainly through real estate mortgages, which contributes to the decrease in financial market imperfections. This finding is consistent with the previous views of Shen (2013), Beck, Georgiadis, and Straub (2014), Mallick, Matousek, and Tzeremes (2016). In addition, some views argue that there is a positive impact of banking system development (which is measured through the ratio of the domestic credit to the private sector to GDP) on the REM, for example, in the studies by Bunda and Zorzi (2010),

Hott (2011), Huang, Leung, and Qu (2015), Shen, Lee, Wu, and Guo (2016). Simultaneously, some studies also found the positive effect of stock market development (measured through the stock index) on the REM, for instance, in the studies by Ibrahim (2010), Ni and Liu (2011), Tsai, Lee, and Chiang (2011), Ding, Chong, and Park (2014), Lean and Smyth (2014), Huang et al. (2015).

The wealth effect also refers to the influence of the macro-economy on the aggregate demand in the market, including the demand for real estate. This is because the macro-economy has an impact on the wealth of households and enterprises. When the macro economy is beneficial, households and enterprises have many favorable conditions to increase the value of their wealth, which leads to the increase in the demand for housing and the investment in the REM. In view of this, Ibrahim (2010) found the positive impact of economic growth and consumer price index on the REM during the period of 1995:Q1-2006:Q4. In addition to domestic macroeconomic factors, the global financial crisis also has a significant impact on the REM. In fact, the global financial crisis may increase the risks in capital markets, causing negative impacts on the REM (Golob et al., 2012). The global financial crisis has enhanced worries for policy-makers in emerging countries, especially worriesabout the risk of a crisis in the REM in these countries (Zhang, Cai, Liu, & Kutan, 2016). In case of the crisis in the REM, real estate prices will decline, the ability to pay bank loans will be reduced (due to unpaid real estate loans and collateral not enough to pay off the loans), which may lead to the arrival of a financial crisis (Zhao, Zhan, Jiang, & Pan, 2017).

3. Data and methodology

Regarding the research data, the authors conducted data collection in Vietnam, which is a developing country with a relatively young real estate market and limited financial development. The research data were collected by the authors on a quarterly basis in the period from 2004:Q3 to 2018:Q4. The authors were only able to collect the data in this period because the Vietnamese real estate market was officially established after Vietnam's 2003 Land Law came into effect on July 1st, 2004. Therefore, the General Statistics Office of Vietnam is the only organization that publishes the data on the Vietnamese real estate market and these data were published on a quarterly basis in the period from 2004:Q3 to 2018:Q4.

The paper analyzed the impact of financial development on the REM, with the use of the ARDL model proposed by Pesaran, Shin, and Smith (2001). The ARDL model was also used in the study by Lean and Smyth (2014). The ARDL model has the advantage of being appropriate for empirical studies using time series data with a small number of observations and in the case that the data series are not stationary at the same level I(0) nor I(1), but no variable is stationary in the differential series I(2) (Tursoy & Faisal, 2016).

The researchers measured the REM through the index of the REM growth announced by the General Statistics Office of Vietnam. For financial development, we measured it through the banking system development (domestic credit to the private sector to GDP - DCP) and the stock market development (Vietnam stock index - SI). In particular, the authors measured the DCP variable thanks to the findings in the studies by Bunda and Zorzi (2010), Hott (2011), Huang et al. (2015), Shen et al. (2016), Lim (2018). Regarding the SI variable, the authors measured this variable thanks to the research results of Ibrahim (2010), Ni and Liu (2011), Tsai et al. (2011), Ding et al. (2014), Lean and Smyth (2014), Huang et al. (2015). Moreover, the researchers added the variable of the global financial crisis to the study to create novelty compared to the previous studies. According to Hui and Chan (2014), the global financial crisis began in August 2007. This financial crisis might last until March 2013 (Cayon, Thorp, & Wu, 2017). Therefore, the financial crisis (FC) was measured by the dummy variable; FC receives a value of 1 for the period of the global financial crisis (from 2007:Q3 to 2013:Q1) and receives a value of 0 for the remaining periods.

Accordingly, the model of the impact of financial development on the REM in Vietnam has the following equation:

$$\Delta REM_t = \alpha_0 + \sum_{j=1}^{k} \lambda_1 \Delta REM_{t-j} + \sum_{j=0}^{k} \lambda_2 \Delta DCP_{t-j} + \sum_{j=0}^{k} \lambda_3 \Delta SI_{t-j} + \sum_{j=0}^{k} \lambda_4 \Delta FC_{t-j} + \sum_{j=0}^{k} \lambda_5 \Delta GDP_{t-j} + \sum_{j=0}^{k} \lambda_6 \Delta CPI_{t-j} + \beta_1 REM_{t-1} + \beta_2 DCP_{t-1} + \beta_3 SI_{t-1} + \beta_4 FC_{t-1} + \beta_5 GDP_{t-1} + \beta_6 CPI_{t-1} + \varepsilon_t$$

Or:

$$\Delta REM_t = \alpha_0 + \sum_{j=1}^{k} \lambda_1 \Delta REM_{t-j} + \sum_{j=0}^{k} \lambda_2 \Delta DCP_{t-j} + \sum_{j=0}^{k} \lambda_3 \Delta SI_{t-j} + \sum_{j=0}^{k} \lambda_4 \Delta FC_{t-j} + \sum_{j=0}^{k} \lambda_5 \Delta GDP_{t-j} + \sum_{j=0}^{k} \lambda_6 \Delta CPI_{t-j} + \phi\, ECM_{t-1} + \varepsilon_t$$

Table 1. Suggested research model

Variable name	Code	Source	How to measure
Dependent variable			
Real estate market	REM	GSO	REM mainly focuses on business activities in the REM, including three main areas: Commerce, leasing offices or houses, and consultancy (brokerage).
Independent variable			
Domestic credit to the private sector	DCP	IMF	The domestic credit to the private sector to GDP.
Stock index	SI	SSC	Logarithm of Vietnam stock index: log(VN-Index).
Financial crisis	FC	Author's computation	The dummy variable of the FC receives a value of 1 for the period of the global financial crisis (from 2007:Q3 to 2013:Q1) and receives a value of 0 for the remaining periods.
Control variable			
Economic growth	GDP	GSO	Quarterly growth of gross domestic product.
Consumer price index	CPI	GSO	Quarterly growth of consumer price index.
Note: GSO: General Statistics Office of Vietnam. IMF: International Monetary Fund. SSC: State Securities Commission of Vietnam.			

4. Empirical results

4.1. Descriptive statistics
The research data were collected on a quarterly basis in the period from 2004:Q3 to 2018:Q4, with the variables described in Table 2 below:

Table 2. Descriptive statistics

Variable	Mean	Min	Max
REM	0.0288	-0.0134	0.0587
DCP	0.2460	0.0798	0.6321
VN-Index	566.4624	231.22	1094.08
FC	0.3966	0	1
GDP	0.0659	0.0314	0.0945
CPI	0.0831	0	0.279
Note: VN-Index: Vietnam stock index.			

Vietnam is a developing country, with a young stock market (officially operating on 28 July 2000); the banking system still plays a crucial role in providing credit to the financial market in Vietnam (Batten & Vo, 2016). Therefore, the mortgage of real estate for bank loans is the main activity.
Figure 1. Growth of the domestic credit to the private sector (DCP)

DCP in Vietnam grew strongly in the first quarter of 2008, when the Vietnamese economy saw many positive signals with the expansion of production and business activities (Figure 1).
Figure 2. Vietnam stock index (VN–Index)

In 2007, with the positive signs from the fact that Vietnam officially became a member of the World Trade Organization (WTO), the Vietnam stock market grew hotly in the first quarter of 2007 (the stock index averaged 1035.589 points). Recently, Vietnam stock market peaked in the first quarter of 2018 (the stock index averaged 1094.08 points), exceeding the previous peak in the first quarter of 2007.
Figure 3. REM growth

With the hot growth from bank credit and the stock market, the capital into the REM amplified. This resulted in the high growth of the REM in the first quarter of 2008. However, after this period, with the negative impacts from the global financial crisis, the Vietnam REM plummeted. This decline lasted until the second quarter of 2012 because of the difficulties in accessing capital when the monetary policy tightened (Nguyen, Bui, & Nguyen, 2019). Recently, the world and domestic economies have recovered, which has contributed significantly to promoting the REM to grow again (Figure 3).

4.2. Unit root test

Table 3. Results of unit root tests

	REM	DCP	SI	GDP	CPI
AT LEVEL	0.1167	0.4706	0.3334	0.0449**	0.4612
AT Δ	0.0000***	0.0024***	0.0000***	0.0000***	0.0013***
Note: ** and *** indicate significance at the 5% and 1% level, respectively.					

The results of stationarity test suggested by Dickey and Fuller (1979) show that the variable of GDP is stationary in the I(0). In the meantime, the remaining data series are stationary in the I(1) at the 1% significance level (Table 3).

4.3. Cointegration test

The research paper measures the lag of variables in the ARDL model through the Bayesian Information Criterion (BIC). Bisgaard and Kulahci (2011) argued that identifying the optimal lag according to BIC is better than normal criteria. Furthermore, the paper also utilizes the bound test method recommended by Pesaran et al. (2001) to test the cointegration between the data series.

Hypothesis H_0: $\beta_1 = \beta_2 = \ldots = \beta_n = 0$ (there is no cointegration relationship between the data series).

Hypothesis H_A: $\beta_1 \neq \beta_2 \neq \ldots \beta_n \neq 0$ (there is a cointegration relationship between the data series).

Table 4. Results of the bound test of cointegration

F = 5.871			
p-value		I(0)	0.001[***]
		I(1)	0.006[***]
Note: [***] indicates significance at the 1% level.			

Table 4 shows that F is bigger than the I(1) proposed by Pesaran et al. (2001) at the 1% significance level. Therefore, there is a cointegration relationship between the data series at the 1% significance level.

4.4. Results of coefficient estimation

The analysis results regarding the impact of financial development on the REM according to the ARDL model are below:

Table 5. ARDL long-run and short-run results

| Variable	Coef.	Prob.
Long-run results		
DCP	0.1068	0.000[***]
SI	0.0404	0.001[***]
FC	-0.0195	0.000[***]
GDP	-0.1519	0.329
CPI	-0.0238	0.609
Short-run results		
△DCP	0.0981	0.002[***]
△DCP(-1)	-0.0876	0.003[***]
△SI	0.0280	0.002[***]
△FC	-0.0135	0.001[***]
△GDP	-0.1052	0.325
△CPI	-0.0165	0.608
ECM(-1)	-0.6923	0.000[***]
Constant	-0.0611	0.009[***]
R-squared	49.78%	
White's test	0.1319	
Breusch-Godfrey LM test	0.7428	
Ramsey Reset test	0.3839	
Note: [***] indicates significance at the 1% level.		
Figure 4. Plots of CUSUM squared statistics for coefficient stability tests

White's test shows that the research model has no homoscedasticity. Breusch-Godfrey LM test shows that the research model has no serial correlation. The Ramsey Reset confirmed that the functional form of the model does not suffer from omitted variables. Simultaneously, the paper conducted stability tests of the model through the CUSUM squared. The stability test suggested by Brown, Durbin, and Evans (1975) indicates that the CUSUM squared is within the standard range at the 5% significance level (Figure 4). Therefore, the research model has stability and appropriateness.

Table 5 shows that in the short and long term, the REM is impacted by financial development (DCP and SI) at the 1% significance level, and the impact is primarily positive. This impact is entirely consistent with the wealth effect theory. However, the REM is impacted greater by the DCP than by the SI. This is consistent with the reality because Vietnam is a developing country with the main capital into the REM stemming from the mortgage of real estate for loans. Therefore, it is understandable that the REM is strongly affected by the DCP. This result is consistent with the previous finding in the study by Lim (2018). In addition, at the 1% significance level, the researchers also find the negative impact of the FC on the REM in the short and long term. Meanwhile, the researchers have not found the statistically significant impact of GDP and CPI on the REM.

For the domestic credit to the private sector (DCP): In the short term, the DCP has a positive impact on the REM. However, with one lag, this direction tends to reverse. In the long term, the researchers also find the positive impact of the DCP on the REM. Therefore, the impact of the DCP on the REM is mainly positive. This suggests that the DCP plays an important role in increasing investments in the REM, thereby boosting the REM. This finding is consistent with the study by Bunda and Zorzi (2010), Hott (2011), Huang et al. (2015), Shen et al. (2016). Simultaneously, this finding is also consistent with the wealth effect theory. As a result, the DCP provided by the banking system may stimulate the development of the REM. However, if the capital in the REM increases excessively and is not strictly controlled, it can create a bubble phenomenon in the REM, and the occurrence of the global financial crisis in 2007 is a testament to this impact.

For the stock index (SI): In the short and long term, the SI has a positive impact on the REM at the 1% significance level. Therefore, when the stock market develops, investors in the stock market will increase their asset value and tend to increase the demand for housing and the investments in the REM. This will promote the development of the REM. This result is consistent with the previous findings in the studies by Ibrahim (2010), Ni and Liu (2011), Tsai et al. (2011), Ding at al. (2014), Lean and Smyth (2014), Huang et al. (2015). It can be said that the impact of the SI on the REM is completely consistent with the wealth effect theory.

For the financial crisis (FC): In the short and long term, the FC has a negative impact on the REM at the 1% significance level. Vietnam has achieved certain steps in the process of international integration. Therefore, it is inevitable that the REM is impacted negatively by the FC. When the global financial crisis appeared, the world and Vietnam economy faced many difficulties. The real estate transactions declined sharply and the real estate industry had difficulty in accessing capital. As a result, the REM would decline dramatically. The discovery of the statistically significant impact of the FC on the REM reflects the reality in Vietnam, and this is also a new finding of this research paper.

Conclusions

The paper shows the impact of financial development on the REM in both the short and long term, and the impact is mainly positive. In particular, the REM is impacted greater by the domestic credit to the private sector (DCP) than by the stock index (SI). This finding is completely consistent with the wealth effect theory. However, this finding represents the difference between Vietnam and developed countries, because the access to capital from the banking system plays a key role in developing countries like Vietnam. Simultaneously, with the analysis of the role of the global financial crisis, the paper achieves great success in finding the negative impact of the global

financial crisis on the REM in the short and long term, which is the new finding of this paper compared to the previous studies. This paper is the first empirical evidence in Vietnam for the impact of financial development on the REM. In addition, it is the first study to examine the role of the global financial crisis when analyzing the impact of financial development on the REM. Accordingly, the research results bring practical value to Vietnam. Furthermore, the research results also have important implications for the REM in the world's economies, especially for developing countries like Vietnam.

The research results show that financial development has an impact on Vietnam's REM in the short and long term, and the impact is mainly positive. In addition, the researchers find out the negative influence of the global financial crisis on the REM in the short and long term. Therefore, the world economy and the domestic financial development play a principalrole in Vietnam's REM. Thanks to that, the researchers suggest some policy implications as follows:

- The government of Vietnam should closely monitor the world economic situation, together with the improvement in the forecasts of the world economic situation. Thereby, there will be a foundation to apply suitable policies to boost the development of the economy and the REM in a sustainable way. In particular, it is essential to take advantage of the opportunities created by international economic integration and simultaneously to have appropriate policies to limit the negative impacts of the world economy.

- The government of Vietnam should also have an efficient policy on financial development, making the most of capital resources in the economy to stimulate the development of the REM. In particular, the government of Vietnam should attach considerable importance to the credit capital from the banking system and the capital resource from the stock market. However, it is necessary that the REM should develop in a sustainable way, meeting the actual demand in the market, and avoiding the formation of bubbles in the REM. This is because when bubbles are formed in the REM, the REM will be at risk of recession in the future. This will lead to negative effects on the economy, and the global financial crisis is a testament to this issue.

- This paper has achieved definite success in finding the first empirical evidence for the impact of financial development on the REM in Vietnam. However, this study also faces major limitations when it is impossible to collect data for each locality in Vietnam. Therefore, the researchers cannot analyze the impact of financial development on the REM in each locality. Meanwhile, each locality in Vietnam has its own characteristics of financial development as well as those of the REM. This is also a remarkable direction for further studies.

Abstract. At the OECD level, within the framework of taxation, relevant documents that directly concern the procedure for enhancing interaction and cooperation among its member states are being developed. The most important ones include the development of recommendations in the field of taxation of controlled foreign companies, including the study of current aspects in the event of a conflict between the provisions on controlled foreign companies and the concluded double taxation treaties. Meanwhile, in the study of the formation of the institute of controlled companies with regard to the manner of their formation and use of modern forms and methods of administrative control and tax liability, it is important to study actions in the sphere of international tax law. However, the emerging problems in this sphere are relevant, since, at the level of national legislation of each state, there are both objective and subjective factors that directly affect the formation of law enforcement practice on controlled foreign companies, with regard to a lack of scientific information in the context of national law. Therefore, in terms of improvement of the tax legislation of countries with developing economies that are reforming the institution of controlled foreign companies and supplementing them with new provisions which cover the basic aspects of the formation of taxation of controlled foreign companies in the digital economy, it is important to mention the urgent measures aimed at improving them, including ways of implementation and modernization of the rules and procedure for determining the profits of controlled foreign companies in terms of clarifying the list of passive taxes, as well as the composition of costs of such companies.

Keywords: tax residents; taxation in the digital economy; profit of controlled foreign companies; double taxation treaties

1. Introduction

The development of the global digital economy creates new challenges in the field of taxation and accounting, especially in relation to the regulation of the activities of the institute of controlled foreign companies. The use of various approaches to assessing the financial and economic activities of controlled foreign companies (CFCs) can provide sound tax control from the point of view of fiscal administration. What it involves is full compliance with the stages of control and verification of data for such categories of taxpayers (Alm, McKee, 2004), since in this case, it is possible to ensure that the assessment is performed at the appropriate level. As the basic criteria, the volume of assets generated and the amount of profit received can be used, as well as other indicators in the form of floor space, the number of staff, etc.

When recognizing for tax reasons in a particular jurisdiction, it is important to understand the established list of active and passive income, since other things being equal, a clear border between them may be insignificant (in the opinion of Brown & Petersen (2009). In this case, within a specific legal tax jurisdiction, taxpayers can manipulate the recognition of specific types of income (Comi et al., 2019), for example, when including in the tax base of a CFC the amount of profit received for ordinary activities or "conditional dividends" (Gryzunova & Ekimova 2018). Undoubtedly, this indicates significant problems that arise in terms of the qualification of income received under CFC within national jurisdiction, with regard to the current recommendations of the OECD, as well as subject to double taxation treaties.

2. Literature review

At the OECD activities level, relevant documents that directly concern the procedure for enhancing interaction and cooperation among its member states are being developed. In turn, an important stage is the development of tax rules for CFCs, including the development of recommendations in the case of contradictions between the provisions of the CFC and the concluded double taxation treaties (Perez-Alvarez et al., 2020).

The current provisions of the concluded OECD Convention include theoretical aspects of practical issues in the field of CFC taxation dealt with by economists and not fully developed. Thus, according to Porter (2003) studies, the legal rules of Luxembourg, Ireland, Belgium, and the Netherlands contain provisions contrary to the existing OECD conventions concerning the introduction of a permit for the taxation of CFC profits for persons being tax residents of third countries.

In turn, according to Becker et al. (2016) and Dzenopoljac et al. (2017), these provisions, introduced in the form of legal rules, are not restrictive for the parties to the transaction, as well as persons belonging to a CFC being tax residents in the case of taxation of third parties who are not tax residents of the mentioned states. Meantime, Arunraj & Ahrens (2015) research revealed an important component in relation to the CFC taxation procedure, since regardless of the effect of the residence factor of companies and individuals, the tax itself is calculated only in relation to the received amount of profit (Lehoux et al., 2018). These arguments are probably true. Therefore, the use of this approach for taxing the received amount of CFC profits in EU countries is irrespective of the parties to the transaction located in third countries, with respect to the existing double taxation agreements between the respective states and without the use of the right to tax the amount of "conditionally received dividends" (Abadie et al., 2004; Chae, 2015; Rahman and Bobkova, 2017).

It should be mentioned that in the context of digitalization of all spheres of the economy and taking into account the difficult macroeconomic situation in recent years, including the current one, primarily due to COVID-19, the problem of expanding the national tax law in relation to the taxation of CFCs (Edeigba et al., 2020) and narrowing the role of CFCs (Kiy & Zick 2020) arises for many states.

At least on a practical level, the existing double taxation treaties (DTTs) contain a reference to national legislation on the application of the right to income. This is about such countries as Canada (Article 91, Income Tax Law), France (Article 209, Tax Code). Simultaneously, exceptions on DTT are also contained in the tax laws of South Africa and Venezuela, Brazil, and Mexico. In this regard, in practice, the current CFC taxation procedure can be applied not only as a tool against "deferred taxation", as it was originally provided in the US legislation, and the goals and methods may be quite different. This is clearly stated in the OECD recommendations, since "they depend on whether a country adheres to the principle of export neutrality or import neutrality". Therefore, it is important to consider the further influence on cross-country relationships in the global digital economy when setting the ultimate goal of qualifying the recognition procedure for taxation of active and passive income at the level of national legislation.

3. Theoretical background

The study of the formation of the institute of controlled companies, taking into account the order of their formation and the use of modern forms and methods of administrative control in relation to the activities of CFCs, as well as implemented measures of tax responsibility, is an important aspect of the research performed by both theorists and practitioners in the field of international tax law. However, the emerging problems in this sphere are relevant, since, at the level of national legislation of each state, there are both objective and subjective factors that directly affect the formation of law enforcement practice in relation to CFCs, with regard to a lack of scientific information in the context of national law.

The global digital economy cannot be imagined without interconnected relations with major corporations (Korableva et al., 2018). In particular, the annual growth in the number of multinational corporations in the world that produce a significant number of goods (works, services) has significantly increased. Based on practical research data from Forbes' current rating of The World's Largest Public Companies, the top 100 largest multinational companies (MNCs) in the world for 2018 included 4 Russian companies: Gazprom, Sberbank, Rosneft, and Lukoil. The leading positions are occupied by MNCs that are actually located in the territory of the United States (30 corporations) and the PRC (21 corporations).

The current processes of economic integration directly concern the legislation of each country, on the basis of which financial relations are regulated with regard to the forms and methods of control over the activities of subjects of financial relations. Therefore, the current processes in the field of international finance should be controlled by the states, since this is necessary, first of all, in order to prevent tax violations. This is about increasing the potential for capital withdrawal to offshore jurisdictions and tax evasion by companies that operate in the international market (Fig. 1).
Figure 1. Comparative characteristics of separate offshore jurisdictions that maintain a register of beneficiaries and do not provide open access to the balance of current accounts about the final beneficiaries for 2019.
Source: Made by the authors based on information from https://knoema.ru/atlas and https://www.audit-it.ru

At the present stage, within the framework of globalization processes, there are stages on the way to the formation of special methods and forms of state financial control of such participants in financial relations. In the national tax practice, the appearance of provisions on CFCs since 2015 has had its own prerequisites both at the legislative level and in the form of economic grounds. At this time, like most countries, the Russian Federation initially provided the principle of separate taxation of profits received from organizations and shareholders/participants in the relevant legal entities, with regard to the principle of residency (Puryaev & Puryaev, 2020; Prodanova et al., 2019).

Thus, in Russia, as in the United States, when performing economic activities through the use of foreign companies, shareholders do not pay corporate income tax until this profit is distributed as dividends (until the amount of profit becomes the income of shareholders), or until the shareholders sell their shares in such a company. In this regard, before the adoption of the CFC tax rules, in Russia, in a similar way to the United States, the legislation allowed the possibility of evading national taxation through the creation of foreign companies with the participation of Russian shareholders.

In advanced economies, foreign company tax laws (CFC rules) are applied in various ways. Among them are: Australia, Great Britain, Germany, and the United States. In turn, the Russian rules for CFCs, which came into force in 2015, were constantly adjusted. Despite the more favorable nature of the amendments, the current approaches to CFC regulation have not been changed significantly, and adjustments have been made in respect of some shortcomings of the original version of the tax legislation.

Thus, within the framework of the national economy's deoffshorization being performed since 2014, the draft law on CFCs was a basic policy aimed primarily at establishing a mechanism for collecting and paying income tax in respect of controlled entities and companies (Abramova et al., 2014), as well as forming the procedure for recognizing legal entities as tax residents of the Russian Federation, with regard to the establishment of appropriate criteria, including the establishment of the procedure for "actual income beneficiary" when applying international double taxation treaties (Zhuravlev et al., 2019; Yemelyanov et al., 2020).

However, the peculiarity of the national legislation is that the profit received by a CFC is equal to the amount of profit received by the organization (individuals' income) recognized as the controlling person of this CFC. Meanwhile, the accounting for the CFC's profits is performed in accordance with the general procedure established by the provisions of national tax law, with certain features. The controlling entity includes legal entities or individuals with a share of more than 25% (before 2016 – 50%), or the participation rate of more than 10% if more than 50% of participating entities are recognized as tax residents of the Russian Federation. In certain cases provided by law, the CFC's profit is subject to tax exemption, in particular, if it belongs to non-profit organizations and is established in an EEU member state. In our opinion, the most relevant legal position is the procedure for calculating the amount of profit received within the CFC. For this, the following options for its definition are provided:
1)	based on financial statements (subject to certain conditions);
2)	according to the rules established for Russian companies based on the provisions of national tax legislation.

In determining the net profit received according to financial statements, it is important for taxpayers to comply with the following legal requirements: permanent location of the entity in relation to a foreign state with which the double taxation treaty is concluded or an audit report in respect of the statements without a negative opinion (refusal of opinion) is available. There are also certain types of legal requirements if the CFC's "personal law" does not establish rules for maintaining financial statements, or when a mandatory audit is not provided.
When determining the amount of profit received based on the application of national law, the necessary conditions must also be met for at least five subsequent tax periods. It is necessary to highlight that the amount of profit received from the CFC is subject to reduction by the amount of:
1)	dividends paid in the current tax period;
2)	tax paid in a foreign country. This operation should be document-wise, and if the Russian Federation does not have taxation agreement with the state (the location of the CFC), there should be provided a certification of the competent state authority.
The profit received from the CFC does not include the amount of profit aimed at increasing the authorized capital of the organization's participants. Another important aspect when establishing tax legislation in relation to CFC was the procedure for paying income tax on income received in the form of dividends from the CFC, if the amount of profit received from the corresponding CFC was previously reflected in tax return. In this case, taxpayers are required to provide regulatory authorities with payment documents confirming the payment of tax (Nagoyev, 2012).

Note that the established legal procedures related to the procedure for notification of participation in a CFC provide a general period for taxpayers – no later than 3 months from the date when the share of income received reached 10%. The opposite is also true: when the participation is stopped, the notification period will be the same. However, taxpayers are required to submit a CFC notification for the tax period no later than March 20 of the following calendar year. For its part, the tax service (if there is relevant information about such taxpayers) is obliged to send a corresponding request for explanations and notification about the CFC. Nevertheless, attention should be paid to the practical aspect of obtaining relevant legal information from Russian tax authorities in relation to the CFC, since the sources may include:
1.	Information contained in the notice provided by the taxpayer.

2.   Data received from the foreign competent authorities on the basis of an agreement on the exchange of tax information of the relevant state or on the basis of the OECD Convention on mutual administrative assistance in tax matters.

3.   When tax control measures are implemented by the local tax services within the framework of inspections connected with the collection of relevant evidence. When identifying the fact of control over a foreign company, the procedure for identifying the actual circumstances indicating such control is crucial. The following can be used for this purpose: witness statements, the results of the request/seizure of documents, other sources of information.

In this regard, it is necessary to analyze the greatest impact of existing tax and legal aspects in the qualification of active and passive income when regulating the determination of profits in respect of CFCs and their accounting for tax purposes.

4. Results

Based on the special report of the OECD adopted in 2015 in the form of "Designing Effective Controlled Foreign Company Rules", the most difficult aspect is the need to develop uniform unified rules for CFCs while maintaining freedom in relation to EU member states and the ability to develop their own regulations with regard to national specifics.

Certain it is that the established uniform approach in the field of legal regulation of CFCs in the EU countries is manifested in most member states on the basis of provisions that define:
 (1) concept of CFC and controlling person,
 (2) procedure for determining the main elements in relation to the taxation of CFC profits.

The OECD Report highlights current legislative approaches to regulating CFC taxation, including several main approaches that have the most practical application. The first option is a jurisdictional one, according to which the CFC tax regime is applied to companies based on their location with regard to the formation of a "white list" and "black list". The first refers to territories with high-tax jurisdictions, the second – to offshore or low-tax jurisdictions where the level of applicable tax rates is lower or even applies a rate of 0%, compared to the state of the controlling person. The jurisdictional approach is used in Germany, France, China, and other countries (Andersson, 2019). However, these states have different views regarding the criteria for the exercise of low-tax jurisdiction. For example, in France, a difference of 50% of the effective tax rate is set, while in Brazil there is no such order.

Another option is transactional, that is, the CFC tax regime is applied based on the type of activity performed by the CFC and the type of income received by the relevant company. In particular, in France, there are rules according to which the regime under consideration will not apply to a CFC if it is engaged in industrial activities (in other words, business).

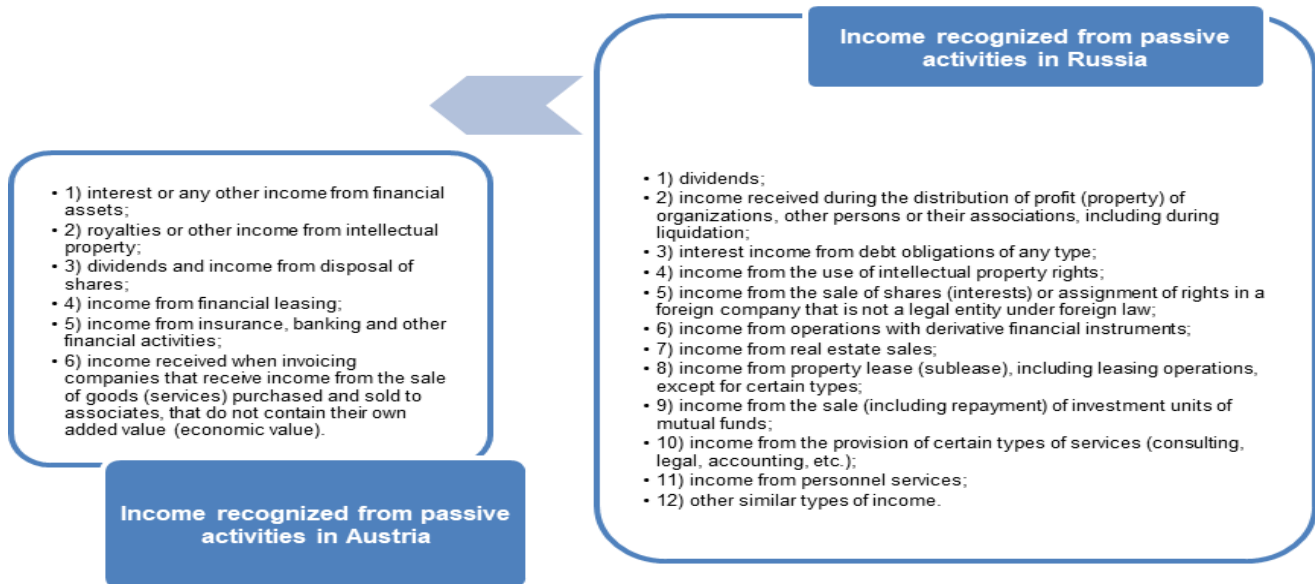
When conducting a comparative analysis between the EU states and the procedure applied in the national jurisdiction of the Russian Federation with respect to the rules provided by the current tax legislation, the ratio to any of the mentioned options (approaches) is incorrect. In this case, the term "mixed approach" is preferable. I.e., with respect to the application of the jurisdictional approach, the main provisions related to CFC will apply. Especially emphasize that the application of a mixed approach is more characteristic of the German tax system, where only the passive income of a CFC is taxed, but at the same time, this type of income will be taxed if the effective tax rate for this type of income in the country of location of the CFC is less than 25% of the rate set in the country (Savitskiy, 2015).

Within the framework of the analysis of the most significant areas, with regard to the procedure for improving national legislation in the field of taxation of CFCs, it is important to highlight that significant changes have been made since 2019, which directly affected the current procedure for determining the profit of CFCs. In this regard, these provisions will be applied by the business for at least the next five tax periods, starting from 2020, so it is important to mention the most important ones. Since a number of changes have been made to the tax legislation in recent years related to the adjustment of the current procedure for applying the CFC rules in the field of taxation, these innovations, based on current practical experience, are harder in relation to the taxpayer, since they only increase control over it.

Within the main directions for improving the current legislation in the field of CFC taxation in the Russian Federation, it concerns an important provision in the procedure for determining CFC profits. Until the tax period of 2019 in determining the profits of a CFC, the income received in the form of dividends sourced from the Russian organization were not considered, but it was required to comply with the mandatory conditions: the controlling person for such a CFC should have had the actual right to dividends.

Based on changes made since 2019, when determining the profit of a CFC, the amount of passive income from Russian companies was not taken into account, if their actual recipient was a person controlling the CFC. The list of passive income includes loan interest, as well as royalties from the use of intellectual property.

As a comparative characteristic, the changes in the current tax procedure for CFCs will be considered through the example of Austria, which came into effect in 2019 relative to adjustments made for passive income received. The current CFC rules provide the inclusion of income in the tax base of an Austrian corporate shareholder who directly or indirectly owns a controlling stake in a foreign enterprise if such an enterprise generates passive income with a low level of taxation (offshore jurisdictions). However, tax control is performed if the Austrian company owns, directly or indirectly, with its subsidiaries more than 50% of the share rights or capital. The following types of CFC passive income are subject to mandatory inclusion in the tax base of the Austrian parent company from 2019, namely:

1) interest or other income from financial assets;
2) royalties or other income from intellectual property;
3) dividends and income from the disposal of shares;
4) income from financial leasing;
5) income from insurance, banking, and other financial activities;
6) income received when invoicing companies that receive income from the sale of goods (services) purchased and sold to associates, that do not contain their own added value (economic value) in their cost. In this regard, the list of passive income in the Russian and Austrian tax systems is different (Fig. 2).


Income recognized from passive activities in Russia

- 1) dividends;
- 2) income received during the distribution of profit (property) of organizations, other persons or their associations, including during liquidation;
- 3) interest income from debt obligations of any type;
- 4) income from the use of intellectual property rights;
- 5) income from the sale of shares (interests) or assignment of rights in a foreign company that is not a legal entity under foreign law;
- 6) income from operations with derivative financial instruments;
- 7) income from real estate sales;
- 8) income from property lease (sublease), including leasing operations, except for certain types;
- 9) income from the sale (including repayment) of investment units of mutual funds;
- 10) income from the provision of certain types of services (consulting, legal, accounting, etc.);
- 11) income from personnel services;
- 12) other similar types of income.

- 1) interest or any other income from financial assets;
- 2) royalties or other income from intellectual property;
- 3) dividends and income from disposal of shares;
- 4) income from financial leasing;
- 5) income from insurance, banking and other financial activities;
- 6) income received when invoicing companies that receive income from the sale of goods (services) purchased and sold to associates, that do not contain their own added value (economic value).

Income recognized from passive activities in Austria

5. Discussion

One of the important directions for improving the tax legislation in relation to CFCs is the inclusion of "capital amnesty" in the legal doctrine. This refers to the return to the national jurisdiction of the income of persons who do not live in the country for any reason (Almas, 2012). Nonetheless, according to Akamah et al. (2018), the tax incentive is the right for such categories of persons not to pay tax on the CFC's profits under the defined conditions.

A new direction in the studies of Coolidge (2012) is that in the case of a voluntary provision of CFC tax return by its controlling person (entity), the taxpayer will be exempt from penalties caused by delayed reporting. Besides, guarantees regarding the preservation of the CFC will be provided (apart from disclosure) if the CFC changes the country of registration, preserving all existing business relationships within specific jurisdiction through the procedure of re-domiciliation.

Therefore, in the authors' opinion, such a CFC can be registered as an international holding company (hereinafter IHC). However, with respect to statutory provisions, such a company shall make an investment in the national economy in the amount of not less than the threshold value (not less than 50 million rubles) within at least six months from the date of state registration of the respective company as an IHC. In this case, the capital amnesty procedure is a voluntary declaration in relation to a CFC, with regard to the provision of guarantees of exemption from penalties after redomiciling (Ferziger, 2013).

The conducted research aimed at improving the tax regulation of CFC activities has an important goal of stimulating the redomiciliation of CFCs into national jurisdiction only in special administrative regions located on Russky Island (Primorye Territory) and Oktyabrsky Island (Kaliningrad Region) for the purpose of obtaining the IHC status. It is important to take into consideration that, in practical terms, the redomiciliation procedure is possible not from all states (Leoncini et al., 2020). In particular, a company registered and operating in the territory of the British Virgin Islands (so-called BVI companies) cannot be re-domiciled (change of jurisdiction) to the Russian Federation directly. However, this is possible from other jurisdictions, for example, Cyprus (Akhmadeev et al., 2016; Akhmadeev et al., 2019). Therefore, in practical terms, it is possible to implement a two-stage redomiciliation from the British Virgin Islands through the jurisdiction of Cyprus.

Conclusion

According to the results of the study, it can be concluded that as part of improving tax legislation, countries with developing digital economy are reforming by adding new provisions regulating the basic aspects of the formation of CFC taxation. As for the Russian Federation, the main directions are to clarify the tax legislation for a more practical determination of the amount of profit received by a foreign company calculated in accordance with financial statements based on the company's personal law for the corresponding financial year. The term "personal law" originally referred to the operation of the legislation of the state, at the place of incorporation of the legal entity. At the same time, the profit received by a foreign company in foreign currency must be recalculated for the period based on the average exchange rate of the Bank of Russia. According to Bykanova et al. (2018) and Lehoux et al. (2019), this approach implied the formation of basic approaches to DE offshorization of the economy, according to which, the Russian legal doctrine established for the first time that the profits of foreign companies owed to Russian shareholders could be taxed even before the distribution as dividends (Ghosh & Maji, 2015).

An important tax change for taxpayers is also the consideration of the practical situation when interacting with offshore jurisdictions. These are cases when a CFC is registered in the territory of the relevant offshore territory and does not submit financial statements, and does not pay taxes. In this case, the CFC will not have the right to reduce the calculated profit tax. This approach of regulatory authorities has been analyzed when considering the general procedure for the interaction of companies with offshore jurisdictions and the list of states and territories that do not provide information exchange with national states for tax purposes is updated annually at the legislative level. In this regard, the following are the priority measures aimed at improving the legislation in the field of taxation of CFC activities.

First, the modernization of the rules and procedure for determining the CFC's profit in terms of clarifying the list of passive taxes, as well as the composition of the CFC's expenditures.

Second, the list of states and territories that do not exchange tax information with other jurisdictions should be periodically updated.

Third, the use of capital amnesty in the framework of voluntary provision of tax return of a CFC by its controlling individual, which will allow such a person (subject to a number of conditions) to be exempt from penalties that were caused by a violation of the reporting terms.

Fourth, the elimination of inconsistency of CFC rules in the EU countries, since the legal regulation of various areas of taxation reveals a trend leading to the gradual rejection of tax sovereignty in the European economic community, and against the background of quite consistent and successful unification of EU tax rules in specific areas, the problem of inconsistency of CFC rules in the national jurisdictions of EU member states remains unresolved and urgent. Therefore, the pursuit of a fiscal goal by the state in terms of regulating CFC legislation is

acceptable in the short term, while in the long term, it may have a negative impact on the country's economic development and, as a result, on the development of the digital economy in general.

TRANSITION MATRIX AND STOCHASTIC KERNEL FOR REPEATABILITY ASSESSMENT OF PERFORMANCE OF POLISH OPEN PENSION FUNDS[*]

Rafał Buła

University of Economics in Katowice, 1 Maja 50, 40-287 Katowice, Poland

E-mail: rafal.bula@ue.katowice.pl

Abstract. This study focuses on the issue of repeatability and reversal of performance achieved by Polish open pension funds. For the choice of the fund investing the contributions of the future pensioner, the phenomenon of repeatability and reversal of its performance is essential. Otherwise, historical rates of return cannot be used to predict future ones, and in that case the only rational method of choosing a pension fund is a pure random selection. Contrarily to the other studies taking into account numerous variables describing open pension funds, the author analyzes the only one variable interesting from a future pensioner's viewpoint: rate of return. As a consequence the formulated conclusions are not flawed due to considering factors having no influence on future pensioners' wealth. The analysis of these phenomena was carried out by adopting the dynamics of distribution testing methods. The estimated Markovian transition matrix and the conditional density function allowed us to formulate the conclusion about the weak performance repeatability of pension funds.

Keywords: pension fund; Markov chain; performance repeatability; transition matrix; stochastic kernel

1. Introduction

One of the consequences of the controversial Polish pension system reform carried out in the 1990s (sometimes called "the privatization of the pension system") (Żuk & Żuk, 2018) was the emergence of a new category of financial market participants – open pension funds (Góra, 2018), (Góra & Rutkowski, 1998). Their essential function is, above all, the investment of funds received in the form of contributions to achieve the maximum level of security and profitability of investments (Styczeń & Gomułka, 1999). Since every investment activity is subject to riskiness, it has become necessary to introduce legal solutions to protect future pensioners from taking unacceptably excessive risks and inefficient management of the investment portfolio leading to pensioners' wealth erosion (Parvi, 2014). To this end, the legislature provided the fund members with the possibility to

---

change the fund and specified the minimum rate of return that the fund must achieve in order to be able to continue operating (Kominek, 2012; Kompa & Wiśniewski, 2015a). Competition between funds was to lead to the exclusion of inefficient entities, the anticipated creation of new funds was to prevent market monopolisation while legal regulations were to diminish the agency problem (Samborski, 2014). Without determining whether the described mechanism actually works (see, for example, (Brzeszczyński, Bohl, & Serwa, 2019; Chybalski, 2008, 2012; Witkowska & Kompa, 2017; Witkowska, Kompa, & Mentel, 2019)), it should be noted that for the choice of the entity investing the contributions of the future pensioner, the phenomenon of repeatability and reversal of the pension fund performance is vital. Otherwise, historical rates of return cannot be used to predict future performance, and then the only rational method of choosing a pension fund is a pure random selection. Therefore, the scientific purpose of this study is to examine the hypothesis that the performance of open pension funds operating on the Polish market is characterised by repeatability.

By repeatability of pension fund performance it is meant delivering consistently good (repeatability of success) or bad performance (repeatability of failure) in subsequent periods. There is also an opposite phenomenon to repeatability – reversal, i.e. obtaining good performance after recording bad one or bad performance after good one. The described behaviour of rates of return enables systematic achievement of better performance than others by making the proper selection of the fund or by changing it. If the phenomenon of repeatability or reversal does not occur, then forecasting the future value of accounting units is not effective and does not lead to an above average increase in future retirement benefits.

Despite significance of the raised issues not only for future pensioners, but for the whole economy, the described problem has not been thoroughly investigated. The conducted research in this field of study has been mainly devoted to the static analysis of efficiency of open pension funds. As a consequence various types of comparisons between performance of open pension funds and mutual funds, multitude of benchmark indices as well as obligatory social security fund have been presented in the literature. Unfortunately, this type of analysis is of purely static nature – it informs about past events, but the linkage between future and the past is lost. Without any additional assumptions about intertemporal relations between performance of open pension funds, the future pensioner is in reality unable to make any rational decision. It is naturally possible to assume tacitly that the future will resemble the past, but without any empirical evidence it simply becomes the classic induction problem, unsolved since it was stated by David Hume (Duignan, 2007). Alas, there are practically no empirical inquiries tackling this issue in case of Polish open pension funds. The existing research gap will be covered in this study.

There are many methods for studying the phenomenon of performance repeatability. Many of them were created in order to indirectly verify the hypothesis of strong efficiency of the capital market stating that all information (even confidential) is reflected in the prices of financial instruments (Fama, 1970). Efforts were made to prove that entities suspected of having insider information, i.e. investment and pension funds, are not able to systematically achieve better performance than the market. Although this approach is criticised by proponents of behavioural finance, it has provided many valuable tools to study the repeatability phenomenon. These include methods of distribution dynamics analysis used in this study. The novelty of the research is the application of the distribution dynamics analysis to the performance of Polish open pension funds, what has not been done before. As a result, the new and interesting results can be obtained and conclusions germane to participants of the Polish open pension funds scheme formulated.

The paper is organized as follows. Section 2 describes the capital pillar of Polish pension system – its history, investment policy of open pension funds and their performance. Section 3 includes the literature review regarding the efficiency of open pension funds. Section 4 describes theory of Markov chains and concept of stochastic kernel applied in this study as well as data analysed. Section 5 presents results obtained and discussion while the last section concludes.

2. Polish open pension funds market

The reform of the Polish pension system formally began in January 1999. The implementation of this fundamental change to then existing social security system was forced by necessity of controlling its finances in the short term as well as dramatically worsening long-term aged dependency ratio. Mere continuation of the PAYGO scheme became impossible as retirement spending in 1990-1994 increased from 8.5% to 15.6% of GDP and the "positive demographic dividend" transformed into "negative demographic dividend" (Błaszczyk, 2020). As a consequence a three-pillar system was created by adding to the obligatory PAYGO system (modified by introducing defined contribution scheme instead of defined benefit scheme) two additional capital pillars: one mandatory and the facultative third one. Connecting the amount of the future pension with individual contributions of workers during period of their labour activity was to lead the whole pension system to become self-financing in the long-term to reduce the burden to public finances.

The entities intended to manage the contributions paid in to the capital pillar of the pension system (initially 7.3% of gross salary vs. 12.2% charged by the Social Security Institution responsible for governing the first pillar fund) were the open pension funds (*otwarte fundusze emerytalne*, OFE). According to the intentions of the reform's authors transforming workers into participants of the open pension funds market should have created incentives for managers to maximize wealth of contributors due to heavy competition between them (Bugaj, 2018). It was strongly believed that the capital pillar would outperform the mandatory PAYGO first pillar and result in significant growth of future pensions. Moreover, the predicted additional supply of funds should have led to accelerated development of domestic capital market.

From today's perspective the history of open pension funds in Poland can be divided into three periods: the period of dynamic development (1999-2011), the transitory period (2011-2014) and the period of stagnation (2014-2020). They are analysed using such measures of development of open pension funds market like number of members, value of net assets or number of funds (Chybalski, 2005).

During the first period of existence the number of members of open pension funds rose rather steadily while the market was consolidating as number of operating pension funds fell from 20 in 1999 to 14 in 2011.

Fig. 1. Number of members of open pension funds and operating pension funds in Poland

Source: Own elaboration based on data provided by Financial Supervision Authority

The average contribution to the capital pillar of pension system remained constant at relatively high level. Consequently, at the same time a strong increase in net assets of open pension funds could have been observed (20.4% p.a.), partially due to steady inflow of contributions and partially as an effect of rising financial market. The first significant doubt about the shape of capital pillar of pension system was connected with global financial crisis 2007-2009 (Kołodziejczyk, 2019). The rapid decline of prices wiped off a substantial part of future pensioner's wealth and raised question about level of risk open pension funds participants were exposed to. The inflow of contributions was counterweighted by plummeting asset prices and as a result net assets of open pension funds declined slightly despite still increasing number of participants. Moreover, as the crisis put public finances under heavy pressure, a discussion regarding the efficiency of the existing reformed pension system and its influence on public debt became widespread.

Fig. 2. Net assets of open pension funds and their share in GDP

**Fig. 3.** Contributions paid in to open pension funds as share in GDP

Source: Own elaboration based on data provided by Financial Supervision Authority

After the crisis the combined effect of growing financial markets and increasing contributions due to the economic recovery resulted in fast growth of funds' assets and continuation of the trend in case of the number of

987

the members. Nevertheless, the undermined trust in capital pillar of the pension system and budget difficulties led the government to gradual reduction of the open pension funds sector (Chybalski, 2014; Gubernat, 2013; Jakubowski, 2016). Firstly, in May 2011 the contribution to the open pension funds was reduced by 68% (from 7.3% of gross salary to 2.3%) and the difference started to be transferred to Social Security Institution. Additionally, the investment limits of open pension funds were changed to allow them to gradually invest more funds in equities (we do not discuss here changes to the remaining pillars of the pension system, e.g. the raised minimum retired age, as they are not explicitly connected with functioning of open pension funds). Secondly, in February 2014 net assets of open pension funds were reduced by 51.5% due to transferring them to Social Security Institution (government bonds and government-backed securities) and at the same time funds were disallowed to invest in these types of instruments in the future. Also the obligation of investing at least 75% of assets in shares was introduced and the limits regarding investing in more risky types of instruments as well as foreign ones were liberalized. Moreover, the open pension funds participants were given the possibility of choosing once again whether they wanted to continue to contribute to the capital pillar of the system or the whole contribution should be transferred to the Social Security Institution. Only about 15.4% members decided to contribute to open pension funds (Błaszczyk, 2020). This meant radical diminution of the amount of contributions paid in to the funds (the existing assets were not withdrawn from open pension funds) despite a slight increase in the level of the individual contribution (2.92% of gross salary). Finally, the funds were obliged to gradually transfer assets of their participants starting from 10 years before reaching retirement age to the Social Security Institution. The effects of the abovementioned changes are perfectly visible on fig.2 and fig.3.

Fig. 4. Herfindahl-Hirschman index for open pension funds

Source: Own elaboration based on data provided by Financial Supervision Authority

The last period of existence of open pension funds lasting from 2014 till now is characterised by slow erosion of importance of open pension funds. The falling number of these entities (reduction from 20 by half) still manage relatively large funds (now concentrated on the stock market), but due to small group of active members (i.e. paying in contributions) and gradual withdrawal of funds of retiring participants their net assets are continuously declining. The values of Herfindahl-Hirschman index (Rhoades, 1993) show that despite this decline, the open pension funds market did not become more monopolistic (as relatively small funds disappeared from the market).

The future remains unclear. It was almost decided by the government that open pension funds would be converted into specialized open investment funds and only voluntary payments by their participants would be allowed (while still having option of transferring all pension savings to special fund administered by Social Security

Institution). The agreed time to introduce these changes was summer 2020, but due to the SARS-CoV-2 pandemic they were postponed.

Fig. 5. Structure of investment portfolio of open pension funds

Source: Own elaboration based on data provided by Financial Supervision Authority

Fig. 6. Cumulated logarithmic rate of return of average open pension fund, benchmark and Social Security Institution

Source: Own elaboration

The decisions regulating the open pension funds market have a clear reflection in structure of portfolio held by these entities. Till February 2014 the main type of financial instruments the funds invested in were Treasury bonds and bills (63%-78%) (Bolisęga, 2013; Czerwińska, 2011; Trippner, 2012). Approximately 1/3 of assets consisted of equities. This mix of various types of assets remained relatively stable till 2014 due to only slight changes in investment limits (e.g. open pension funds were allowed to invest up to 50% of their assets in equities before 2011, 52.5% in 2011, 55% in 2012, 57.5% in 2013 and 60% in 2014). A dramatic shift in the structure of assets held by open pension funds occured in 2014 after enacting a ban of investing in Treasury securities and transferring them to Social Security Institution. At the same time the minimum limit of equities held equal to 75% was introduced (it would decrease year by year: in 2015 to 55%, in 2016 to 35%, in 2017 to 15% and then

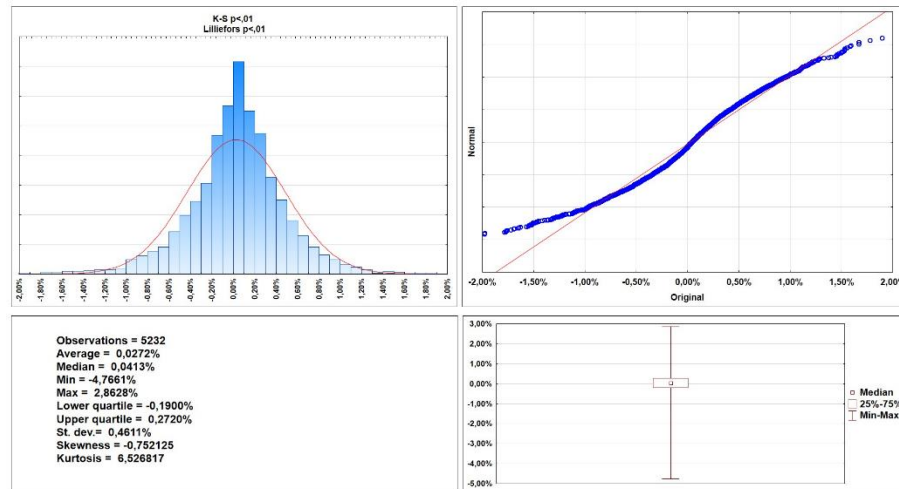
abolished). As a result equities became the main component of portfolios of open pension funds (approx. 85%) and despite reduction of their net assets more than by half, they remained one of the most important investors on Warsaw Stock Exchange. Moreover, this situation is quite unsual from worldwide perspective as pension funds are exposed to huge level of investment risk (Jakubowski, 2015). This solution is widely criticised by specialists as disallowing the pension funds to create freely more secure strategies (Kompa & Wiśniewski, 2014, 2015b; Kompa & Witkowska, 2015b; Lisowski, 2015).


Fig. 7. Histogram, QQ-plot and box chart of daily rates of return of average open pension fund

Source: Own elaboration
Fig. 8. Smoothed monthly distributions of daily rates of return of open pension funds

Source: Own elaboration

The imposed investment limits are perceived as a main cause of similarity between performance of open pension funds (Frasyniuk-Pietrzyk, 2008; Kompa & Witkowska, 2015a). Fig.6 shows cumulated logarithmic rates of return achieved by average fund, constructed benchmark and Social Security Institution. Before 2014 there was

no benchmark against which performance of funds could have been compared. The so called minimum rate of return was a function of average return of all funds, so it could not have been used as an independent benchmark (Jonas, 2010). As a result as benchmark was chosen a portfolio built from main Warsaw Stock Exchange index – WIG and 3M WIBOR (treated as equivalent to short-term risk-free rate) in proportions given by average portfolio of all funds. In 2014 a legal benchmark was introduced defined as portfolio built from WIG (80%) and 3M WIBOR increased by 50 bp (20%). It can be noticed that for most of the analyzed time the performance of open pension funds did not differ from benchmark while it outperformed significantly the Social Security Institution.

Statistical summary (fig.7) shows that as usually in case of financial time series the fat-tails can be observed (normality hypothesis rejected) as well as negative skewness. Fig.8 illustrates the smoothed monthly distributions of daily rates of return of open pension funds. The increase in risk exposure after 2014 is perfectly visible from the shape of the distributions drawn.

3. Literature Review

The modern analysis of performance of collective investment institutions has begun when the famous investigation by Michael Jensen was published (Jensen, 1968). Since then numerous analyses of this issue have been prepared. Unfortunately, in Poland the history of contemporary collective investment institutions is significantly shorter as these institutions could have been allowed to operate only after abolishing the centrally planned economy in early 1990s. The research devoted solely to the results achieved by pension funds began to be published after the reform of the pension system in 1999. The problem of efficiency of the newly created open pension funds became widely discussed.

The first studies analysing performance of Polish open pension funds concentrated solely on rates of return achieved by these entities (Borowski, 2004; Czechowska, 2002; Trippner, 2008). Generally it was emphasized, that the results were satisfactory from future pensioner's point of view. Unfortunately, these studies covered a very short period of time. Moreover, the authors did not take into account the problem of investment risk what makes their conclusions dubious.

The financial crisis of 2007-2009 attracted the attention of the researchers to the problem of including risk into their investigations regarding the efficiency of Polish open pension funds. Most of the studies taking into account riskiness of funds investments exploit the widely known measures connected with Capital Asset Pricing Model of Treynor, Sharpe, Lintner and Mossin and single-index model created by William Sharpe and their modifications.

(Zimny, 2011) emphasizes that risk (previously a "hidden" parameter) must be taken into account while assessing the performance of open pension funds. The presented analyses using Markowitz efficient frontier idea and Sharpe ratio confirms that open pension funds are mean-variance efficient. Moreover they are not better nor worse than benchmark index constructed from WIG index (40%) and 3M WIBOR (60%).

Witkowska et al. (Kompa & Witkowska, 2014, 2015a, 2016b, 2016a; Witkowska, 2018; Witkowska & Kompa, 2015, 2017; Witkowska et al., 2019) in a series of studies investigated the efficiency of open pension funds using a wide variety of measures (i.e. mainly risk to reward ratios). The general conclusion is that open pension funds perform better than Social Security Institution, most benchmarks and stable-growth mutual funds (i.e. mutual funds characterised by the most similar investment policies).

Table 1. Results of studies analysing efficiency of Polish open pension funds (OPF)

Study	Period	Methods	Conclusions
(Czechowska, 2002)	1999-2001	Comparisons of rates of return	OPF achieve the aim of increasing wealth of future pensioners
(Borowski, 2004)	1999-2003	Comparisons of rates of return	OPF are highly efficient
(Trippner, 2008)	1999-2007	Comparisons of rates of return	OPF achieve the aim of increasing wealth of future pensioners
(Frasyniuk-Pietrzyk, 2008)	1999-2007	Jensen alpha	OPF are not worse nor better than benchmark
(Zimny, 2011)	1999-2011	Efficient frontier analysis, Sharpe ratio	OPF are mean-variance efficient
(Rusielik, 2011)	2009	Data Envelopment Analysis, Stochastic Frontier Analysis	Most OPF are effective
(Kompa & Witkowska, 2014)	1999-2013	Comparisons of rates of return, Sharpe ratio, Treynor ratio	OPF beat benchmark independently on market conditions

992

These conclusions were confirmed by results of the research carried out by (Dziwok, 2015; Lisowski, 2015; Rusielik, 2011; Wyszyński, 2018) using methods as different as hierarchical clustering (Ward's method), imperfect foresight analysis or Data Envelopment Analysis and Stochastic Frontier Analysis. On the other hand there exist studies showing that abilities of managers of open pension funds are quite similar to skills of managers of mutual funds (Frasyniuk-Pietrzyk, 2008; Żebrowska-Suchodolska & Karpio, 2014). It is also noticed that their ability to select outperforming companies and instruments is rather poor, so they rather simply follow the market (Frasyniuk-Pietrzyk & Pietrzyk, 2014; Karpio & Żebrowska-Suchodolska, 2017).

Besides analysis of performance of open pension funds against an external benchmark also the issue of similarities between results of particular funds were investigated. Taking this problem into consideration from theoretical point of view, the existence of the so called minimum rate of return calculated as an internal benchmark based on the collective performance of the open pension funds induced "herd" behaviour of funds. As a consequence most studies show that independently of the performance measure adopted (Jensen alpha, Sharpe ratio, Sortino ratio, etc.) and method of analysis (hierarchical clustering, ANOVA, etc.) the results of open pension funds are hardly distinguishable (Frasyniuk-Pietrzyk, 2008; Kompa & Witkowska, 2015a; Lisowski, 2015; Marcinkiewicz, 2015; Mikołajczak & Bajak, 2017). There are also studies claiming lack of homogeneity of the analysed entities, but it can be observed that these conclusions are based on multicriteria techniques taking into account also net assets, number of members of funds, etc. (Franków, 2015; Obidziński, 2008). Due to significant differences between characteristics other than rates of return employing multicriteria techniques inevitably leads to misleading conclusions of heterogeneity while from the future pensioner's viewpoint the only important variable is achieved rate of return.

The abovementioned studies concentrate on analysis which might be called static as it does not take into account possible (and quite probable) changes in variables describing particular entities in time. The importance of stability of results achieved by particular open pension funds for future pensioners is obvious. The main result are summarized in tab.2.

Table 2. Results of studies analysing changes in characteristics of Polish open pension funds (OPF)

Study	Period	Methods	Conclusions
(Miszczyńska, 2003)	2001-2002	PROMETHEE, AHP	Performance of OPF is stable over time
(Miszczyńska, 2004)	2004-2005 (forecasts)	PROMETHEE, AHP	Performance of OPF is stable over time
(Mikulec, 2008)	2002-2007	Taxonomic measures, Walesiak measure, Kendall's tau	Performance of OPF is stable over time

Source: Own elaboration

Most studies provide arguments in favour of the hypothesis that results of open pensions funds are characterized by time stability (Buła, 2014; Kucharski, 2011; Mikulec, 2008; Miszczyńska, 2003, 2004). What must be remembered while formulating conclusions based on this empirical evidence is the method used by the authors.

They do not concentrate solely on rates of return, but exploit multicriterial analysis investigating also e.g. net assets, number of the members, level of fees etc. The common practice in this case is to consider multiple criteria while calculating appropriate taxonomic measures and most of the abovementioned variables are stable over time. The persistence of the resulting measure is a simple consequence of the normative assumption that performance of open pension funds is measured by taking into account a variety of different variables. But from the point of view of a single pensioner the only significant characteristic is rate of return. Quite contrarily to the previous results, in this case almost the pure randomness can be observed over time (Białek & Mikulec, 2009; Bukietyńska, 2017; Włodarczyk, 2010). An additional confirmation of these results are conclusions drawn by (Chybalski, 2011; Jędrzychowska, 2011). According to their analyses of connections between funds performance and members transfers there does not exist any dependence between rates of return of particular fund and inflow of members to it. Assuming rationality of *homo oeconomicus* this result is not surprising.

Unfortunately, the number of studies analysing repeatability of rates of return solely is rather small and they regard only the first years of functioning capital pillar of Polish pension system. There exists an evident scientific gap, which is covered in the following paragraphs of this study.

4. Data and Methodology

Apart from the selection of the research method, it is also extremely important to choose the right measure of pension fund performance. The use of measures that take into account only the profitability of investments leads to their distortion, because it omits the level of risk borne. Therefore, this study adopted the Sharpe ratio (Sharpe, 1966) and Modigliani risk-adjusted performance (Modigliani & Modigliani, 1997) as they are free of this deficiency. The analyses used daily valuations of accounting units of open pension funds made available by the money.pl. The Sharpe ratio and Modigliani–Modigliani measure were calculated for 82 quarter periods starting from the third quarter of 1999 using the formulas (Bacon, 2013):

$$S_{i,t} = \frac{\overline{r}_{i,t} - \overline{r}_{f,t}}{s_{i,t}} \, , \tag{1}$$

and:

$$M_{i,t}^2 = \frac{\overline{r}_{i,t} - \overline{r}_{f,t}}{s_{i,t}} s_{m,t} + \overline{r}_{f,t} \, , \tag{2}$$

where $S_{i,t}$ – the revised Sharpe ratio of the *i-th* pension fund in period t, $\overline{r}_{i,t}$ – the average daily logarithmic return from the accounting unit of the *i-th* fund in period t, $s_{i,t}$ – the standard deviation of the daily logarithmic excess return from the accounting unit of the *i-th* fund in period t, $\overline{r}_{f,t}$ – the average daily logarithmic return from the risk-free asset in period t, $s_{m,t}$ – the standard deviation of the daily logarithmic excess return from the market in period t, i – the pension fund number ($i = 1, 2, 3, ..., 17$), t – the period number (a quarter; $t = 1, 2, 3, ..., 82$; $t = 1$ corresponds to the third quarter of 1999). The quarters in which the fund started or ended operations were not considered. The WIBID TN rate was adopted as the estimated risk-free interest rate, while the WIG index was chosen as a market proxy (data provided by stooq.com). The obtained Sharpe ratio and M^2 values were then used to examine the performance repeatability of open pension funds using the methods described in the following part of the paragraph.

Provided that $\{X_t : t \in \mathrm{N}\}$, where N – the set of natural numbers, is a stochastic process with a finite state space (for convenience, let us assume that the values, which the process can take, belong to the set $\{x_1, x_2, ..., x_n\}$). We can say that X_t is a Markov chain, if the probability of the process adopting a certain value at time t depends only

on the value that the process assumed at time $t–1$, and not on the values previously adopted. If the probability does not additionally depend on time, then we call such the process a homogeneous Markov process. Then the probability of being at the moment t in the state j provided that it was previously in the state i ($i, j \in \{1,2,3,...,n\}$) is constant, it is marked as $p_{i,j}$. Considering $p_{i,j}$ for all permissible pairs (i, j), one can build a square matrix with n rows showing all transition probabilities for period:

$$Q(1) = \begin{bmatrix} p_{1,1} & p_{1,2} & \cdots & p_{1,n} \\ p_{2,1} & p_{2,2} & \cdots & p_{2,n} \\ \cdots & \cdots & \cdots & \cdots \\ p_{n,1} & p_{n,2} & \cdots & p_{n,n} \end{bmatrix}. \tag{3}$$

The element at the intersection of the i-th row and the i-th column is equal to $p_{i,j}$. If we now denote by $\bar{m}_t = \left[p_1^t, p_2^t, ..., p_n^t \right]$ the vector the probabilities with which the process X_t can take the appropriate values ($\Pi\left(\{\omega \in \Omega : X_t(\omega) = x_k\}\right) = p_k^t$), then $\bar{m}_{t+1} = \bar{m}_t \cdot Q(1)$. Similarly, transition probabilities are considered over s periods and a transition matrix appropriate for s periods is defined as $\bar{m}_{t+s} = \bar{m}_t \cdot Q(s)$ (obviously $Q(s) = [Q(1)]^s$). Moreover, additional information about the process can be obtained by examining the vector $\bar{m}_\infty$ illustrating the probability of being in particular states after an infinite number of transitions ($\bar{m}_\infty = \lim_{t\to\infty} \bar{m}_t$) regardless of the initial state $\bar{m}_0$ (it has been proven that $\bar{m}_\infty$ always exists) (Epstein, Howlett, & Schulze, 2003).

Assuming that the stochastic process reflecting the value of the Sharpe ratio and M^2 in subsequent quarters in relation to the performance of open pension funds is a homogeneous Markov process with a transition matrix identical for all funds, it is possible to estimate individual transition probabilities. To simplify, the number of states can be assumed $n = 2$, while being in state 1 is equivalent to achieving a result below the median, and state 2 in other cases. We then estimate $p_{1,1}$ as the ratio of the number of funds that failed in two consecutive periods to the number of funds that failed in the first period; $p_{1,2}$ as the ratio of the number of funds that failed in the first period and met with success in the second period to the number of funds that failed in the first period, etc. Actually, the transition probabilities should be estimated for each two successive periods separately. However, a small number of operating open pension funds would suggest making calculations in relation to observations accumulated in all periods, which in practice means assuming that the process is close to reaching a stationary status. In the absence of repeatability or reversal, the calculated quotients should be close to $1/2$. The significance of deviations from this value can be tested using χ^2 test. The test statistic is:

$$\chi^2 = \frac{(N_{1,1} - N/4)^2 + (N_{1,2} - N/4)^2 + (N_{2,1} - N/4)^2 + (N_{2,2} - N/4)^2}{N/4}, \tag{4}$$

where N – the total number of observations, $N_{1,1}$ – the number of funds that in two consecutive periods achieved a result below the median, etc. In the absence of a correlation between performance results, this statistic has an asymptotic distribution χ^2 with one degree of freedom. If this hypothesis is rejected then it should be considered that the performance of pension funds is characterised by repeatability or reversal (conclusions regarding the direction of dependence are formulated by analysing the system of transition probabilities) (Jackowicz & Filip, 2009).

The method using the transition matrix, however simple, has a significant disadvantage – it forces discretization of the state space of the process. The decision on the number of states and the method of assigning the observation to a specific state is made arbitrarily, which can significantly affect the performance achieved. Therefore, this study also uses a method based on estimation of the stochastic kernel.

In the previous part of the paragraph, the stochastic process was analysed which had a finite state space. This reasoning can be extended to cases when the state space is an infinite set (e.g. a set of real numbers). Then the use of the concept of transition matrix is impossible. In this situation, the concept of stochastic kernel was introduced. The stochastic kernel is the function of two variables (point and set), which for a given point is a probability distribution relative to a given set and meets certain weak regularity conditions (Feller, 1971). They can be treated as a form of a transition matrix with an infinite number of rows and columns. For the stochastic process $\{X_t : t \in \mathrm{N}\}$ with the set of states, which are the subset of real numbers, the stochastic kernel can be determined by the density function $f(x_{t+1}|x_t)$ of a conditional distribution of a random variable $(X_{t+1}|X_t)$ (Jackowicz & Filip, 2009). If we assume that X_t is a homogeneous Markov process, then the density function $f(x_{t+1}|x_t)$ will be independent of t. Its estimation is based on the use of equation $f(x_{t+1}|x_t) = \dfrac{g(x_t,x_{t+1})}{h(x_t)}$, where $g(x_t,x_{t+1})$ is the density of the two-dimensional random variable (X_t, X_{t+1}), whereas $h(x_t)$ is the random variable density X_t. The estimation of the conditional density function will take the form $\hat{f}(x_{t+1}|x_t) = \dfrac{\hat{g}(x_t,x_{t+1})}{\hat{h}(x_t)}$, where $\hat{g}(x_t,x_{t+1})$ is an estimator of the random variable density function (X_t, X_{t+1}), and $\hat{h}(x_t)$ is an estimator of the random variable density function X_t. The first step is therefore to estimate the function $g(x_t,x_{t+1})$ and $h(x_t)$. Kernel estimators are used to this end. With N observations of a random variable (X_t, X_{t+1}) (i.e. pairs of $(x_{i,t},x_{i,t+1})$, $i = 1, 2, 3, ..., N$) we can specify the estimator of function $g(x_t,x_{t+1})$ as:

$$\hat{g}(x_t,x_{t+1}) = \frac{1}{Nab}\sum_{i=1}^{i=N} K_2\left(\frac{x_t - x_{i,t}}{a}, \frac{x_{t+1} - x_{i,t+1}}{b}\right), \tag{5}$$

and of function $h(x_t)$:

$$\hat{h}(x_t) = \frac{1}{Na}\sum_{i=1}^{i=N} K_1\left(\frac{x_t - x_{i,t}}{a}\right), \tag{6}$$

where $K_2(x,y)$ and $K_1(x)$ are functions that satisfy the conditions $\int_{-\infty}^{+\infty}\int_{-\infty}^{+\infty} K_2(x,y)\,dxdy = 1$ and $\int_{-\infty}^{+\infty} K_1(x)\,dx = 1$, whereas a and b – parameters (so-called bandwidths). In this study, it was assumed that $K_1(x)$ is a density function of de Moivre-Gauss standard distribution and $K_2(x,y)$ (in accordance with the recommendations in the paper by Hyndman et al.) meets the condition $K_2(x,y) = K_1(x)K_1(y)$ (Hyndman, Bashtannyk, & Grunwald, 1996). Parameters a and b were estimated using the formulas (Silverman, 1986):

$$a = \left(\frac{4}{3N}\right)^{\frac{1}{5}} s_{x_t}, \tag{7}$$

$$b = \left(\frac{4}{3N}\right)^{\frac{1}{5}} s_{x_{t+1}}, \tag{8}$$

where s_{x_t} and $s_{x_{t+1}}$ are the standard deviations from the sample calculated for the random variable X_t and X_{t+1}, respectively (Gajek & Kałuszka, 1994). Due to the small number of open pension funds operating on the Polish market, the estimations were made for the observations collected in all periods. As in the case of the transition

probabilities, the estimation of the conditional density function $f\left(x_{t+1}\middle|x_t\right)$ should be carried out for each two successive periods separately. The use of observations from all periods prompted by the amount of data is, in practical terms, synonymous with the assumption that process X_t is strictly stationary. Then the density functions $g(x_t, x_{t+1})$ and $h(x_t)$ do not change over time. The approach adopted in this study was used, inter alia, in the previously mentioned work of Jackowicz and Filip (Jackowicz & Filip, 2009).

Performing the estimation results in obtaining a two-dimensional conditional density function whose full graphical presentation is only possible in three-dimensional space. It is, however, much easier to analyse the orthogonal projection of the examined surface. To do this, one should plot isohypses connecting the points with the same value of the conditional density function. Interpretation of the shape of the stochastic kernel then takes place on a similar principle as examining the terrain with the help of a hypsometric map. In this study, it was assumed that the abscissa reflects the process values from moment t, and on the ordinate from the moment $t+1$. A sample plot is presented below.

The key to assessing the performance repeatability is the location of the stochastic kernel relative to the straight line with the equation $x_{t+1} = x_t$ (inclined at an angle of 45°, marked with a white dashed line in the figure). The position of the kernel along it proves the lack of mobility – funds that have achieved good (bad) performance in the current period will also most likely record good (bad) performance.

Fig. 9. Sample orthogonal projection of stochastic kernel

Source: Own elaboration

Counterclockwise rotation indicates that the differences between funds are widening over time. Clockwise rotation towards straight line $x_{t+1} = 0$ proves the disappearance of differences and the decrease in the impact of the performance of the current period on the performance of future periods. The phenomenon of reversal could be said when the kernel is arranged approximately along a straight line inclined at an angle of 135° (black dashed line in the figure).

5. Results and Discussion

Using the data made available by the money.pl and stooq.com in accordance with the guidelines contained in previous paragraph, Sharpe ratios and Modigliani risk-adjusted performance for individual open pension funds were calculated. The charts show their average value and typical area of variation for each quarter.

**Fig. 10.** Average value and typical area of Sharpe ratio volatility for open pension funds in the period of Q3 1999 – Q4 2019

*Source:* Own elaboration (data provided by stooq.com and money.pl)

Fig. 11. Average value and typical area of Modigliani risk-adjusted performance volatility
for open pension funds in the period of Q3 1999 – Q4 2019

Source: Own elaboration (data provided by stooq.com and money.pl)

The plots presented show a clear trend of the performance of pension funds to be similar over the period considered. In the next step, a two-line transition matrix was estimated, with the discretization using the sample median equal to Me = 0.032 (Sharpe ratio):

$$Q(1) = \begin{bmatrix} 0.527 & 0.473 \\ 0.466 & 0.534 \end{bmatrix}$$

or Me = 0.05% (Modigliani-Modigliani measure):

$$Q(1) = \begin{bmatrix} 0.530 & 0.470 \\ 0.465 & 0.535 \end{bmatrix}.$$

Then, by making 2^{100} iterations, an approximation of the invariant vector was obtained in case of Sharpe ratio:

$$\bar{m}_\infty \approx \begin{bmatrix} 0.496 & 0.504 \end{bmatrix}$$

and Modigliani-Modigliani measure:

$$\bar{m}_\infty \approx \begin{bmatrix} 0.497 & 0.503 \end{bmatrix}.$$

In addition, the χ^2 test statistics were calculated. The p-value for Sharpe ratio is 0.036 while for the M^2 0.026. The obtained results indicate the statistically significant, though rather weak repeatability (resulting from the analysis of estimated transition probabilities). In the long run, the initial choice of the fund does not seem to affect the amount of the pension – only systematic monitoring of performance achieved and a change of fund (if it achieved an unsatisfactory rate of return) could increase the amount of the future benefit.

To obtain confirmation of the above results, an analysis using a stochastic kernel was also carried out. Based on the estimated unconditional densities, the conditional density function $f\left(x_{t+1}\middle|x_t\right)$ was calculated and is shown on the graphs. To simplify the analysis, charts of an orthogonal projection of a stochastic kernel on a plane were also plotted. The projected shapes of the kernel allow us to confirm the previously formulated conclusions.

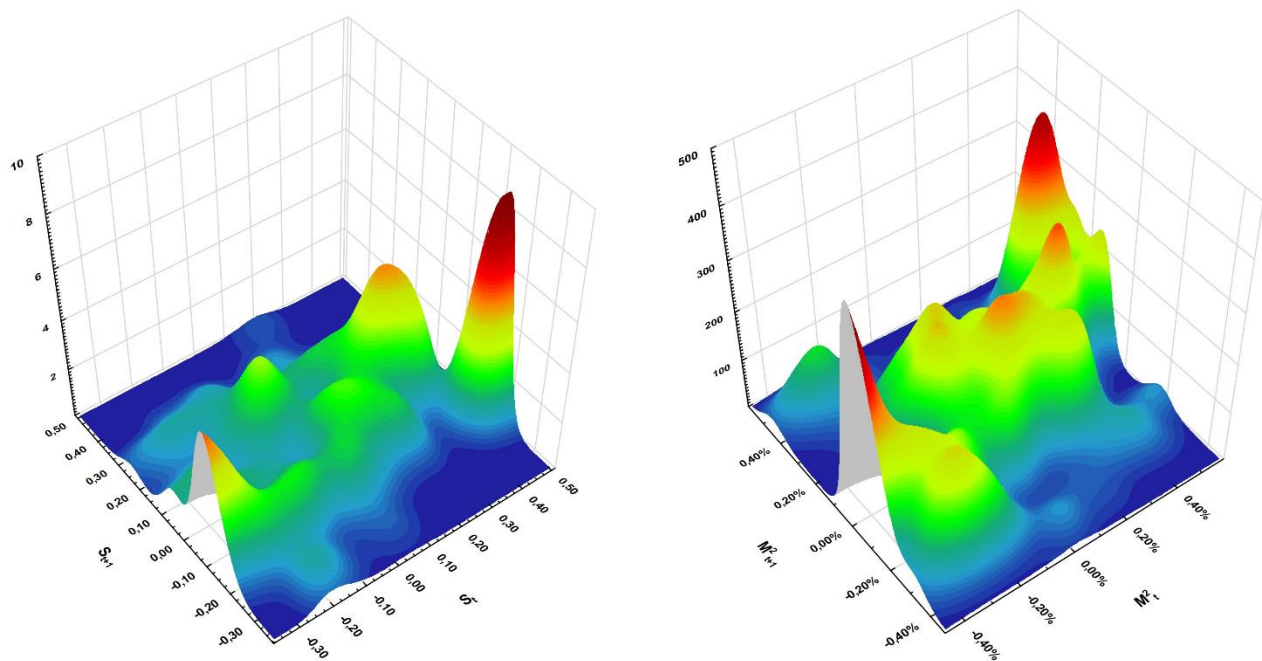

Fig. 12. Estimated conditional density function for Sharpe ratio (left graph) and M^2 (right graph)

*Source:* Own elaboration (data provided by stooq.com and money.pl)

Fig. 13. Orthogonal projection of the estimated stochastic kernel for Sharpe ratio (left graph) and M^2 (right graph)

Source: Own elaboration (data provided by stooq.com and money.pl)

They indicate some performance repeatability, in particular for the central values. On the other hand, the trend of performance convergence of open pension funds is much more marked for the extreme values, especially in case of Sharpe ratio.

The results presented for quarterly data remain valid while analysing Sharpe ratio and Modigliani-Modigliani measure for yearly periods. The transition matrices are almost the same and only minor differences might be observed in case of shape of stochastic kernel.

The results obtained using theory of Markov chains and estimated stochastic kernel are consistent with the conclusions formulated by (Bukietyńska, 2017) using test of inversion of Sharpe ratio for open pension funds. Moreover, the author's observations cover 20-year period while (Bukietyńska, 2017) only 9-year period. The presented results remain in agreement with assumption of future pensioner's rationality and empirical evidence provided by (Jędrzychowska, 2011). Thus, we may conclude, that the initial choice and potential changes of open pension fund in the future are not important for future pensioner's wealth. As a consequence, we may treat the set of open pension funds as unity or at least a very homogenous one.

Conclusions

The calculations made allowed us to draw the conclusion about the phenomenon of very weak, though statistically significant, performance repeatability achieved by open pension funds operating on the Polish market. The analysis of empirical data also confirms previous local and international results (Bohl, Lischewski, & Voronkova, 2011; Draženović, Hodžić, & Maradin, 2019; Kurach, 2019) indicating that the rates of return recorded by individual entities become increasingly similar over time. The study highlighted the clear advantages of the methods adopted to study distribution dynamics – above all, the ease of interpretation of the results obtained. These methods are a valuable tool in the process of analysing various economic phenomena.

Abstract. This research aims to characterize the intellectual capital in Ecuadorian companies and to validate the applicability of a scale suitable for this context, considering each of its dimensions (human capital, structural capital, and relational capital), as well as innovation aspects of the Ecuadorian companies. The study uses a mixed approach, including factorial analysis and descriptive statistics, using a sample of 88 companies from different economic sectors, located in a single province of Ecuador. The results verified the applicability of the scale and its usefulness for future studies; and they showed that there are different kinds of configurations of intellectual capital, based on the sector and type of innovation usually implemented by companies. In order to be more innovative, construction firms in Ecuador need to focus more on the structural and relational dimensions of intellectual capital, and accommodation and food services industries should orient their efforts toward further developing their human capital. Future studies may explore the opportunities for enhancing innovation performance based on the management of intellectual capital in more detail, using larger sample sizes.

Keywords: intellectual capital; human capital; relational capital; structural capital; Latin America

1. Introduction

Today, knowledge-based organizations are an important part of modern societies (Berezinets, et al. 2016), as companies compete by relying more on their intangible resources as key value factors (Sharabati, Jawad & Bontis, 2010). These intangible resources, which produce important benefits to overcome the weaknesses of small and medium enterprises (Verbano & Crema, 2016; Jordão & Novas, 2017) can be technologies, employee skills, process innovations, organizational structure, creativity, industrial networks, or relationships with customers and external suppliers (Starovic & Marr, 2004; Keong Choong, 2008).

Given the characteristics of the market, being technological developments, changes in social conditions, and reduction of the products' life cycles, what will make companies more competitive in the current economic scenario will be the effective management of knowledge assets, including intellectual capital (Zhang & Lv, 2015; Agostini, et al. 2017).

Intellectual capital (IC) is recognized as one of the most important assets for business results and the basis for market leadership and differentiation, because it provides unique resources that cannot be easily imitated by competitors, and ultimately, it helps to deliver competitive advantage and value for organizations (Lev, 2001; Curado, 2008; Roos, 2017).

Considering the importance of intangible assets for companies, researchers have formulated some methodological frameworks and empirical studies in order to measure and evaluate each one of the components of IC and its economic impact (Goebel, 2015). However, much of this research has focused on assessing and analyzing IC in developed countries, or in knowledge-intensive industries such as technology, pharmaceuticals, banking, and telecommunications.

In emerging countries, empirical studies on innovation—and in the particular case of the role of IC for innovation—are still scarce, and often limited to specific regions and sectors (Jardon & Martos, 2012), or regional leaders with a large GDP like Brazil (Davila et al., 2019). In response, the present research aims to characterize IC and innovation and to validate the applicability of an instrument in more traditional and less explored industries, located in an emerging country like Ecuador. These sectors are manufacturing, commerce, information and communication technologies, construction, professional activities, housing, and food services.

The research will try to answer the following questions: How is IC and innovation managed in Ecuadorian companies? How can IC be quantified in emerging countries? How can Ecuadorian companies be characterized in relationship to their IC and the type of innovations they make?

Ecuador was chosen for two reasons. Firstly, Ecuador is one of the most economically stable countries with one of the highest GDP per capita in Latin America. According to the World Bank (2019), Ecuador has the 62nd highest GDP in the world, and it has a human development index of 0.762, above average for Latin American countries. Secondly, Ecuador has specific characteristics and at the same time, it has a lack of academic studies when compared with other emerging countries like Mexico or Brazil. Most Ecuadorian firms are SMEs (Superintendencia de Compañías, Valores y Seguros, 2018). Regarding innovation, Ecuador is ranked 99 worldwide according to the Global Innovation Index (GII, 2019), and this shows a need for the development of innovation capabilities. Private firms make huge investments in formal training for workers and this represents a strength that when combined with quality management and knowledge management, may enhance innovation capabilities. Consequently, Ecuador has good potential for academic analysis that will allow conclusions to be drawn, which will serve as inputs for new studies in the region.

This document is structured as follows: in Section 2, a theoretical review related to IC and innovation is provided. Section 3 describes the methodology, extensively developed in the study. Later, in Section 4, the results found in the research and their respective discussion are presented. Finally, Section 5 shows the conclusions.

2. Literature review

2.1 Innovation in emerging countries

In the current context, characterized by globalization and dynamism resulting from technological disruptions and political and economic turbulence, innovation becomes an intrinsic characteristic for companies wishing to survive in the market (Teece, 2010). Innovation is defined by Schumpeter (1927) as the superior condition achieved due to the improvement or development of a new product or production method, or due to the opening of a new market. The interest of managers and academics in innovation is to try to understand how the innovation phenomenon has been growing in recent decades (Baregheh et al. 2009). Baregheh et al. (2009) state that innovation is being analyzed from different disciplines such as management, economics, technology, and engineering. In management, specifically in studies related to knowledge management, innovation has been conceptualized as a product of factors; one of which is the IC of organizations (Edvinsson, Sullivan, 1996; Sullivan, 1998; Bontis & Fitz-Enz, 2002; Subramaniam & Youndt, 2005).

Despite the growing interest in the subject, the number of studies has evolved very unevenly when developed and emerging countries are compared. In developed countries, there are empirical studies that have characterized IC, have developed measurement techniques for that variable, and have analyzed the relationship between IC and innovation (Bontis, 2001; Cabrita & Bontis, 2008; Marques et al. 2006; Maurer et al. 2011; Cabello-Medina et al. 2011; Dumay & Garanina, 2013; Kianto et al. 2017). Looking at studies on IC and innovation in emerging countries, it is evident that those are scarce and limited in scope to some sectors and regions, and therefore there are greater gaps in knowledge (Jardon & Martos, 2012). This lack of studies about the influence of IC on the innovative performance of companies in emerging countries is critical. This is due to the pressure on companies to innovate in a context where customer's demands are often more complex, and companies frequently face global competitors with better institutional support, access to technology, qualified personnel, and other resources (Dávila et al. 2019).

In the following section, IC and its dimensions will be discussed, as well as the theoretical relationship between IC and innovation. Subsequently, this construction will be characterized in the Ecuadorian context, and based on the results, proposals will be developed that will serve for future empirical studies on the relationship between IC and innovative performance.

2.2 Intellectual capital

The academic literature has provided several definitions related to IC. One of the most influential was established by the authors Stewart & Losee (1994) who considered IC as "the knowledge a company has in order to create a competitive advantage". It also constitutes the knowledge that is generated within the organization and that can be converted into tangible benefits (Edvinsson & Sullivan, 1996; Sullivan, 2000).

For Lev (2001), IC is also an intangible source of value, transmitted by innovations in specific projects or human resource management practices of an organization. Marr, Schiuma, & Neely (2004) further consider that IC is represented by the combination of resources and intangible activities that allows an organization to obtain a competitive advantage through the transformation of material, and financial and human resources into a system capable of creating stakeholder value and organizational innovation.

Jordão & Novas (2017) consider that IC is composed of the relationship between the material and immaterial resources in the possession of an organization. The same interpretation is made by Kujansivu & Lönnqvist (2007),

who mention that IC is made up of all the intangible and non-physical goods that are important in a knowledge-intensive industry.

For Stewart (1997) and Bontis (2001), IC is intellectual material, represented in knowledge, experience, intellectual property, and information that can be used to create wealth; however, Dumay (2016) makes a clarification to this definition considering that it does not take into account the totality of the nature of IC to create wealth, affirming furthermore that the basis of the value creation process (monetary, social, and sustainable) is key to deduct the value and characterization of the IC. Dženopoljac, et al. (2016) further consider that the potential of IC in corporate performance will be evident in terms of the management of this intangible resource.

Current researchers of IC such as Bontis et al. (2015), Dumay & Garanina (2013), and Kianto, et al. (2010) recognize this intangible asset as a term under construction and with multiple facets, since IC constitutes a multidimensional concept of knowledge assets, experience, and practical capabilities to create value of products and services Dumay (2016), using the intelligence rather than just the financial aspect (Allameh, 2018).

At the same time, it is important to highlight that due to the lack of direction related to the classification of intangible assets, there are several arguments related to this issue which have resulted in IC being categorized between two to four dimensions (Dženopoljac et al., 2016). However, to address this weakness, Bontis (1998); Roos, et al. (1997); Sullivan (2000); Roos (2017), Matricano (2016), Wee & Chua (2016); and Buenechea-Elberdin (2017) identified three main components to categorize IC: human capital, structural capital, and relational capital.

Human capital constitutes the combined knowledge, skill, and innovation capacity that employees have in order to accomplish a task (Edvinsson & Malone, 1997). It also contains a series of characteristics such as education, knowledge, cultural value, and corporate identity that can influence creativity and the willingness to create new ideas within the company (McGregor, et al. 2004; Martín-de-Castro, et al. 2011). This gives satisfaction to the employee and the improvement of personal and organizational performance (Martínez-Torres, 2006).

Sayyed (2018) determines that human capital is one of the largest and most important dimensions of IC in an organization. Bontis (1998) also points out that human capital constitutes a source of innovation and a strategic element for an organization. FitzPatrick, et al. (2013) agrees with this argument, and, further considers that human capital is one of the key resources of strategic renewal and therefore cannot be replaced by machines; since human capital is "the intelligence of the member of the organization" (Bontis, 1998, 65).

Structural capital constitutes the knowledge incorporated in the structures and processes of the organization, and it includes databases, patents, trademarks, research and development, technology, information systems, strategies, organizational charts, manuals and programs, and all the capabilities of the organization that support employee productivity (Edvinsson & Malone 1997; Bontis, 2001; Petty & Cuganesan, 2005 and Nazari & Herremans, 2007). Casas Nova, et al. (2017) also pointed out that the procedures, rules, systems, and routines are elements that together define the organizational system (structure and processes). Through structural capital, the company can turn the innovation and energy of its human resources into the property of the organization (Seleim, et al. 2004; Casas Novas et al. 2017). Furthermore, it is considered internal capital since the accumulated knowledge within the company's structures, processes, and capacities remain in the company when the employee goes home (FitzPatrick, et al., 2013).

Relational capital constitutes a network of relations between people and groups of people, through which information and knowledge is transferred in a shared way (Roberts, 2003). Relational capital symbolizes the best

attitude of an organization to incorporate the knowledge that comes from the interaction with the external community, such as suppliers, customers, government, and industry and that it develops throughout its existence (Bontis, 1998; Inkinen, 2015). It is embedded in marketing channels, brand names, reputation, customer satisfaction, franchisees, suppliers, and partners (Bontis, et al. 2000; Davey et al. 2009). Casas Novas et al. (2017) also emphasizes that this capital is not owned by the organization, but it can establish corrective measures with a view to its development and determine connectivity between the elements (internal and external) essential for its formation.

Despite fundamental differences in each of the components of IC, they are not always found separately in organizations. Individual knowledge, for example, is related to human capital, and is often codified and institutionalized through structural capital, which is transferred and used in social networks by social capital. Therefore, the different dimensions of IC influence organizational outcomes, including innovation (Machado et al. 2017).

2.3 Intellectual capital and innovation

Innovation is defined as the openness and willingness to create and test new ideas given by a cultural aspect of the company to seek new ways of doing things, being creative in their methods of operation and product introduction (Schumpeter, 1927; Calantone et al. 2002). Several empirical studies (Fernández, et al. 2000; Subramaniam & Youndt; 2005) concluded that intangible factors have a significant influence on innovation outcomes. For that reason, organizations have realized that they can achieve sustainable innovation through IC and that their success depends largely on their ability to manage this valuable intangible asset (Tootifar, et al. 2014; Buenechea-Elberdin, 2017), since knowledge assets, including IC, are essential to maintaining an appropriate innovation environment and developing sustainable innovative capabilities in a competitive environment (Allameh, 2018). Therefore, IC is seen as an antecedent for innovation (Chahal & Bakshi, 2015).

Some empirical studies have explored the role of IC and its dimensions (relational, structural, and human capital) for enhancing innovation performance. Most studies suggest that relational capital has a positive influence on innovation performance (Capello & Faggian, 2005; Zerenler, et al. 2008; Dorrego, et al. 2013; of Cabrilo & Dahms, 2018). The study by Dorrego et al. (2013) using data from SMEs from different industries shows that relational capital is an antecedent of product innovations. More evidence about the positive influence of relational capital on innovation performance was shown in the study by Zerenler, et al. (2008) in a Turkish automotive parts firm, and in studies using data from medium and large-sized manufacturing and service firms from Serbia (Cabrilo & Dahms, 2018) and Italy (Capello & Faggian, 2005). In addition, Capello & Faggian (2005) evidenced that in firms from high technology sectors, the contributions of relational capital to innovation are higher. In SMEs, the situation is not different: using data from high tech Italian manufacturing firms, the study of Agostini, et al. (2017) shows that firms with more relational capital tend to have better firm outcomes.

Regarding structural capital, its importance for leveraging innovation performance was highlighted by several studies around the world (Cabrilo & Dahms, 2018). Using data from Turkish manufacturing firms, Bayraktaroglu, et. al (2019) demonstrated that structural capital is positively related to innovation performance. Similar results were obtained by Agostini & Nosella (2017) using data from Italian manufacturing SMEs. The study of Buenechea-Elberdin, et al. (2018) classified 180 medium and large-sized firms into two groups: high tech and low tech firms. Their results evidenced that in high tech firms, structural capital influences innovation performance, with capital renewal as a moderating factor. In low tech firms, Buenechea-Elberdin, et al. (2018) show that structural capital has a direct and positive effect on innovation performance.

Human capital is highlighted by academics as a critical dimension of IC. Some studies show a direct relationship between human capital and innovation performance (Bayraktaroglu, et al. 2019), and some others posit that this relationship is moderated for organizational capabilities, for instance absorptive capacity (Engelman et al., 2017). The study by Engelman et al. (2019) uses data from Brazilian manufacturing firms and highlights the positive influence of human capital on absorptive capacity, and of absorptive capacity on innovation performance. Similar results were obtained in the study by Xu & Li (2019), which analyzes high tech and low tech manufacturing SMEs from China, and provides evidence that the impact of human capital in high-tech SMEs is greater than that in non-high-tech SMEs. Despite few studies (Cabrilo & Dahms, 2018) providing evidence of a significant influence of human capital on innovation performance, there seems to be a consensus in academia about the significance of this relationship.

3. Methodology

For this paper's purpose, a mixed approach was used. First, a survey was applied in order to collect information about levels of IC and innovation in firms from Loja, Ecuador. In the second step, the scale used for measuring IC was statistically assessed. In the final step, the study presents a descriptive analysis for explaining relevant aspects related to the dimensions of IC and innovation.

3.1 Sample

The selected sample was of 88 companies from the city of Loja, from the main economic sectors of the Province of Loja—according to the results of the National Economic Census (INEC, 2011)—such as manufacturing, commerce, information and communication, construction, professional activities, lodging, and food services, as described in Table 1. Companies with active status, and registered with the "Superintendencia de Compañias Valores y Seguros of Ecuador" were considered as the basis for the study. The obtained sample represents 21% of the total of 424 companies from these sectors in Loja Province. The information was collected through face-to-face surveys with managers of tactical or strategic levels of the target companies, between March and August 2018.

Table 1. Distribution of companies in this study.

Economic Section	Amount	Percentage
Information and communication	17	13.79%
Manufacturing	27	31.03%
Trade	2	2.30%
Construction	20	22.99%
Professional activities	10	11.49%
Accommodation and services	11	12.64%
Total	**87**	**100%**

Source: Results of the study

The survey contained 40 questions distributed in five blocks. The first block collected general information of the population (to know, among other things, the sector, size, whether the company is family owned or not, and the percentage of women in it); in the second block, data related to human capital was collected; the third block contained questions focused on structural capital; the fourth block was to collect information related with

relational capital; and finally, in the fifth block, data related to innovation was collected. The first and fifth blocks of the survey were developed on the basis of open and closed questions; while, from the second to the fourth block, the design was elaborated with a Likert scale, using a scale of 5 options: (1) strongly disagree, (2) disagree, (3) neither agree nor disagree, (4) agree, and (5) strongly agree.

The scale for IC was developed based on several relevant studies from around the world. The human capital dimension was measured using 11 items based on Ganesan et al. (1996), Babin & Boles (1996), Bontis (2013), Edvinsson & Malone (1997), Sharabati et al. (2010), Hartline & Ferrell (1996), Youndt et al. (2004), and Carmeli, 2004 among others. For measuring the structural capital dimension, 10 items from IRSE (2007), Berry (1991), Ulrich et al. (1999), Song and Parry (1993), Tippins & Sohi (2003), and Youndt et al. (2004) among others were used. Finally, for measuring relational capital, eight items based on Chen et al. (2004), Gallego & Rodríguez (2005), Warn (2005), Youndt et al. (2004), Bontis (1998), Peña (2002), Bueno et al. (2004), and Yli-Renko et al. (2001) among others were used. The authors that support each item of the IC scale are detailed in the appendix.
The instrument was selected as it was considered appropriate for the Ecuadorian context, after conceptual and applicability validations with two academic specialists from the authors' institution, and two external academics. According to Creswell, & Creswell (2017), some questions were added and others were modified to guarantee applicability to the Ecuadorian context. Finally, the new IC instrument was validated by a group of five Ecuadorian entrepreneurs to ensure its functionality before data collection. This instrument is shown in Table 2. Finally, based on Calantone, Cavusgil, & Zhao (2002); and Weerawardena (2003), each company was consulted about its predominant type of innovation: product or process.

3.2 Analysis Method

In line with the objective of the present work, which was to characterize the IC and innovation in the companies of Loja, this work had two parts. First, statistical validations of the reliability and validity of the used scale were made to verify if it was applicable and could correctly represent the variables of IC in the Ecuadorian context. Next, the collected data went through a descriptive analysis, following suggestions from Creswell, & Creswell, (2017). The results were presented and discussed with Ecuadorian and international specialists regarding IC and innovation.

4. Results analysis and discussion

After data collection, the suitability of the instrument to measure the components of IC and innovation in the Ecuadorian context was verified (Chart 2). The reliability of each category was confirmed by verifying values greater than 0.6 for indicator loadings (Hair et. al 2010) and values higher than 0.7 (threshold suggested by Nunnally & Bernstein, 1994) for each construct, following the tests of Dijkstra-Henseler, Jöreskog, and Cronbach's alpha. Convergent validity was confirmed by verifying that the average variance extracted from each construct (AVE) was above 0.5, following the suggestions of Fornell & Larcker (1981). Then, divergent validity was confirmed by verifying that the cross-loadings and the HTMT coefficient (Heterotrait-Monotrait Ratio) were lower than 0.9 for each category, as suggested by Fornell & Larcker (1981). Finally, it was verified that all the indicators or questions had a VIF (variance inflation factor) index lower than 3.3 to guarantee the absence of multicollinearity. After the first assessment of the above-mentioned indicators (first iteration), indicator H1 (VIF > 3.3) was eliminated to avoid multicollinearity; indicators H11, E10, and R5 (loadings less than 0.6) to guarantee reliability; and indicators H8, H9, E3, E4, R3, and R4 (for cross loadings) to guarantee discriminant validity (see details in the Appendix). The second interaction yielded values showing correct reliability and validity, as can be seen in Table 2.

Table 2. Instrument to measure IC in companies in Ecuador.

INDICATORS	Loadings	Dijkstra-Henseler's rho (ρA)	Jöreskog's rho (ρc)	Cronbach's alpha(α)	AVE
HUMAN CAPITAL (HC)		0.898	0.918	0.896	0.617
H1. Employee commitment					
H2. Tasks within deadlines	0.833				
H3. Recognition of efforts and improvements	0.757				
H4. Positive attitude to change	0.792				
H5. Continuing education	0.745				
H6. Degree of initiative for improvement	0.816				
H7. Satisfaction towards subordinates	0.778				
H8. Adaptation to changes					
H9. Competition for the position					
H10. Development of creativity	0.771				
H11. Staff rotation					
STRUCTURAL CAPITAL (SC)		0.896	0.903	0.879	0.539
E1. Periodic review of the strategic plan	0.708				
E2. Coordination of departments	0.807				
E3. Knowledge of activities at all levels					
E4. Incentive to create something new					
E5. Working environment	0.725				
E6. Description of procedures	0.774				
E7. Database	0.774				
E8. Information storage and processing	0.737				
E9. Computer systems	0.614				
E10. Use of patents and/or licenses					
RELATIONAL CAPITAL (RC)		0.866	0.887	0.847	0.569
R1. Customer retainment	0.763				
R2. Relationship with customers	0.815				
R3. Relationship with suppliers					
R4. Assessment of competitors					
R5. Cooperation agreements with the sector					
R6. Relationship with universities, institutes, or innovation centers	0.704				
R7. Knowledge of community needs	0.739				
R8. Socially responsible company	0.853				

Source: Results of the study.

After ensuring that the scale adequately measured IC and its dimensions, the existence of a high correlation between them can be observed, according to the numbers shown in Table 3. This result is similar to previous studies (Bozbura, 2004) and may show that companies develop their IC as a result of generic actions aimed

toward improving their competencies, rather than as a result of a strategy focused on a certain dimension or set of dimensions of IC.

Table 3 - Correlation between the dimensions of IC in companies in Loja

		1	2	3
1	**Human capital**	1		
2	**Structural capital**	0.6271	1	
3	**Relational capital**	0.7209	0.7355	1

Source: Results of the study.

After verifying the scale, IC characteristics and innovation of the studied companies were analyzed using descriptive analysis.

Fig 1. Average IC by type of business
Source: Results of the study

Figure 1 identifies, on average, greater efficiency of the three components of IC (human, structural, and relational) in companies where family ties are not predominant. These results are due to the fact that in family businesses there are greater restrictions or a tendency to increase the dispersion of ownership and even more of their intangible assets. At the same time, a lower average (3.92) was observed in family businesses for relational capital, as most family businesses avoid maintaining entries of external people for fear that they may take control of the organization (Goyzueta, 2013). However, Rodríguez-Suárez, et al. (2013) emphasize the external relations that family businesses must maintain, because of their decision-making processes and, above all, because they are dynamic companies.
Fig 2. Average of IC components according to % of women in each company.
Source: Results of the study.

In Figure 2, the contribution of the female gender in determining intellectual capital is shown, denoting that when there is greater involvement of women (between 75% and 100% and between 25% and 50%), the structure of IC in each of its components (human, structural, and relational) has a greater contribution to the results of the organization. It is considered that women have the ability to create a favorable environment for companies (Granelli & Robotti, 2016). On the other hand, studies such as that of López (2013) consider that in organizations there should be an equal presence of men and women, constituting a source of creativity and inclusion for entities. Other research supports this statement by ensuring that to assess the IC and management of organizations, the distinction between men and women does not matter because the most relevant factors are the competencies of workers and not their gender (Trequattrini, et al, 2018).

FFig 3. Average IC by economic sector
Source: Results of the study.

Figure 3 shows the distribution of the components of IC by each economic sector of study. It can be seen that in the service sectors, especially knowledge-intensive ones—those related to professional, scientific, and technical activities—there is greater efficiency of human capital. For instance, previous studies in Tunisian ICT firms showed that incremental innovations are positively linked to human capital (Berraies, 2019). Other studies highlighted the importance of human capital and relational capital for innovation in knowledge-intensive firms (Capiello et al., 2020). Regarding accommodation and food services, results from the present study evidenced that these firms needs to focus on the development of human capital (the IC dimension with the lowest mean), in line with previous studies that highlighted the relevance of human capital with information technology (Rudež & Mihalič, 2007) and structural capital (Kim et al., 2012).

In manufacturing companies, there is a greater predominance of structural capital. Surprisingly, the present study showed a predominance of human capital in firms from the construction sector. Even though Lin et al. (2018) posit that business performance in the construction industry relies highly on IC, a recent study by Duodu & Rowlinson (2019) with firms from the construction sector in Hong Kong evidenced that both the structural and relational dimensions have a positive influence on innovation performance, while the effect of human capital on innovation is through the other dimensions. It may be proposed that firms from the construction sector in Loja may be able to increase their innovation performance if they focus on improving their structural and relational capital.

In this regard, it is important to note that Machado, et al. (2017) highlighted the differences in the IC configurations that companies of various types have, and in turn, stated that there is always a synergy between the components of the IC, which act together to achieve competitiveness.

Fig 4. Predominant type of innovation by economic sector
Source: Results of the study.

Due to the characteristics of the sample and the context of the study, there is more product innovation (in goods and services) in the economic sectors analyzed represented in Chart 4. Recent research has shown that companies in Latin America tend to develop incremental product innovations, as they are constantly looking for foreign product designs and adapting them to local environments (Davila, et al. 2018). In line with Hipp & Grupp (2005), in non-knowledge-intensive services (e.g. ICT, construction, housing, and food services) where cost and time

efficiency are important, the present study found that innovation has been carried out on products. Studies by Kianto et, al. (2010), Schilling (2011), and Buenechea-Elberdin (2017) also state that the intensity with which the IC influences innovative performance will also depend on the location of the company, the industry to which it belongs, its level of technology, and its size.

Fig 5. IC dimension averages by type of innovation
Source: Results of the study.

Figure 5 shows that companies which innovate in processes have different IC structures to companies that innovate in goods or services. The first ones have a greater focus on their human capital, because the knowledge, experience, skills, and creativity of the employees are fundamental for the creation of new processes (Mariz Perez et al. 2012). Companies that innovate in products also develop a higher structural capital, as this type of innovation is more complex (mainly in emerging countries), because it requires an adequate integration of specialized knowledge in people, towards final goods and services, supported by organizational processes and technology (Davila, et al. 2018). The support of organizational processes and technology in the launching of products contributes to the reduction of production costs, the faster completion of development projects, to the creation of spaces for innovation, to improving decision-making and results coordination, and to increasing the sales or revenue from new products and services (Huang, et al. 2010; Chen, et al.,2017).

At the same time, the present study showed that all companies, regardless of the type of innovation they present, pay attention to relational capital as external knowledge is a critical input for the innovative performance of organizations (Fosfuri & Tribó, 2008). On this point, Subramaniam & Youndt (2005) state that organizations generate innovations when their individual experts communicate, network, and share knowledge with each other. Dost, et al. (2016) concluded that IC is significantly associated with innovation, whether in products or processes, which is consistent with the results of the present research.

5. Conclusions

The main academic contribution of this study was the adaptation and verification of a scale to analyze IC in emerging countries. This scale can be used in future research, which seeks to identify relationships between IC and organizational outcomes, such as innovation and financial performance, in companies located in Ecuador or other emerging countries.

In addition, the main empirical contribution of this study is the description of the components of IC in Ecuadorian companies. The results show that the configurations of IC may vary in companies according to their sector and the type of innovation usually practiced by each company. This study identified some opportunities related to IC, for improving their innovation performance in firms from Loja. Accommodation and food services may focus on the development of human capital, and construction firms may improve their innovativeness if they increase their efforts to enhance both structural and relational capital. A dynamic view of IC covers the integration of all its components, which means considering the effects and relationships with each other, in order to understand in a broad and organized way the strengths of each organization, and to promote successful innovation.

IC appears to be an important potential engine of innovation for Ecuadorian companies, especially those located in the city of Loja. However, a proposition of this study is that not all companies need a high level of development of all IC dimensions. The level of development required for each dimension depends on its own characteristics, such as economic sector, size, or location. However, it is important to emphasize that all IC dimensions should work together to ensure that the IC contributes to creating value (Casas Novas et al. 2017). Further studies may help to explain which levels of IC and its dimensions are needed in order to achieve superior innovation performance, taking into consideration their sector and size. This will allow the development of guidelines for decision makers improving the efficiency in the allocation of its resources, by prioritizing the dimensions of IC that are most relevant to each organization.

Abstract. This paper extends the stochastic mean-semivariance model to a fuzzy multiobjective model, where apart from return and risk, also liquidity is considered to measure the performance of a portfolio. Uncertainty of future return and liquidity of each asset are modeled using L-R type fuzzy numbers that belong to the power reference function family. The decision process of this novel approach takes into account not only the multidimensional nature of the portfolio selection problem but also realistic constraints by investors. Particularly, it optimizes the expected return, the semivariance and the expected liquidity of a given portfolio, considering cardinality constraint and upper and lower bound constraints. The constrained portfolio optimization problem resulting is solved using the algorithm NSGA-II. As a novelty, in order to select the optimal portfolio, this study defines the credibilistic Sortino ratio as the ratio between the credibilistic risk premium and the credibilistic semivariance. An empirical study is included to show the effectiveness and efficiency of the model in practical applications using a data set of assets from the Latin American Integrated Market.

1. Introduction

Multi-criteria decision making includes a group of operational research methods that pursue decision making in the presence of multiple criteria, goals, or objectives. This type of method differs from traditional single-objective operational research methods and is intended to support decision makers in the simultaneous optimization of several objectives that usually conflict with each other (Čižo et al., 2020) and those related to financial investments are not an exception (Aznar & Guijarro, 2016; García et al., 2013, 2018; García, González-Bueno,

Oliver, & Riley, 2019; Masood et al., 2019). A characteristic example of multi-criteria decision making is the portfolio selection problem.

Portfolio selection is concerned with the allocation of investor's wealth amongst different types of financial securities. The main goal is to minimize the risk of terminal wealth while the expected terminal wealth equals a prescribed level. The first breakthrough work on this topic was the seminal mean-variance model by Markowitz, (1952). In this classical work, Markowitz used the mathematical expectation of the portfolio's return and its variance as the return and the risk measures, respectively. However, when portfolio returns are typically asymmetric, the variance becomes a less appropriate risk measure, because it considers high returns that investors want as equally undesirable as low returns that investors dislike (Li & Qin, 2014). In other words, both risk measures penalize extreme upside (gains) and downside (losses) deviations from the expected return (Gupta, Mittal, et al., 2013). In order to solve this problem, several downside risk measures (i.e. measures that only consider the negative deviations from a reference return level) have been proposed: semivariance (Markowitz, 1959), lower partial moment (Bawa, 1975; Fishburn, 1977), semi-absolute deviation (Speranza, 1993), value at risk (VaR) (J.P.Morgan, 1996), and conditional value at risk (CVaR) (Rockafellar & Uryasev, 2000, 2002). Semivariance is one of the most commonly accepted downside risk measures. Its main advantage over variance is that it does not consider values beyond the critical value (i.e. gains) as risk (Gupta, Mittal, et al., 2013). Furthermore, it is a more appropriate risk measure when an investor is concerned about underperformance rather than over performance of the portfolio (Markowitz et al., 1993).

The traditional portfolio optimization model focuses only on the risk-return trade-off (García et al., 2015; Markowitz, 1952; Speranza, 1993). However, it is important to consider other criteria which might generate equal or greater satisfaction level for investors. By considering other criteria in the portfolio selection model, it may be possible to obtain portfolios in which a less favorable return or risk is compensated by portfolio's performance as measured by other criteria (Gupta, Inuiguchi, et al., 2013).

Other than return and risk, liquidity is also one of the main concerns for investors when making decisions. Liquidity has been considered as a fuzzy variable on portfolio decision-making in previous studies (Arenas-Parra et al., 2001; Gupta et al., 2008, 2010, 2011; Jalota et al., 2017a, 2017b). Generally, investors' preference is to own portfolios that contain liquid assets which can be easily liquidated in the future. Therefore, it is reasonable to include liquidity as an additional criterion in the mean-semivariance base model, in order to make this model more realistic and usable in a real situation.

In most of the above-referred studies, asset returns were assumed to be a random variable, and portfolio selection models were developed under the assumption that future asset performance may be correctly captured by past asset performance. However, stock markets are complex and randomness is not the only type of uncertainty actually (Huang, 2010). Moreover, stock markets are affected by vagueness and ambiguity associated to linguistic expressions such as "high risk", "low profit" and "low liquidity" used by investors and investment experts (Gupta, Inuiguchi, et al., 2013; Gupta, Mittal, et al., 2013). Owing to vague and ambiguous information, the fuzzy set theory (Zadeh, 1965) has been used for capturing and modeling the information about investor's subjective preferences in portfolio investment. Assuming that returns are fuzzy, a vast literature is available applying possibility measures on the portfolio selection problem (Carlsson et al., 2002; Vercher et al., 2007; Vercher & Bermúdez, 2012; Wang & Zhu, 2002). Although possibility measures are widely used, they are not self-dual (Huang, 2008, 2009, 2010). As an alternative, Liu and Liu (B. Liu & Liu, 2002) proposed a self-dual credibility measure to overcome the limitations of the possibility measure. Since then, some researchers suggest modeling

assets return using credibility measures (García, González-Bueno, Oliver, & Tamošiūnienė, 2019; Huang, 2006a, 2010, 2006b; Jalota et al., 2017a; Mehlawat, 2016; Vercher & Bermúdez, 2015).

An important aspect to consider in fuzzy portfolio optimization is the shape of the membership functions that will best fit the historical asset performance data. Portfolio selection models based on fitting of L-R fuzzy numbers (González-Bueno, 2019; Jalota et al., 2017a; Saborido et al., 2016; Vercher & Bermúdez, 2013, 2015) model the uncertainty of the return on a given portfolio directly instead of using the combination of uncertainties of the individual assets. There are only few studies which model the return of each asset by L-R fuzzy numbers (Jalota et al., 2017b; Vercher, 2008; Vercher et al., 2007). In this paper, we extend the literature on multiobjective portfolio selection model by assuming that the return on each asset is an L-R power fuzzy variable.

Another issue is that portfolio decision-making based on fitting of L-R fuzzy numbers is usually developed in a possibilistic environment. In fact, to the best of our knowledge, there are only three studies which treat portfolio return by means of credibility distributions (Jalota et al., 2017a, 2017b; Vercher & Bermúdez, 2015). Credibility measures are consistent with the law of excluded middle and the law of contradiction (i.e., they have the self-duality property), which is needed both in theory and in practice. In this way, it is fundamental to study their application as the basic measure of the occurrence of a fuzzy event in the portfolio selection problem.

Most portfolio optimization models in the literature have been evaluated in financial markets such as the Madrid Stock Exchange (Spain) (Bermúdez et al., 2012), the National Stock Exchange of Mumbai (India) (Mehlawat, 2016), the Shanghai Stock Exchange (China) (Ren et al., 2017) and the New York Stock Exchange (USA) (J. Liu et al., 2015), among others. To the best of our knowledge there are not empirical studies that have been developed in Latin American capital markets. Thus, this study makes a contribution to the literature by applying a portfolio optimization model in the Latin American Integrated Market (MILA by its Spanish acronym) which integrates the stock exchange markets of Chile, Colombia, Mexico, and Peru.

The concept of optimal portfolio falls under modern portfolio theory (Markowitz, 1952). It assumes that investors act rationally and always try to minimize risk while striving for the highest return possible. One well-known measure to evaluate portfolio performance is the Sortino ratio (Sortino & Price, 1994). It is a modification of the Sharpe ratio and focuses on returns that are below a certain threshold. The Sortino ratio exhibits more power and less bias than the Sharpe ratio when the distribution of excess returns is skewed. In order to select the optimal portfolio, in this paper we define for the first time the credibilistic Sortino ratio as the ratio between the credibilistic risk premium and the credibilistic semivariance.

In this paper, the stochastic mean-semivariance portfolio selection model is extended to a credibilistic multiobjective model, where apart from return and risk, also liquidity is considered to measure portfolio performance. Return and liquidity are considered as L-R power fuzzy variables. The decision process of this novel approach considers not only the multidimensional nature of the portfolio selection problem but also realistic constraints required by investors. Concretely, it optimizes the expected return, the semivariance and the expected liquidity of a given portfolio, considering budget, bound and cardinality constraints. The introduction of these realistic constraints convert the problem into a constrained multi-objective problem that is NP-hard, and traditional methods of optimization cannot be used to find efficient portfolios. To overcome this problem, the Non-dominated Sorting Genetic Algorithm II (NSGA-II) is applied. An empirical study is presented to show the effectiveness and efficiency of the proposed approach.

The remainder of the paper is structured as follows: Section 2 introduces some basic definitions and notations regarding L-R fuzzy numbers and the credibility theory. Section 3 describes the multiobjective credibilistic mean-semivariance-liquidity (MCMSL) portfolio selection model. Section 4 presents the solution methodology to solve the above model with the NSGA-II algorithm. Section 5 illustrates our proposal with an empirical study using a data set from the MILA Market. Finally, the main conclusions are drawn in Section 6.

2. L-R Fuzzy numbers and credibility theory

This section briefly presents some essential definitions regarding L-R fuzzy numbers and the credibility theory for a better understanding of the proposed multiobjective credibilistic mean-semivariance-liquidity portfolio selection model that is introduced in section 3.

2.1. L-R Power fuzzy numbers
Definition 1. Functions L, R (Dubois & Prade, 1980). The functions $L, R{:}[0,1]{\rightarrow}[0,1]$ are reference functions of a fuzzy number $\tilde{A}=\left(x, \mu_{\tilde{A}}\left(x\right)\right)$, they satisfy the following conditions:
(i) $L(1) = R(1) = 0$, $L(0) = R(0) = 1$
(ii) $L(x)$ and $R(x)$ are strictly decreasing and upper semicontinuous functions.

Definition 2. L-R Fuzzy number (Dubois & Prade, 1980). A fuzzy number $\tilde{A}$ [i.e. $\tilde{A}=(a, b, c, d)_{L_{\pi}R_{\rho}}$] is said to be an L-R fuzzy number if its membership function has the following form:

$$\mu_{\tilde{A}}\left(x\right)=\begin{cases} L_{\pi}\left(\dfrac{b-x}{b-a}\right), & \text{If } a{\leq}x{<}b \\ 1, & \text{If } b{\leq}x{\leq}c \\ R_{\rho}\left(\dfrac{x-c}{d-c}\right), & \text{If } c{<}x{\leq}d \\ 0, & \text{Otherwise} \end{cases}$$

where (b – a) and (d – c) show the left and right spreads of $\tilde{A}$, respectively; $[b, c]$ is the core of $\tilde{A}$, i.e., $[b, c]=\{x/\mu_{\tilde{A}}\left(x\right)=1\}$; L_{π} and R_{ρ} are the reference functions that define the left and right shapes of $\tilde{A}$, respectively. Following Jalota et al. (2017a), this study considers the reference functions of the power family of positive parameters π and ρ, where $L_{\pi}(k)=1-x^{\pi}$, and $R_{\rho}(k)=1-x^{\rho}$, respectively. Throughout this paper, L-R power fuzzy numbers will be denoted by $\tilde{A}=(a, b, c, d)_{\pi,\rho}$.

2.2 Credibility theory
Credibility theory, founded by B. Liu (2004) y refined by B. Liu (2007), is a branch of mathematics that studies the behavior of fuzzy phenomena.

Definition 3. Credibility measure (B. Liu & Liu, 2002). Let ξ be a fuzzy variable with membership function μ, and x a real number. The credibility measure of a fuzzy event, characterized by $\xi \leq x$, is defined by eq. (1).

$$Cr\{\xi{\leq}x\}= \frac{1}{2}\left(\sup_{y{\leq}x}\mu(y)+ 1-\sup_{y{>}x}\mu(y)\right), \quad \forall x{\in}R \tag{1}$$

The credibility measure $Cr\{\xi{\leq}x\}$ of L-R power fuzzy numbers is obtained deriving the eq. (1) (Jalota et al., 2017a):

$$Cr\{\xi \leq x\} = \begin{cases} 0, & \text{If } x \leq a \\ \frac{1}{2}\left(1 - \left(\frac{b-x}{b-a}\right)^{\pi}\right), & \text{If } a < x < b \\ \frac{1}{2}, & \text{If } b \leq x \leq c \\ \frac{1}{2}\left(1 + \left(\frac{x-c}{d-c}\right)^{\rho}\right), & \text{If } c < x < d \\ 1, & \text{If } d \leq x \end{cases}$$

As $Cr\{\xi > x\} = 1 - Cr\{\xi \leq x\}$, therefore

$$Cr\{\xi > x\} = \begin{cases} 1, & \text{If } x \leq a \\ \frac{1}{2}\left(1 + \left(\frac{b-x}{b-a}\right)^{\pi}\right), & \text{If } a < x < b \\ \frac{1}{2}, & \text{If } b \leq x \leq c \\ \frac{1}{2}\left(1 - \left(\frac{x-c}{d-c}\right)^{\rho}\right), & \text{If } c < x < d \\ 0, & \text{If } d \leq x \end{cases}$$

Definition 4. Expected value (B. Liu & Liu, 2002). Let ξ be a fuzzy variable. Then the expected value of ξ is defined by eq. (2) provided that at least one of the two integrals is finite.

$$E(\xi) = \int_0^{+\infty} Cr\{\xi \geq x\} dx - \int_{-\infty}^0 Cr\{\xi \leq x\} dx \tag{2}$$

The crisp equivalent expression for the credibilistic expected value of an L-R power fuzzy number is obtained deriving eq. (2) (Jalota et al., 2017a):

$$E(\xi) = \frac{1}{2}\left[b + c + \frac{\rho(d-c)}{\rho+1} - \frac{\pi(b-a)}{\pi+1}\right] \tag{3}$$

Definition 5. Semivariance (B. Liu & Liu, 2002). Let ξ be a fuzzy variable with finite expected value $e = E[\xi]$. Then the semivariance of ξ is defined by eq. (4).

$$SV[\xi] = E\left[([\xi-e]^-)^2\right] \tag{4}$$

where,

$$[\xi-e]^- = \begin{cases} \xi-e, & \text{Si } \xi \leq e \\ 0, & \text{Si } \xi > e \end{cases}$$

Finally, the crisp equivalent expression for the credibility-measure-based semivariance of an L-R power fuzzy number was derived by Jalota et al. (2017a):

$$SV(\xi)=\begin{cases} \dfrac{(e-a)^2}{2} - \dfrac{(e-a)(b-a)}{\pi+1} + \dfrac{(b-a)^2}{(\pi+1)(\pi+2)} + \dfrac{(e-c)^{\rho+2}}{(d-c)^\rho(\rho+1)(\rho+2)}, & \text{If } c<e\leq d \\[2ex] \dfrac{(e-a)^2}{2} - \dfrac{(e-a)(b-a)}{\pi+1} + \dfrac{(b-a)^2}{(\pi+1)(\pi+2)}, & \text{If } b<e\leq c \\[2ex] \dfrac{(e-a)^2}{2} - \dfrac{(e-a)(b-a)}{\pi+1} - \dfrac{(b-e)^{\pi+2}}{(b-a)^\pi(\pi+1)(\pi+2)} + \dfrac{(b-a)^2}{(\pi+1)(\pi+2)}, & \text{If } a<e\leq b \\[2ex] 0 & \text{Otherwise} \end{cases} \qquad (5)$$

3. Multiobjective credibilistic mean-semivariance-liquidity portfolio selection model

In this section, the proposed mathematical model to solve the multiobjective portfolio selection problem in the light of the credibility theory is discussed. The parameters and variables used in this study to formulate this model are:

Parameters

ξ_{r_i}: fuzzy rate of return of the i-th asset denoted by an L-R power fuzzy number $\xi_{r_i}=\left(a_{r_i}, b_{r_i}, c_{r_i}, d_{r_i}\right)_{\pi_{r_i}, \rho_{r_i}}$,

ξ_{l_i}: fuzzy liquidity of the i-th asset denoted by an L-R power fuzzy number $\xi_{l_i}=\left(a_{l_i}, b_{l_i}, c_{l_i}, d_{l_i}\right)_{\pi_{l_i}, \rho_{l_i}}$,

ξ_{r_p}: fuzzy expected return of the portfolio denoted by an L-R power fuzzy number $\xi_{r_p}=\left(a_{r_p}, b_{r_p}, c_{r_p}, d_{r_p}\right)_{\pi_{r_p}, \rho_{r_p}}$,

e: expected return of the portfolio,
u_i: maximal fraction of the capital allocated to the i-th asset ,
l_i: minimal fraction of the capital allocated to the i-th asset ,
k : number of assets in the portfolio.

Decision variables

ω_i: proportion of the total funds invested in the i-th asset,
y_i: a binary variable indicating whether the i-th asset is contained in the portfolio. It takes value 1, if the i-th asset is included in the portfolio, otherwise takes value 0.

3.1 Objective functions
Return
Considering that in financial markets several non-probabilistic factors may affect asset returns, this paper assumes that an investor has decided to allocate his/her total wealth among n risky assets that offer fuzzy returns. The core, support and shape parameters of the fuzzy return of each asset are obtained from the empirical percentiles of their historical returns (Vercher, 2008; Vercher & Bermúdez, 2012, 2013, 2015). The support of ξ_{r_i}, that is, the interval $[a_{r_i}, d_{r_i}]$ is given by the 3th and 97th percentile, respectively. The core of ξ_{r_i}, that is, the interval $[b_{r_i}, c_{r_i}]$ is given by the 45th and 55th percentile, respectively. The positive shape parameters π_{r_i} and ρ_{r_i} are obtained in such a way that the fuzzy and empirical quartiles coincide, that is, $\pi_{r_i}=\dfrac{\text{Ln } 0.5}{\ln s}$, where $s=\dfrac{b_{r_i}- 25\text{th percentile}}{b_{r_i}- a_{r_i}}$, and $\rho_{r_i}=\dfrac{\text{Ln } 0.5}{\ln h}$, where $h=\dfrac{75\text{th percentile } - c_{r_i}}{d_{r_i}- c_{r_i}}$. Then, the maximization of the expected return of the portfolio can be expressed as:

$$\text{Max } F_1(\omega_i)=\sum_{i=1}^{n}\left[\left[\frac{1}{2}\left[b_{r_i}+c_{r_i}+\frac{(d_{r_i}-c_{r_i})\rho_{r_i}}{\rho_{r_i}+1}-\frac{(b_{r_i}-a_{r_i})\pi_{r_i}}{\pi_{r_i}+1}\right]\right]\omega_i\right] \qquad (6)$$

Risk

Portfolio risk is estimated by means of the semivariance measure. Thus, the minimization of semi-variance of the portfolio can be expressed as:

$$\text{Min } F_2(\omega_i)=\begin{cases}\dfrac{(e-a_{r_p})^2}{2}-\dfrac{(e-a_{r_p})(b_{r_p}-a_{r_p})}{\pi_{r_p}+1}+\dfrac{(b_{r_p}-a_{r_p})^2}{(\pi_{r_p}+1)(\pi_{r_p}+2)}+\dfrac{(e-c_{r_p})^{\rho_{r_p}+2}}{(d_{r_p}-c_{r_p})^{\rho_{r_p}}(\rho_{r_p}+1)(\rho_{r_p}+2)}, & \text{If } c_{r_p}<e\leq d_{r_p}\\[2ex] \dfrac{(e-a_{r_p})^2}{2}-\dfrac{(e-a_{r_p})(b_{r_p}-a_{r_p})}{\pi_{r_p}+1}+\dfrac{(b_{r_p}-a_{r_p})^2}{(\pi_{r_p}+1)(\pi_{r_p}+2)}, & \text{If } b_{r_p}<e\leq c_{r_p}\\[2ex] \dfrac{(e-a_{r_p})^2}{2}-\dfrac{(e-a_{r_p})(b_{r_p}-a_{r_p})}{\pi_{r_p}+1}-\dfrac{(b_{r_p}-e)^{\pi_{r_p}+2}}{(b_{r_p}-a_{r_p})^{\pi_{r_p}}(\pi_{r_p}+1)(\pi_{r_p}+2)}+\dfrac{(b_{r_p}-a_{r_p})^2}{(\pi_{r_p}+1)(\pi_{r_p}+2)}, & \text{If } a_{r_p}<e\leq b_{r_p}\\[2ex] 0 & \text{Otherwise}\end{cases} \qquad (7)$$

Liquidity

Liquidity is one of the most important aspects that concern decision-makers in portfolio selection. Liquidity is defined as the probability of converting an investment into cash without any significant loss in value (Arenas-Parra et al., 2001; Gupta, Mittal, et al., 2013). Generally, investors prefer portfolios which can be liquidated at higher expected values as well as portfolios for which liquidation values are more certain. In this study, the liquidity of an asset is defined by the stock liquidity indicator:

$$\text{Liquidity}=\frac{\text{DOT}}{\text{TDP}}\left(\sqrt{\left(\frac{\text{NST}}{\text{TAS}}\right)\left(\frac{\text{TSV}}{\text{TAV}}\right)}\right) \qquad (8)$$

where DOT is the number of days within the observed period in which the stock was at least traded once; TDP is the total number of days in the period; NST is the number of stock trades during the period; TAS is the total trades of all stocks during the period; TSV is the trading stock volume in USD in the period and TAV is the trading volume of all stocks in USD in the period.

Because of incomplete information, stock liquidity indicators are only vague estimates. This study assumes that the indicators of stock liquidity are fuzzy numbers. The parameters of the L-R power fuzzy numbers are obtained from the empirical percentiles of the historical liquidity data, as previously explained. The maximization of the expected liquidity of the portfolio can be expressed as:

$$\text{Max } F_3(\omega_i)=\sum_{i=1}^{n}\left[\left[\frac{1}{2}\left[b_{l_i}+c_{l_i}+\frac{(d_{l_i}-c_{l_i})\rho_{l_i}}{\rho_{l_i}+1}-\frac{(b_{l_i}-a_{l_i})\pi_{l_i}}{\pi_{l_i}+1}\right]\right]\omega_i\right] \qquad (9)$$

3.2 Constraints

Capital budget constraint on the assets is expressed as

$$\sum_{i=1}^{n} \omega_i = 1 \tag{10}$$

No short selling of assets is expressed as

$$\omega_i \geq 0, \quad i=1, 2, \ldots, n \tag{11}$$

Maximal fraction of the capital that can be invested in a single asset is expressed as

$$\omega_i \leq u_i y_i, \quad i=1, 2, \ldots, n \tag{12}$$

Minimal fraction of the capital that can be invested in a single asset is expressed as

$$\omega_i \geq l_i y_i, \quad i=1, 2, \ldots, n \tag{13}$$

Number of assets held in the portfolio is expressed as

$$\sum_{i=1}^{n} y_i = k, \tag{14}$$
$$y_i \in \{0,1\}, \quad i=1, 2, \ldots, n$$

3.3 The decision problem

The multiobjective credibilistic mean-semivariance-liquidity portfolio selection model is formulated as:

$$\text{Max } F_1(\omega_i)$$
$$\text{Min } F_2(\omega_i)$$
$$\text{Max } F_3(\omega_i)$$

$$\text{s.t.} \begin{cases} \sum_{i=1}^{n} \omega_i = 1, & i=1, 2, \ldots, n \\ \omega_i \geq 0, & i=1, 2, \ldots, n \\ \omega_i \leq u_i y_i, & i=1, 2, \ldots, n \\ \omega_i \geq l_i y_i, & i=1, 2, \ldots, n \\ \sum_{i=1}^{n} y_i = k \\ y_i \in \{0,1\}, & i=1, 2, \ldots, n \end{cases}$$

Following Vercher and Bermúdez (2013), an admissible portfolio P^e is said to be Pareto-efficient if there is no other admissible portfolio P^o such that $P^o_{F1(\omega_i)} \geq P^e_{F1(\omega_i)}$, $P^o_{F2(\omega_i)} \leq P^e_{F2(\omega_i)}$, and $P^o_{F3(\omega_i)} \geq P^e_{F3(\omega_i)}$, with at least one strict inequality. The set of Pareto-efficient portfolios defines the efficient frontier, which could be seen as a surface in the 3-D space of the three objectives F (F1, F2, F3).

4 Solution methodology

In the above paragraph, a multiobjective credibilistic portfolio selection model was formulated where their objective functions correspond to the crisp goals of return, risk and liquidity. Note that the calculation of expected return, downside risk and expected liquidity depends on both i) the characteristics of the L-R power fuzzy returns and the L-R power fuzzy liquidity of each asset, and ii) the average of the fuzzy numbers. Furthermore, the introduction of realistic constraints into the suggested model convert the problem from a classical quadratic optimization problem to a quadratic mixed-integer problem that is NP-hard. In order to overcome this drawback, multiobjective evolutionary algorithms (MOEAs) have been successfully applied for generating solutions of the constrained portfolio optimization problems.

The most commonly-used MOEA for solving the constrained portfolio optimization problem is the Non-dominated Sorting Genetic Algorithm II (NSGA-II) (Liagkouras & Metaxiotis, 2015), first introduced by Deb et al. (2002), which is the one applied in our study. The procedural steps of this algorithm are those described by Deb et al. (2002) and Palanikumar et al. (2009).

The experimental parameters' configuration for testing this algorithm are: population size (400), distribution index for crossover (10); probability of crossover (0.9); distribution index for mutation (50); probability of mutation (0.01); and the maximum number of generations (500). Fig. 1 shows the overall structure of the MCMSL modelling approach.

5 Experimental results

5.1. Data description

The Latin American Integrated Market is an integrated trading venture between the stock markets of Chile, Colombia, Mexico and Peru that began operating in May 30, 2011. MILA market allows, for example, Mexican investors to buy Chilean or Colombian securities without the need to open brokerage accounts in these two foreign stock markets. While the individual MILA markets are relatively small, their combination provides investors with a larger set of securities to choose. In this way, they can extend their possibilities of diversification and potentially improve the risk-return trade-off in their portfolios.

In order to illustrate the usefulness of the MCMSL model, this paper presents a real-world empirical study using for the first time a data set extracted from the MILA market. The data correspond to weekly closing adjusted prices and their indicators of stock liquidity, observed in t = 239 periods from June 03, 2011 until December 25, 2015. According to the World Federation of Exchanges (WFE) by the end of 2015 the number of listed companies in the MILA market were 804. The candidate stocks to be included in the investment portfolio must meet following two conditions during the study period: i) they have been traded every week; and ii) they have an average monthly trading volume higher than the average monthly trading volume presented on their own national stock market. Once these conditions are considered, only 29 assets, n=29 are available. The exchange codes of the 29 assets are PFDAVVNDA, PFBCOLOM, CORFICOLCF, ALFA, ALSEA, AC, ASUR, BIMBO, BOLSA, CEMEX, KOF, FEMSA, GCARSO, GENTERA, GFNORTE, GMEXICO, GAP, MASECA, KIMBER, LIVERPOOL, TLEVISA, AESGENER, AGUAS-A, CHILE, BCI, ITAUCORP, CCU, ENELCHILE and SM-

CHILE B. For convenience in the description of the notation, we label these 29 assets successively as A1, A2,…, A29.

5.2. Results

Returns of assets rit are obtained as $r_{it} = (p_{it} - p_{it-1})/(p_{it-1})$, i = 1, 2, …, 29; t = 1, 2, …, 239, where pit is the closing price of the i-th asset on Friday of week t. Then, the membership function of the L-R fuzzy return (ξ_{r_i}) and the liquidity (ξ_{l_i}) are obtained from the empirical percentiles of their historical returns and indicators of stock liquidity, respectively, as was explained in Section 3.

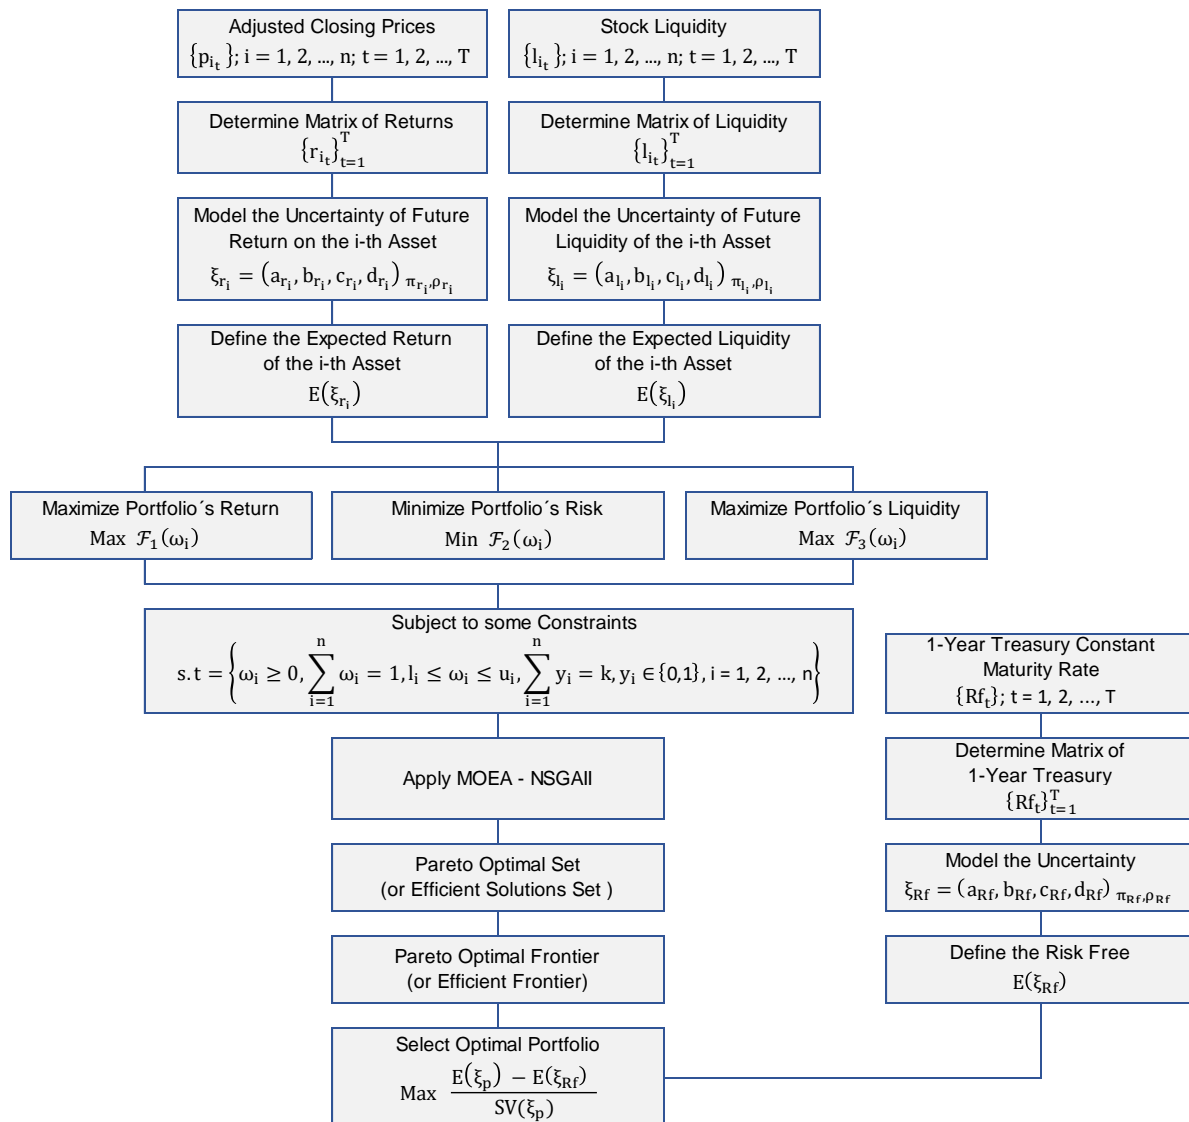

Figure 1. Overall structure of the MCMSL modelling approach.

Tables 1 and 2 show the fuzzy data regarding return and liquidity for the 29 selected assets, and their crisp credibilistic mean values. When the parameters of the membership function of each L-R fuzzy return are analyzed, it is noted that the left and right spreads are different, i.e., (b-a) ≠ (d-c). This evidence confirms the existence of asymmetry in the 29 fuzzy returns and, therefore, the choice of the semivariance was the most appropriate decision.

Table 1. L-R Fuzzy return of the assets and their crisp credibilistic mean values.

A29	$(0.00408, 0.00770, 0.00881, 0.02005)L_{0.96621}R_{0.44606}$	0.009100

Let us assume that the diversification parameters are given by $l_i= 0$ and $u_i= 0.3$ for every $i = 1,2, …, 29$. Following Gupta et al. (2014), it is not advisable to have very few or very large number of assets in the portfolio so as to achieve diversification. According to these authors, portfolio diversification by investors lies in the narrow range of 3-10 assets. Thus, following this recommendation, this study considers to set $k = 10$ assets for an admissible portfolio.

Fig. 2 shows a 3-dimensional plot of the final populations generated by NSGA-II for the MCMSL model. The group of points represents the set of non-dominated solutions (or efficient portfolios) for which none of the three objectives (return-risk-liquidity) can be improved without deteriorating another objective. NSGA-II supplies sets of efficient portfolios distributed over the Pareto optimal front, which provide investors with a true picture of trade-offs. Furthermore, each pair of functions has been plotted in bi-dimensional images in Fig. 3. It can be observed that bi-objective coverages of these Pareto optimal fronts present a suitable performance.

Figure 2. Pareto optimal front of the MCMSL model

Additionally, it is worthy to analyze the influence of the inclusion of liquidity as an additional portfolio selection criterion. Figure 3a shows that portfolios with the highest liquidity have the highest risk and the lowest return. Furthermore, high-return portfolios have medium and low risk but are rather illiquid. This outcome is confirmed by Fig. 3b and 3c. As expected, it is not possible for any portfolio to score well in all three criteria. There is no portfolio that dominates the rest in terms of achieving high return, low risk and at the same time being very liquid. For that reason, the most liquid portfolios are riskier and less profitable than their peers, while the most illiquid portfolios, in turn, are less risky and more profitable.

In order to analyze the relationship between the three criteria (return, risk and liquidity), Spearman's rank partial correlation coefficient is applied. Doing this, the coherence of the relationship between return and risk can be checked, removing the influence of liquidity on both variables. We expect both variables to have a positive correlation, but the previous graphical analysis of Fig. 3a-c does not provide a clear answer. Furthermore, thanks to Spearman's rank partial correlation coefficient we can get to know the relationship of both variables with liquidity. As presented in Table 3, there is a positive correlation between return and risk, meaning that more profitable portfolios are riskier. Regarding liquidity, more liquid portfolios are risker, but less profitable. Conversely, less liquid portfolios are less risky and more profitable.
(a) Downside Risk vs. Expected Return
(b) Expected Liquidity vs. Expected Return

(c) Downside Risk vs. Expected Liquidity
Figure 3. Values of the three corresponding objective functions for all the solutions generatedby NSGA-II

Table 3. Spearman's rank partial correlation matrix

	Return	Risk	Liquidity
Return	1.000		
Risk	0.660**	1.000	
Liquidity	-0.811**	0.940**	1.000

Note: ** Correlation is significant at the 0.01 level

This relationship between liquidity and risk can be explained by the fact that more liquid assets are traded more often and therefore are subject to more volatility, increasing their risk. Regarding the liquidity-return correlation, the result suggests that companies which are traded more often are not so profitable than those with less trades.

This paper has proposed a multiobjective approach to portfolio optimization considering return, risk and liquidity. In any given real-world investment scenario, an investor needs to pick a portfolio along the Pareto optimal front Fig. 3 that meets his/her preferences. In order to select the optimal portfolio, this study uses the Sortino ratio, which gauges the risk-adjusted return of an investment asset or portfolio. The Sortino ratio in a credibilistic environment is computed as:

$$\text{Sortino Ratio}=\frac{E\left(\xi_p\right) - E\left(\xi_{Rf}\right)}{SV(\xi_p)} \tag{15}$$

where, $E(\xi_p)$ is the expected fuzzy return of the portfolio, $SV(\xi_p)$ is the fuzzy semivariance, and $E(\xi_{Rf})$ is the target or required rate of return, that is, the US 1-Year Treasury Constant Maturity Rate.

Table 4. ETF versus optimal portfolio selected

	VaR	Return	Liquidity
ETF MILA TRC	0.2920	0.0488	0.0167
Optimal Portfolio	0.2150	0.0651	0.0327

Finally, it is convenient to compare the performance of the optimal portfolio resulting from the MCMSL model proposed with the performance of a similar investment alternative in the market. Table 4 compares the optimal portfolio selected using the proposed Sortino ratio with its benchmark, the ETF MILA TRC, which tracks the MILA market. Table 4 shows that the selected portfolio beats the benchmark regarding the three selected criteria, return, risk and liquidity. Thereupon, it is confirmed that the applied multiobjective portfolio selection model offers promising results for investors seeking additional goals beyond the return-risk optimization.

6. Conclusions

This paper extends the stochastic mean-semivariance model to a credibilistic multiobjective model in which return, risk and liquidity are employed to measure portfolio performance. In order to quantify the uncertainty of the future returns and the liquidity of each risky asset, this study proposes to use L-R power fuzzy numbers, where its membership function is build using the sample percentiles of the historical data set of the returns and liquidity, respectively. Non-dominated Sorting Genetic Algorithm II (NSGA-II) is applied to select efficient portfolios in the fuzzy return-risk-liquidity trade-off in the presence of cardinality constraint and upper and lower bound constraints. To illustrate the usefulness of the proposed model and the solution approach for the multiobjective

portfolio selection, this paper presents a real-world empirical study using a data set extracted from the Latin American Integrated Market MILA. The computational results of the numerical experiments establish that the proposed MCMSL model supplies sets of efficient portfolios uniformly distributed over the Pareto optimal front, which provide the investor a true picture of trade-offs. Additionally, by maximizing the Sortino ratio for the first time in a credibilistic environment, this study selects the optimum investment weights in a portfolio, and analyzes its performance in relation to another alternative investment during a period of one year.

Based on the fuzzy set theory, this research developed a novel approach by employing a distinctive return-semivariance-liquidity measure to gauge the portfolio performance in Latin American emerging financial markets. In view of the above discussions, this study concludes that the proposed model provides decision-makers with an effective and practicable alternative to solve the portfolio selection problem.

Abstract. The number of companies in Indonesia that have participated in environmental-related activities continues to grow. Some of these companies have also engaged and implemented an assessment program called Program for Pollution Control, Evaluation, and Rating (PROPER). This assessment program was initially launched by the Indonesian Ministry of Environment in 1995 to measure and rate the environmental performance of companies in Indonesia. They have also administered an environmental management system as part of their environmental protection initiatives. However, the level of environmental disclosure by these companies is still low. This may occur due to the current situation in which the companies are not obliged to incorporate environmental disclosures on their annual reports. For those companies that disclose their environmental performance, there is also no apparent reason on why they have done that. This research aims to examine the effect of environmental performance, company financial performance, and company characteristics on environmental disclosure. The population used in this research comprised of all registered non-financial companies in the Indonesia Stock Exchange in 2014–2016. The sample was selected using a purposive sampling method to obtain 36 sample companies and analyzed through multiple regression analysis. Results show that the environmental performance variable, which is described by PROPER ratings and environmental management systems, and company size variable, both affect the extent of environmental disclosures. However, the financial performance variable, which is described by companies' profitability and leverage, and the number of board commissioners variable, both do not significantly affect the extent of environmental disclosures.

Keywords: environmental disclosure; environmental performance; financial performance; company characteristics; PROPER; Indonesia; listed companies

1. Introduction

Climate change and global warming are issues that have been widely explored. Surrounded by these issues, companies are obliged to participate in exploring and protecting the environment because the environment is the facilitator of a business organization (Sen, Mukherjee & Pattanyak, 2011). One of the efforts that can be made by companies around the world as a form of attention and commitment to protecting the environment is conducting environmental disclosures. Corporate environmental disclosure is a process of communicating information related to environmental activities, which are commonly done through various types of media, such as annual reports, stand-alone sustainability reports, or company websites (Bhatia & Makkar, 2019; Djajadikerta and Trireksani, 2012; Inekwe, Hashim & Yahya, 2020; Ismail, Rahman & Hezabr, 2018; Lu & Taylor, 2016; Ong & Djajadikerta, 2018; Sharma, 2019; Zhang, Djajadikerta & Zhang, 2018).

In relation to sustainability reporting standards, nonprofit organizations that echo the importance of environmental sustainability have formed an initiative called the global reporting initiative (GRI). GRI was first established by the Coalition for Environmentally Responsible Economies in Boston, United States, in 1997. This organization initially established standard guidelines for sustainability reporting with six items of disclosure indicators: economy, environment, employment practices and work convenience, human rights, society, and responsibility for products. It has since made several revisions and developed more comprehensive guidelines (Bidari & Djajadikerta, 2020).

Environmental performance affects the extent to which environmental disclosure and its impact will become a company risk (Cormier and Magnan, 1999). According to Cho and Patten (2007), companies can gain legitimacy by providing their environmental disclosure. Additionally, participating in external environmental performance assessments is another way for companies to gain legitimacy. The premise is that companies with an adequate level of environmental performance have more opportunity and may have a tendency to provide a higher level of environmental disclosure. However, many prior studies have revealed inconsistent results of the relationship between environmental performance and environmental disclosure (Ong, Trireksani & Djajadikerta, 2016). Some studies found a positive correlation between environmental performance and environmental disclosure (e.g., Plumlee et al., 2015; Purwantini et al., 2019), while some others showed a negative correlation (e.g., Patten, 2002).

Former studies also point out numerous outcomes on the relationship between company financial performance and the extent of environmental disclosure. Some results indicated a positive or negative correlation, and some of them initiate no correlation (Elijido-Ten, 2007; Lima Crisóstomo, de Souza Freire & Cortes de Vasconcellos, 2011). Many researchers investigated the correlation between company characteristics (such as type of industry, firm size, company age, etc.) and environmental discussion, and most of the results found that they are significantly related (Branco & Rodrigues, 2008). Larger companies tend to be more provide comprehensive information about their environmental activities and more visible to external audiences and their stakeholders (Liu & Anbumozhi, 2009). It can be said large companies may increase their reputation by communicating their environmental disclosure to the public (Branco & Rodrigues, 2008).

Currently, there are no regulations requiring Indonesian companies to disclose their environmental activities or performance (Devie et al., 2019). Some studies show that the environmental disclosure practice conducted by Indonesian companies is still relatively low. A study by Trireksani and Djajadikerta (2016), for example, indicates that the extent of environmental disclosures made by the listed mining companies in Indonesia was merely moderate. Another study by the Center for Governance, Institutions, and Organizations of the National University

of Singapore Business School, using the GRI index, revealed that the quality of CSR implementation, which includes environmental disclosure, by Indonesian companies, was relatively lower than those of most of the other Southeast Asian nations (Suastha, 2016). This may occur due to the fact that reporting on environmental performance in Indonesia is still voluntary.

In 2002, however, the Indonesian government, through its Ministry of the Environment, developed a nationwide evaluation program, namely, Program for Pollution Control, Evaluation, and Rating (PROPER) (Deswanto & Siregar, 2018; Sulaiman, Abdullah & Fatima, 2014). PROPER is an assessment of environmental performance by companies carried out by the Indonesian government. This program aims to increase awareness and efforts of companies to preserve the environment. PROPER has five rankings, namely, gold, green, blue, red, and black, which respectively represent exceptional, excellent, good, bad, and poor rating given to companies based on their performance and environmental disclosures.

This study aims to examine the effect of environmental performance, financial performance, and company characteristic on environmental disclosure within the Indonesian listed companies context by utilizing its national PROPER instrument and the inclusion of ISO 14001 certification as one of the explanatory variables. An environmental management system is a part of the overall management system that includes organizational structure, responsibilities, implementation, procedures, and resources to develop, implement, achieve, evaluate, and maintain environmental policies (ISO 14001, 2004). A good or poor environmental management system of a company can be described by ISO 14001 certification. Companies with this certification indicate that they already have a good environmental management system. Therefore, ISO 14001 certification can be considered one of the proxies in assessing the environmental performance of a company. The findings of this study are expected to assist in the decision-making process related to environmental disclosure as initiated by companies, investors, and regulators. Furthermore, our results are expected to enrich knowledge related to environmental disclosures.

This paper is divided into several sections. Section 2 presents the conceptual background and hypothesis development. Section 3 describes the research method, Section 4 discusses the findings, and Section 5 presents conclusion and limitations.

2. Literature review and hypotheses development

2.1 Literature review
Stakeholder theory states that a company has responsibilities involving several parties, including shareholders and other stakeholders (Freeman et al., 1984). This theory assumes that stakeholders determine the existence of a company. As such, it needs to maintain relationships with stakeholders and avoid disrupting the achievement of company goals. Companies should focus on the environment and long-term sustainable development (Elsayih, Tang & Lan, 2018). One of the efforts to maintaining relationships with stakeholders that can be carried out by a company is providing environmental disclosure (Huang & Kung, 2010). The companies can use environmental disclosure as a means to connect to their stakeholders.

According to legitimacy theory, there is a "social contract" between companies and the society (Deegan, 2000), which leads to the companies disclosing their social and environmental report voluntarily (Luo, Tang & Lan, 2013). Therefore, company managements are expected to provide and disclose their companies' corporate social responsibility activities to the public (Archel et al., 2009; Zhang, Djajadikerta & Trireksani, 2019). Nowadays, the legitimacy theory has become an important theory in environmental disclosure studies that indicates that companies use environmental disclosure as one of their tools to keep their legitimacy.

2.2. Environmental performance

The environmental performance of a company in Indonesia can be revealed by PROPER ratings and environmental management systems. PROPER is a rating system that can indicate a good or bad environmental performance of a company based on the assessment by the Ministry of the Environment. Accordingly, companies with better PROPER ratings could be more easily make more significant environmental disclosures than companies with lower PROPER ratings. Some previous studies have found evidence that the PROPER ranking affects environmental disclosures (Deswanto & Siregar, 2018; Pradini & Kiswara, 2013; Prasetya & Yulianto, 2018; Sulaiman, Abdullah & Fatima, 2014)

Similarly, some companies apply and seek ISO 14001 certification to show that their companies have an excellent environmental management system. Companies that use ISO 14001 on environmental management systems tend to enhance environmental disclosure because they want to show the results of their environmental performance to stakeholders. Some previous studies (Nurhayati, Taylor & Tower, 2015; Yusoff Othman & Yatim, 2013) found a significant relationship between environmental management systems and environmental disclosures. This study proposes the following hypotheses:

H1: Companies with better PROPER ratings would have a higher environmental disclosure than companies with poorer PROPER ratings.

H2: Companies with better environmental management systems would make a greater extent of environmental disclosure than companies with poorer environmental management systems.

2.3. Financial Performance

Financial performance is a measure that can be used to describe the performance of companies in the financial sector. The theory of stakeholders explains that companies are responsive not only to shareholders but also to other stakeholders and the environment. Companies need to carry out activities that can be used to show their responsibilities to stakeholders, and one of them is by providing environment disclosure. The financial performance of a company can be described on the basis of profitability and leverage ratios.

Profitability is a ratio that describes a company's ability to generate profits by using its resources. Companies with a high profitability level likely present a high environment disclosure because profitable companies tend to have more resources to do environmental disclosure. Large resource ownership can be used to show a company's contribution to the environment to reduce social pressure from a community and give a positive impression to stakeholders (Giannarakis, 2014; Ismail et al., 2018). Some previous studies revealed the positive influence of profitability to environmental disclosure (Kansal, Joshi & Batra, 2014; Lu & Abeysekera, 2014; Muttakin & Khan, 2014).

Leverage is a ratio that can describe a company's ability to pay off its debts. Companies with a high leverage level possibly have a great extent of environmental disclosures because companies with high debts need to make other performance disclosures as a form of information that a company is in good condition. Furthermore, companies with a high leverage degree have a large-interest-bearing capital so that the existence of companies depends on lenders. This risk encourages companies to provide evidence of disclosure as a form of concern for the environment (Sulaiman et al., 2014). Some previous studies (Ismail et al., 2018; Yanto & Muzzammil, 2016) found that leverage positively affects environmental disclosure. This study proposes the following hypotheses:

H3: Companies with higher levels of profitability would provide a greater extent of environmental disclosure than companies with lower levels of profitability.

> **H4**: Companies with higher levels of leverage would provide a greater extent of environmental disclosure than companies with lower levels of leverage.

2.4. Company characteristic

Legitimacy theory explains that companies try to ensure that activities are in accordance with norms and rules and accepted by outsiders (Elsayih et al., 2018). Furthermore, operational activities are in a frame, and norms exist in a society and the environment where a company is located; one of these activities that is relevant to this study is environmental disclosure. Companies use environmental-related performance and disclosure to justify a company's operations without endangering the environment (Liao, Luo & Tang, 2015).

One of the characteristics of companies can be observed through the size of a company. Large-categorized companies will receive considerable attention from the public. As such, large-categorized companies will receive more significant pressure from the public. Furthermore, large companies have greater resources and shareholders. This advantage can be used by companies to make environmental disclosures as a way to reduce the existing social pressure. It has been found that in the gas and oil industry, the size of a company positively affects environmental disclosure (Ismail et al., 2018). Some other studies have also found evidence that company size influences environmental disclosure (Ben-Amar & McIlkenny, 2015; Fontana et al., 2015; Ismail et al., 2018; Muttakin & Khan, 2014; Wahyuningrum & Budihardjo, 2018). This study proposes this following hypothesis:

> **H5**: Large companies would present a greater extent of environmental disclosure than smaller companies.

3. Methodology

3.1. Samples and data collection

This research uses secondary data taken from annual reports and sustainability reports of all the listed companies in the Indonesia Stock Exchange (ISX) in 2014–2016. The period of data collection was chosen since 2014 was the year when the country had gained significant continuous improvement in its political stability since the start of the Reformation. In Indonesia, 1998 marked a new era called Reformation, ending the ruling of the previous regime for over three decades, which started the country's road to democracy (Indonesia Investments, n.d.). Data from the Global Economy site showed that the country's political stability index had risen from -1.73 in 1998 to -0.42 in 2014 (Global Economy, n.d.) (this was the year when the country, for the first time, reached an index score above -0.5 since the Reformation era started in 1998). Political stability is essential for business environments since it affects business practice and stakeholder confidence (Euromonitor Research, 2014). The research sample is selected through purposive sampling with the criteria described in Table 1 as follows.

Table 1. Sample selection criteria

Criteria	Number of Samples
ISX registered non-financial companies in 2014–2016	406
Non-financial companies that do not publish reports on social responsibility	346
Non-financial companies that do not provide complete information	24
Non-financial companies used for samples per annum	36
Number of samples (2014–2016)	108
Outliers	36
The total number of samples used (2014–2016)	72

A total of 36 analysis units are categorized as outliers after normality testing. As such, the data are eliminated in this research. The number of analysis units after outlier elimination is 72.

3.2. Variable measurement and analysis

The dependent variable in this research is environmental disclosure (EnvDisc). The indicators are adapted from a sustainability reporting standard, namely, GRI G4 2016, which was developed by the Global Sustainability Standards Board and launched in October 2016. GRI G4 includes reporting indicators on economic, social, and environmental impacts. This research focuses on the indicators of environmental disclosure, and hence adapts only the thirty items of environmental disclosure described in the GRI G4. They consist of three items on material; five items on energy; three items on water; four items on disclosure on biodiversity; seven items on emission; five disclosure items on wastewater (effluent) and solid waste; one disclosure item on compliance; and two disclosure items on harmony. An explanation of each of the environmental disclosure items in the GRI 2016 index is presented in Table 2 as follows.

Table 2. Environmental disclosure items in GRI G4 2016

No	**Indicator**	**Code**	**Explanation**
301	Material	EN1	Materials used based on weight or volume
		EN2	The input material from recycling is used
		EN3	Reclaimed products and their packaging materials
302	Energy	EN4	Energy consumption in organizations
		EN5	Energy consumption outside organizations
		EN6	Energy intensity
		EN7	Reducing energy consumption
		EN8	Reduction in the energy needed for products and services
303	Water	EN9	Water withdrawal based on sources
		EN10	Water sources that are significantly affected by water withdrawal
		EN11	Water recycling and reuse
304	Biodiversity	EN12	Operational locations that are owned, leased, managed, or adjacent to protected areas and areas with high biodiversity values outside protected areas
		EN13	Significant impacts of activities, products, and services on biodiversity
		EN14	Habitat that is protected or returned
		EN15	Number of species included in national conservation data and habitat in areas affected by operations based on the risk of extinction
305	Emission	EN16	Direct GRK emissions
		EN17	Indirect GRK energy emissions
		EN18	Other indirect GRK emissions
		EN19	GRK emission intensity
		EN20	GRK emission reduction
		EN21	Ozone-depleting substances emissions
		EN22	Nitrogen oxide (NOx), sulfur oxide (SOx), and other significant air emissions
306	Wastewater (effluent) and solid waste	EN23	Release of water, based on type and method of disposal
		EN24	Waste based on disposal type and method
		EN25	Significant spill
		EN26	Transport of hazardous waste
		EN27	Water bodies that are affected by the release and overflow of water
307	Compliance	EN28	Noncompliance with environmental laws and regulations

No	**Indicator**	**Code**	**Explanation**
308	Harmony	EN29	Selection of new suppliers using environmental criteria
		EN30	Negative environmental impacts in the supply chain and actions taken

Source: GRI G4 index, 2016

EnvDisc variable is measured using the adapted GRI G4 environmental index by giving a score on environmental disclosure found in each item, that is, 1 for disclosure and 0 for no disclosure. For each sample, all disclosure scores are added so that the total environmental disclosure score for each sample is obtained. The total environmental disclosure score is then divided by 30, which is the total overall environmental disclosure items in the GRI 2016 index, to obtain the mean score.

The effects of the independent variables on the dependent variable (i.e., EnvDisc) are examined through a multiple regression analysis using the SPSS 21 software. The multiple regression equation is explained as follows:

$$EnvDisc = \alpha + \beta_1 EnvPer + \beta_2 EnvMS + \beta_3 Prob + \beta_4 Leve + \beta_5 Size + \beta_6 Board + e,$$

where environmental performance (EnvPer) is measured by giving a score on the ranking color of each company in PROPER:, i.e., black = 1, red = 2, blue = 3, green = 4, and gold = 5; environmental management system measurement (EnvMS) uses a dummy variable with a score of 1 = the company has ISO 14001 and 0 = the company does not have ISO 14001; profitability (Prob) is obtained by dividing profit after tax with total assets; leverage (Leve) in this research is measured by comparing the amount of debt with total assets; and company size (Size) is measured using the natural logarithms of the total asset. This research uses good corporate governance as a control variable that is proxied by the size of the board of commissioners (Board), which is measured by the number of board members of each sample company.

4. Findings and discussion

Environmental disclosures made by each sample company on each of the GRI G4 environmental indicators are presented in Table 3.

Table 3. GRI 2016 Environmental Disclosure Item 2014–2016

No	Indicator	Code	2014	2015	2016
301	Material	EN1	3%	3%	3%
		EN2	4%	4%	4%
		EN3	0%	0%	0%
302	Energy	EN4	3%	3%	3%
		EN5	0%	0%	0%
		EN6	0%	0%	0%
		EN7	10%	14%	13%
		EN8	0%	0%	0%
303	Water	EN9	1%	1%	1%
		EN10	0%	0%	0%
		EN11	4%	4%	4%
304	Biodiversity	EN12	0%	0%	0%
		EN13	0%	0%	0%
		EN14	1%	1%	1%
		EN15	0%	0%	0%
305	Emission	EN16	1%	1%	1%
		EN17	1%	1%	1%

No	Indicator	Code	2014	2015	2016
		EN18	0%	0%	0%
		EN19	0%	0%	0%
		EN20	25%	31%	28%
		EN21	0%	0%	0%
		EN22	0%	0%	0%
306	Wastewater	EN23	1%	1%	1%
	(effluent) and	EN24	3%	3%	3%
	solid waste	EN25	0%	0%	0%
		EN26	1%	1%	1%
		EN27	0%	0%	0%
307	Compliance	EN28	0%	0%	0%
308	Harmony	EN29	0%	0%	0%
		EN30	0%	0%	0%

One item in the emission indicator, i.e., "GRK emission reduction", is disclosed the most by the sample companies (25% in 2014, 31% in 2015, and 28% in 2016). It can be seen that the disclosures made by the entire sample company on this item are much higher than those made on the other items in each period.

The second most revealed item is "reducing energy consumption" within the energy indicator, i.e., 10%, 14%, and 13% respectively in 2014, 2015, and 2016. There is no disclosure found in the compliance and harmony indicators in the sample companies' annual reports, sustainability reports, and/or official websites.

Table 3 also shows that, overall, the extent of environmental disclosure made by the listed companies in the Indonesia Stock Exchange from 2014 to 2016 is low. This low extent of disclosure is purportedly due to the absence of rules that require every company in Indonesia to disclose the environmental performance that they have conducted on their company's official reports and pages.

Table 4 illustrates the comparison of environmental disclosure in each industrial sector in Indonesia in 2014–2016. These sectors include agriculture; mining; basic industry and chemicals; miscellaneous industries; consumer goods industries; trade, service, and investment; and property, real estate, and building.

Table 4. Comparison of GRI G4 environmental disclosure item between sectors

Industry	301	302	303	304	305	306	307	308	Mean
Agriculture	0.0%	0.0%	0.0%	0.0%	14.3%	0.0%	0.0%	0.0%	1.8%
Mining	0.0%	0.0%	33.3%	25.0%	14.3%	0.0%	0.0%	0.0%	9.1%
Basic Industry and Chemicals	13.3%	10.7%	6.7%	0.0%	14.3%	0.0%	0.0%	0.0%	5.6%
Miscellaneous Industries	0.0%	6.7%	0.0%	0.0%	14.3%	0.0%	0.0%	0.0%	2.6%
Consumer Goods Industries	9.7%	8.4%	6.5%	0.0%	10.1%	3.9%	0.0%	0.0%	4.8%
Property, Real Estate, and Building Constructions	0.0%	20.0%	0.0%	0.0%	14.3%	0.0%	0.0%	0.0%	4.3%
Trade, Service, and Investment	0.0%	40.0%	0.0%	0.0%	28.6%	40.0%	0.0%	0.0%	13.6%

Note: 301: Material; 302: Energy; 303: Water; 304: Biodiversity; 305: Emissions; 306: Wastewater (Effluent) and Solid Waste; 307: Compliance; 308: Harmony

Trade, service, and investment are the industry that has the highest level of environmental disclosure based on the GRI G4. This industry makes 40% of energy disclosures, 28.6% of emissions, and 40% of wastewater (effluent) and solid waste, with an average disclosure of 13.6%. It is followed by the mining industry with an average disclosure of 9.1% by disclosing three indicators, namely, water, biodiversity, and emission with disclosure values of 33.3%, 25%, and 14.3%, respectively. Agriculture industry has the least environmental disclosure with only an emission disclosure of 14.3% and an overall average disclosure of 1.8%. This finding shows that environmental disclosures carried out by each industrial sector in Indonesia are overall still relatively low.

Table 5 presents the descriptive statistics of each variable in this study. The dependent variable in this research is environmental disclosure (EnvDisc). EnvDisc has an average value, a minimum value, and a maximum value of 0.064344, 0.0.0333, and 0.2000, respectively. The average value of 6.43% indicates that environmental disclosures in sample companies in Indonesia are relatively low. The independent variables in this research are PROPER (EnvPer) rank, environmental management system (EnvSM), profitability (Prob), leverage (Leve), and company size (Size).

The PROPER (EnvPer) ranking variable based on Table 5 shows that the highest-ranking obtained by the sample companies is "green" with a maximum value of 4.000. Conversely, the lowest rating obtained by sample companies is "red", as evidenced by a minimum value of 2.000, and the average sample company is ranked "blue" with a value of 3.0278. Furthermore, the sample companies have an environmental management system (EnvMS) in the form of ISO certification. As many as 50 sample units have been ISO 14001 certified, whereas 22 sample units have not been ISO 14001 certified.

According to table 5, the profitability variable (Prob) has a minimum value, a maximum value, an average value, and a standard deviation of 0.0008, 0.4394, 0.087517, and 0.0754107, respectively. The lowest and highest leverage variables are 0.0532 and 0.6688, respectively. Company size (Size) has an average value of 29.181656, with a standard deviation of 1.8376017. The standard deviation that is smaller than the average value indicates that the size of the company measured using the total logarithms of a company's asset is considered quite good because this value suggests that the sample is in the average calculation area and that company size data do not significantly differ from one another.

Table 5. Descriptive Statistics of Research Variables

	N	Min	Max	Mean	Std. Deviation
Dependent					
EnvDisc	72	0.0333	0.2000	0.064344	0.0393051
Independent					
EnvPer	72	2.0000	4.0000	3.027778	0.3742494
Prob	72	0.0008	0.4394	0.087517	0.0754107
Leve	72	0.0532	0.6688	0.375971	0.1655904
Size	72	25.1075	32.1510	29.181656	1.8376017
Control					
Board	72	3.0000	9.0000	5.138889	1.6555970
Categorical					
				N	%
EnvMS				72	100
1 = companies that have an ISO 14001				50	69
0 = companies that do not have an ISO 14001				22	31

The results of the normality test via the Kolmogorov–Smirnov test reveal that the data are normally distributed with a significance value of 0.490. Another classic assumption test shows no signs of multicollinearity with tolerance, and the VIF values of each research variable are >0.1 and <10 (Table 6). Furthermore, no problem of autocorrelation occurs because the value of Durbin Watson shows a number of 1.986. This value is greater than dU and smaller than 4-dU 1.8019 < 1.986 < 2.1981. With the heteroscedasticity test involving the white test, where the value of c2 count < c2 table is 45.22 < 91.67, so no symptoms of heteroscedasticity are found.

Table 6 shows the results of the hypothesis testing. First, the PROPER rating (EnvPer) measured using values of 1 to 5 in each rating color obtained by the company is proven to have a significantly positive effect on environmental disclosure. The value of the t count is 2.675, with a significance of 0.009 (sig at 0.05). This finding supports the stakeholder theory, which states that companies are responsible not only for shareholders but also for stakeholders and the environment. This positive influence shows that companies with better PROPER ratings make higher environmental disclosures than companies that obtain poorer PROPER ratings. It may indicate that companies with good PROPER ratings feel the need to do greater environmental disclosure. This disclosure is one of the ways to improve reputation in the view of stakeholders and serve as a "show off" that the companies have a deep concern for the environment. This finding is consistent with previous studies (Deswanto & Siregar, 2018; Pradini & Kiswara; 2013; Prasetya & Yulianto, 2018; Tadros & Magnan, 2019), which found a relationship between PROPER ratings and environmental disclosures.

Table 6. Results of hypothesis testing

Model	Prediction	Unstd Coef		Std Coef	t	Sig.	Multicollinearity	
		B	Std. Error	Beta			Tolerance	VIF
(Constant)		−0.166	0.085		−1.964	0.054		
EnvPer	+	0.030	0.011	0.288	2.675	0.009	0.984	1.017
EnvMS	+	−0.025	0.009	−0.295	−2.649	0.010	0.917	1.090
Prob	+	−0.051	0.063	−0.099	−0.820	0.415	0.786	1.273
Leve	+	0.001	0.028	0.004	0.032	0.975	0.827	1.210
Size	+	0.006	0.002	0.280	2.513	0.014	0.914	1.094
Board	+	−0.003	0.003	−0.119	−1.065	0.291	0.907	1.103

a. Dependent Variable: EnvDisc
$R2 = 0.260$
Adjusted $R^2 = 0.192$
Significance at 0.05
$N = 72$

The second hypothesis states that a company with a good management system makes environmental disclosures higher than a company with a poor unproven management system. EnvMS has a significantly negative effect on environmental disclosure with a t count value of -2,649 and a significance value of 0.010. It may indicate that companies with ISO 140001 certification feel that they have good environmental performance, so they feel that making environmental disclosures is unnecessary because they have successfully obtained this certification. Conversely, companies that do not yet have an ISO 14001 certificate feel the need to make environmental disclosures as a form of positive signaling to the public that the company has carried out their environmental performance well as evidenced by conducting environmental disclosures. Some previous studies (Ismail et al., 2018; Nurhayati et al., 2015; Yusoff et al., 2013), however, found no evidence that EnvMS affects environmental disclosure.

Third, profitability (Prob) does not have a significant effect on environmental disclosure. The results of this test do not support the stakeholder theory, which states that companies are responsive not only to shareholders but also to stakeholders and the environment. This may indicate that companies with high profitability assume that they do not need to disclose matters that may interfere with information related to their financial success, including making environmental disclosures. Such companies may consider that environmental disclosure could disrupt the focus of a community to obtain information on the success of a particular company so that it will not conduct environmental disclosures with the aim that stakeholders focus more on information on their financial success. The study of Qiu, Shaukat and Tharyan (2016) on non-financial companies in the United Kingdom in 2005–2009, also found no relationship between environmental disclosure and company profitability. This finding is also supported by the previous studies by Nor, Bahari, Adnan, Kamal and Ali (2016) and Wahyuningrum and Budihardjo (2018), and some other studies with slightly different findings (Kansal et al., 2014; Lu & Abeysekera, 2014; Muttakin & Khan, 2014).

Fourth, leverage (Leve) that is measured using debt to assets is not proven to influence environmental disclosure. The test results presented in Table 5 reveal that the value of the t count is 0.032, with a significance value of 0.975 > 0.05. This finding does not support the stakeholder theory, which states that companies are responsive not only to shareholders but also to stakeholders and the environment. This insignificant influence may be caused by a good relationship between a company and a debtholder. This good relationship prevents a debtholder from paying too much attention to information related to environmental disclosures. A company uses this scheme as an opportunity to avoid making environmental disclosure because it focuses on maintaining good relations with debtholders. Furthermore, environmental disclosures may be considered as costs that can reduce the profits earned. Hence, they prefer to allocate profits to pay debts and maintain good relations with debtholders rather than making environmental disclosure. These results are consistent with the previous study (Deswanto & Siregar, 2018) that did not find a significant effect of leverage on environmental disclosure. Conversely, another study (Ismail et al., 2018) found a significant effect of leverage on environmental disclosure.

Fifth, the size of the company (Size) in this research has a significantly positive effect on environmental disclosure with a t count value of 2.513 and a significant level of 0014 < 0.05. The results of the test support the legitimacy theory, which explains that companies that make environmental disclosures carry out an activity that can be accepted by society. This observation is reinforced by the results of the test, which shows the t count value of 2.513 with a significance level of 0.014 < 0.05.

Large companies tend to receive considerable attention from communities, so they receive a high amount of pressure. Large companies have greater resources and shareholders, so the environmental disclosure made by these companies is greater than that of small-categorized companies. These results are consistent with those of Choi, Lee and Psaros (2013), who found that the size of a company affects the disclosure of carbon emissions in companies in Australia. This finding was also supported by the previous studies (Ben-Amar & McIlkenny, 2015; Fontana et al., 2015; Ismail et al., 2018; Kansal et al., 2014; Muttakin & Khan, 2014; Wahyuningrum & Budihardjo, 2018; Yanto & Muzzammil, 2016) that found a significantly positive relationship between company size and environmental disclosure. However, these results do not support the research conducted by a previous study Gatimbu & Wabwire(2016) that did not find any influence of company size on environmental disclosure.

The control variable in this research is the board of commissioners (Board) proxied by the number of the board of commissioners in each company. The study does not find that this variable has a significant influence on environmental disclosures. The value of the t count is -1.065, with a significance of 0.907 > 0.05. This finding does not support the stakeholder theory. This nonsignificant influence may be due to the position of the board of

commissioners, who are representatives of shareholders, which encourage them to use profits for operational activities that are more profitable for companies than using them for social activities. The absence of this social activity may make companies with larger board of commissioners do not make environmental disclosures. These results contradict the findings of a previous study by Fernandes, Bornia, and Nakamura (2019) that examined the influence of the board of directors on environmental disclosures at the Sao Paulo Stock Exchange registered in Brazil.

5. Conclusion

Based on the disclosure index, most item disclosed by companies in their annual reports, sustainability reports, and/or official websites is "GRK emission reduction" followed by "reducing energy consumption" within the energy indicator in three years period (2014-2016). In contrast, it seems that all companies do not disclose one indicator item, namely compliance and harmony even in their annual reports. Generally, it can be concluded that the extent of environmental disclosure referred to GRI G4 is low. This low level of environmental disclosure indicates that most of the Indonesian companies have not yet kept an eye on the standard of sustainability reporting. Some of them do not provide any information about environmental in their annual reports and or sustainability reports. Since the disclosure is still voluntary, many companies still have not followed the standards and regulations.

Environmental performance is a form of company awareness in managing its resources for environmental management. This study used two measurements, namely PROPER and ISO 14001. According to PROPER rating, most companies have a "blue" rank, and the lowest rating companies have a "red" rank. In addition, more than 50% of companies have been ISO 14001 certified. This study found that PROPER rank has a significant effect on the extent of environmental disclosure; meanwhile, the environmental management system, proxied by ISO 14001, has a significantly negative effect on the extent of environmental disclosure. This results may indicate that most companies in reporting their environmental activities still do not follow the GRI guidelines even though some of them have ISO 140001 certification. The relationship between company characteristic, which is described in terms of company size, the environmental disclosure is significantly positive. The results of this study support the legitimacy theory and provide some indication that large companies feel that they have more responsibility to society and, therefore, provide a greater extent of environmental disclosure in their reports. However, the financial performance, which is described by profitability and leverage, found to have no effect on the environmental disclosures.

Overall, the findings of this study may be useful for companies, investors, and regulators in formulating policies to make decisions related to environmental disclosure. This study is also expected to provide further insights into environmental disclosure literature. This study, nevertheless, acknowledges some limitations. Firstly, many companies do not include environmental disclosures in annual reports and sustainability reports. As such, the samples obtained are rather limited. This study also uses the GRI G4 2016 index as a tool to measure environmental disclosures. Further studies could explore and use another proxy. Future studies should also consider other variables that likely influence environmental disclosures.

Indah Fajarini Sri WAHYUNINGRUM is Secretary of Accounting Department, Faculty of Economics, Universitas Negeri Semarang (UNNES), Indonesia, from 2018 onwards. She took her Doctoral Degree in 2013 and graduated in 2017 at Edith Cowan University, Perth, Western Australia. She completed her bachelor's and Master's degree at Universitas Diponegoro (UNDIP). She has been actively teaching subjects such as Accounting Principles, Advanced Accounting, Accounting Theory, Research Methodology, etc. Her research and publication interests include environmental accountinf, sustainability reporting, and sustainability. She is also a member of Institute of Certified Sustainability Practitioners (ICSP) and Chartered Accountants Indonesia (IAI) until now.
ORCID ID: orcid.org/0000-0003-3246-4101

Mochamad Arief BUDIHARDJO is an Associate Professor at the Department of Environmental Engineering, Diponegoro University, Indonesia. His teaching areas are solid waste management, environmental economics, and environmental management at both undergraduate and postgraduate levels. His research and publication interests include environmental management (particularly solid waste) and environmental sustainability. Currently, he is managing a sustainability center at his university. He is also a member of the International Solid Waste Association, Indonesian Society of Sanitary and Environment Engineers (IATPI), and the Institution of Engineers Indonesia (PII). **ORCID ID:** orcid.org/0000-0002-1256-3076

Fadel Iqbal MUHAMMAD is an MSc Environmental Sciences student at Wageningen University & Research (WUR), the Netherlands, and a research assistant at Diponegoro University, Indonesia. He received a fellowship from the Indonesian Endowment Fund (LPDP) because of his contribution to community development on resilient communities. He is actively involved in conducting research related to environmental system engineering, especially about carbon footprint assessment and solid waste management.
ORCID ID: 0000-0002-0156-3775

Hadrian Geri DJAJADIKERTA is Associate Dean Research and Associate Professor in the School of Business and Law at Edith Cowan University, Perth, Australia. Hadrian has over two decades of leadership, research, and teaching in academia, and has previously held academic positions at the University of New South Wales, Lincoln University, and the University of Technology Sydney. His research interests include sustainability and sustainability reporting, strategic management accounting, corporate governance, corporate social responsibility (CSR), strategic alliances, and inter-firm relationships.
ORCID ID: orcid.org/0000-0003-1672-9579

Terri TRIREKSANI is Honours Coordinator in Business and Lecturer at Murdoch Business School, Murdoch University, Perth, Australia. Terri's prior experience includes years of work in academia, public accounting, and consulting for various public and private organizations in Indonesia and the US. Her research interests include sustainability reporting, accounting education, strategic management accounting, and diversity management.

Abstract. In modern conditions, improving the efficiency of logistics is of particular importance, especially for countries with developing economies. The development of logistics acts as a driver of the competitiveness of the country's economy, improving the quality of life of the population, and rational integration into the world economy. Therefore, the states of countries with developing economies face the global task of becoming a certain transit and logistics hub of the region, a "bridge" between Europe and Asia, the implementation of which directly depends on the development of transport logistics, the main factor in stimulating sustainable rates of industrial growth and the formation of competitive advantages of the economic system. The toolkit developed by the author and the results obtained can be used by state and local authorities in the development of strategies for the development of macrological systems in countries with developing economies for the medium term.

Keywords: logistics; macro-logistic systems; material and intangible logistics flows; logistics infrastructure; the mechanism of functioning of the macro-logistic system

1. Introduction

Analysis of the state and development trends of logistics in the world economy shows that in many respects the state of logistics and supply chain management (SCM) is a key factor in increasing the competitiveness potential. The global economic crisis, which over the past decades, has clearly demonstrated how important is the ability of macrologistic systems not only to reduce costs, but also to find new innovative solutions to maintain business stability in difficult and poorly predictable macroeconomic conditions. Those systems that were able to correctly assess the situation and reorganize in time to new rails of integration and coordination, both of internal logistics

business processes and relationships with counterparties in supply chains, were able not only to maintain their positions, but also to achieve significant results in increasing competitiveness and strengthening market positions. In a modern economy, the use of the principles of integrated logistics is one of the basic sources of sustainable competitive advantage for logistics systems. That is why the world's leading companies are making significant efforts to improve the efficiency of supply chains, focusing on the active involvement of logistics providers, the globalization of the location of production and logistics facilities and the implementation of the principles of integrating logistics business processes in building a business.

An effective logistics system is capable of speeding up the industrialization of the country through convergence within industrial centers, as well as creating a basis for deepening regional and Eurasian economic cooperation and further integration of countries into the world economy. Moreover, the strategically advantageous geographic location of the country allows you to receive a significant source of income through the active implementation of transit opportunities.

The intensive development of the logistics services market, the creation of a competitive environment in the field of commodity circulation and international transportation of goods, the strengthening of integration trends in the world economy make it necessary to search for adequate market mechanisms to ensure the effective functioning of the transport complex, which are considered logistics and logistics management. Hence follows the high urgency of solving problems aimed at the development of transport and logistics infrastructure, in particular, at the formation of transport and logistics hubs, as an integral and key component that ensures an increase in the efficiency of the transport complex. In the Kazakh economy, as in a country with a developing economy, logistics is a fairly young industry and, following the example of foreign countries, is only turning into a practical tool for a market economy.

2. Research background

To position and use the best practices of leading companies and countries in the field of logistics, special analytical tools are needed, in particular international ratings, which have become a source of information for analytics.
The analysis of approaches and ratings of logistics efficiency assessment at the country level existing in the world practice is presented in separate publications of such authors as V.I.Sergeev, D.I. Zinina (2016), A.P. Dolgov (2015, 2016), and others.

Professor A.P. Dolgov (2016), who studies the problems of assessing logistics in international rankings, identifies the following key points of a methodological nature:
- selection of a set of indicators that most fully characterize the evaluated phenomenon or process;
- the choice of a rational ratio between objective indicators and subjective assessments of quality characteristics;
- determination of weight coefficients characterizing the significance of certain particular indicators, estimates.
Until now, no single, well-established definition of the logistics system has been formed. According to E. Yu. Alekseycheva (2015), quite often in the economic literature there is a definition according to which a logistic system is understood as an adaptive system with feedback, which performs certain logistic operations and functions. Moreover, such a system consists of several subsystems, has developed connections with the external environment. In addition, there is another definition of V.V. Gabbasova (2016), who claims that the logistics system is a system for managing logistics processes that have feedback. These processes operate in a single multi-level structure, with a single center for the distribution of resources according to established criteria for the effectiveness of their use. This means that the system makes it possible to ensure the implementation of logistics

operations with optimal costs for moving products throughout the supply chain. Therefore, an enterprise that has organized a logistics service is able to effectively solve problems associated with reducing costs, distributing and storing products, and reducing inventories. The saved costs allow to reduce the production cost. Some researchers, such as O.S. Damdyn (2015) notes that transport logistics is understood as the organization of functioning and management of material flows, as well as the corresponding supporting and accompanying flows in the process of goods movement. Other scholars, like B. Galstyan (2018), give a broader definition of the term. They emphasize that transport logistics is the movement of products by vehicles using a specific technology, specific routes in the supply chain. Such logistics consists of logistic, technological operations and functions. At the same time, it includes forwarding, cargo handling, packaging, transfer of ownership of the cargo, prevention of threats, insurance of risks, customs procedures, etc.

Analysis of the points of view of foreign authors made it possible to single out three definitions of the logistics infrastructure:

  - according to D. Greenwald (1973) - this is a set of service industries, the list of which varies depending on the object and the operational composition of the activities of service subjects;

  - W. Stanton (1978) claims that this is a set of material and technical means that provide normal conditions for the activities of economic entities;

  - research of W. Rostow (1960) They agree that this is a set of conditions that create favorable preconditions for the development of commodity circulation in industries that meet the needs of the population.

According to A.M. Gadzhinsky (2018), the specificity of logistics consists in the allocation of a single function of management of previously disparate material flows; in the technical, technological, economic and methodological integration of individual links of the material-conducting chain into a single system that ensures effective management of end-to-end material flows.

Well-known approaches to assessing and predicting the effectiveness of logistics systems under given conditions, set forth in the works of the following domestic and foreign researchers (Table 1).

Table 1. Approaches to assessing and predicting the effectiveness of logistics systems in given conditions

Author	Approaches to assessing and predicting the effectiveness of logistics systems
Anikin B. (2016)	Criteria for the level of service in logistics are stated, where two areas of global importance are considered, associated with global logistics and logistics of "slender" production, as well as the problem of integrating organizations into the global logistics network
Gutthorna J. (2018)	Shows production and logistics activities in a smooth integration into supply chains of key business processes: production, distribution, transportation, forecasting and planning of demand, inventory management, service management and supply of spare parts, controlling and management of return material flows
Dolgov A. (2015)	The modern economic problems of regulation of flow processes and inventories in macrologistic systems of various hierarchical levels are considered
Dybskaya B. (2015)	A detailed analysis of the logistics process in a warehouse based on functional modeling is given. Specific recommendations for practitioners on the effective design and use of warehouse systems, optimization of the choice of technological and handling equipment for warehouses, planning of warehouse areas and other urgent problems of warehousing logistics are given
Kurenkov P. (2016)	The research focuses on warehouses in logistics, which perform the function of accumulating reserves, which are necessary to mitigate and damp fluctuations in the volume of demand and supply, thereby allowing the use of these resources in the event of a shortage of products on the market
Levkin G. (2019)	A comprehensive understanding of the features of material flow management in industry and trade is considered
Shulzhenko T. et al. (2017)	The classification of models and methods used in the theory of logistics is considered; analyzed

	the most famous approaches used in procurement, production and distribution logistics
Mirotin L., Levin, B. (2015)	The issues of innovative processes in the field of transport management are considered, such as trends in the development of the transport industry and the development of concepts, models and mechanisms of logistics management of an intelligent transport system
Myasnikova L. (2016)	Examines modern problems of logistics management as the most important tool for increasing the competitiveness of companies in the market
Prokofieva T., Lopatkin O. (2017)	The problems of formation and development of regional logistics transport and distribution systems are investigated
Sergeev V., Zinina D. (2016)	Analysis of the approaches and ratings of logistics efficiency assessment at the country level existing in the world practice. It is shown that the objectivity of assessing the effectiveness of logistics can be increased using regression models that reveal the relationship between macroeconomic indicators and the level of development of logistics in a particular country. The proposed models help to minimize the impact of subjective expert assessments on the final ratings
Scherbakov B. (2018), Jiao et al. (2019); Adeniran, A.O., Obembe, O.E. (2020); Mader Michelle, M., Suski Cássio, A. (2019)	Shows a view of logistics as a field of entrepreneurial activity in the management of material, information, financial and other flows. Covers the basic concepts of logistics, substantiates the functional unity and efficiency of logistics solutions

Thus, in the development of the transport and logistics system, an important place is occupied by the formation of a logistics infrastructure, regarding the essence and content of which there are different points of view and components of the infrastructure of logistics processes. Investigating the management of integrated logistics systems in the digital economy, N.A. Gvilia, A.V. Parfenov, T.G. Shulzhenko (2019) established a relationship between the level of logistic integration and the form of intercorporate logistic formations, which made it possible to select management tools for certain forms of intercorporate logistic formations, including those based on the use of digital technologies. In the work of M. Adamczak, R. Domanski, L. Hadas, P. Cyplik (2016) aspects of the formation of integration relationships between production and logistics systems and elements of the external environment are considered. O. Mortansen, O. Lemoine (2008) investigates the system integration relationships between manufacturing enterprises and 3PL logistics providers.

Questions about measuring the strength of integration relationships between elements of intersystem logistics education are considered in the works of P. Cyplic, L. Hadas, M. Adamczak, R. Domanski, M. Kupczyk, Z. Pruska (2014), where an approach to measuring the level of integration in supply chains is proposed based on the ranking of local levels of integration in the implementation of integration processes in the supply chain.

At the same time, the development of digital technologies is of great importance, including in the management of logistics activities, which makes it possible to form tools for increasing the efficiency of the activities of both individual entities and the intersystem entities formed by them. In his scientific works, Y. Kayikci (2018) just describes the depth of interorganizational logistic integration, which is determined by the form of intercorporate interaction.

C. Wong, S. Boonitt, C. Wong (2011) investigated the principles of information integration of elements in supply chains, which make it possible to assert that for the forms of interorganizational interaction, estimates can be made that characterize the levels of logistic integration, which will differ significantly. V. Lukinskiya, V. Lukinskiya, T. Shulzhenko, T. (2017) describes logistic systems that are formed with the help of various types of logistic integration, which are considered as a combination of activities, complex implementation of functions and management influences, interaction of participants in the process.

Cluster forms of the logistic system, which are reflected in the works of L. Rivera, Y.Sheffi, D. Knoppen (2016) have been studied more deeply.

Thus, in the development of the transport and logistics system, an important place is occupied by the formation of a logistics infrastructure, regarding the essence and content of which there are different points of view and components of the infrastructure of logistics processes.

3. Research questions

To assess the effectiveness of macrological systems for countries with emerging economies, authors had determined the rating of the EAEU member states by logistics efficiency sub-indices among the CIS countries.

Figure 1. Research questions
Source: compiled by authors

According to the opinions of international experts, in order to identify the efficiency of logistics in developing countries at the proper level, recommendations were made, on the basis of which the author of the article reviewed the monthly indicators of exports and imports using the example of road freight transportation among

the CIS countries for 2017-2019. To construct predicted values of export and import indicators using the example of road freight transport among the CIS countries, it is necessary to consider a trend-seasonal model, the results of which will allow us to draw conclusions about an increase in the volume of export of road freight transport among the CIS countries and make informed and effective logistics decisions (Figure 1).

The development of logistics and its investment is carried out in various countries according to individual scenarios, adjusted for the peculiarities of national economic policy, geographic, demographic characteristics, urbanization and the level of development of the general infrastructure of specific regions. This is evidenced by the predicted values of exports and imports of road freight for 2021 among the CIS countries, the conclusions of which will make it possible to adopt an effective strategy for the development of transport logistics based on the results of trend-seasonal modeling.

4. Methodological approach

In accordance with the current rules and requirements of the market, companies provide complex logistics services that are most beneficial for customers. The number of logistics providers is constantly increasing, therefore, the quality of the services provided is growing at the same time.
In the logistics service, there are five approaches, which represent different levels of provision of logistics services in the enterprise (Figure 2).
Figure 2. Concept 5- PL logistics
Source: compiled by authors

As you can see from Figure 2, there are currently five logistics concepts, which are also called PartyLogistic:
1) 1PL (First Party Logistic) - Autonomous logistics. This technology was formed back in the 70s-80s of the XX century. Its peculiarity lies in the fact that the cargo owner himself performs all the logistics operations.
2) 2PL (Second Party Logistic) - Traditional logistics. This is a partial outsourcing, in which the company takes on only a part of the logistics functions, such as planning, warehousing and the formation of supply chains, resorting to using a transport company, since it does not have the necessary own transport.
3) 3PL (Third Party Logistic) - Complex logistics outsourcing. 3PL is a system when a company for the most part or completely shifts external logistics operations to another company that will deal with this. The range of

services of a company that deals with logistics operations includes: transportation, warehousing, packaging and forwarding of goods. 3PL is used mainly by contracting companies that provide logistics and cargo transportation services.

4) 4PL (Fourth Party Logistic) - integrated logistics outsourcing. 4PL is a service where a manufacturer engages another company that will deal with full logistics, plan and design supply chains, and also transfer to it the capabilities to manage the logistics business processes of the enterprise. 4PL is used by such companies as: Toshiba, Sony, Ford and many other major companies.

5) 5PL (Fifth Party Logistic) - "virtual logistics". When a 4PL company has an opportunity to provide network business services, it becomes a 5PL company. These companies using the global information technology space are able to provide a full range of services. Striking examples are Amazon, eBay, Aliexpress (Official site of visa and transport data, 2018).

In Western countries, a classification has long been adopted, according to which 5 levels of logistics service are distinguished. The differences between them lie in the set and features of the provision of services, the level of technologies and tools used (Table 2).

Table 2. Classification levels of logistics services

Service	1PL	2PL	3PL	4PL	5PL
Service planning					+
Purchase of goods				+	+
Pick up the cargo from the supplier		+	+	+	+
Warehouse provision		+	+	+	+
Preparation of permits			+	+	+
Preparation of documents for customs			+	+	+
Calculation and payment of customs duties			+	+	+
Passage of customs clearance of cargo			+	+	+
Delivery of goods to the specified address	+	+	+	+	+

Continuous improvement of technological processes and the search for new opportunities make logistics more advanced and modern, as well as the possibility of designing and evaluating the effectiveness of a macrologistic system.

The selection is made by defining a number of criteria and their specific combination. The most demanded qualities of services in logistics companies are the following (Figure 3).

In modern conditions, the development and implementation of a strategy for the development of logistics companies using design methods and based on this forecasting methods is the most important condition for increasing the efficiency of their activities, competitiveness and sustainability in the dynamically growing economic environment of the market.

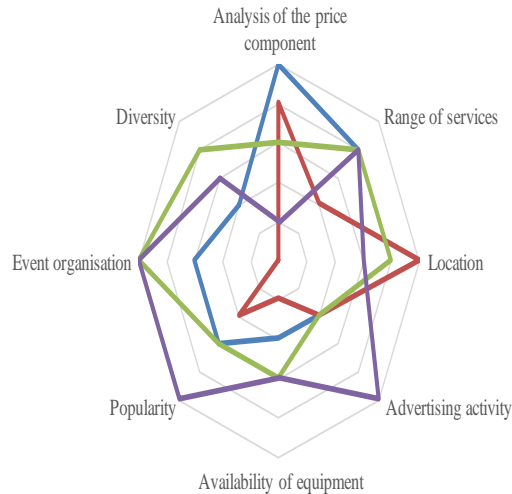
Efficient logistics can help reduce sales costs, but the weakest link in supply chains is the strength. Developing countries need to improve their infrastructure, customs system, skills and regulatory frameworks to bring logistics efficiency up to par.


Figure 3. The most demanded quality of services of logistics companies by customers
Source: compiled by authors

The efficiency of supply chains that provide access for logistics systems of developing countries to national and international markets depends on a number of factors, which, first of all, include the sustainability of supply chains, their impact on the environment and the need for skilled workers. Particular attention should be paid to the problems faced by macrological systems of countries with developing economies:

1. Both developed and developing countries face the problem of labor shortages in the field of logistics. Developing countries need more executive managers, while developed countries face labor shortages.

2. Compared to low-income countries, high-income countries are much more likely to seek to improve their cyber preparedness.

3. High-income countries are much more likely to demand environmentally friendly logistics services than low-income countries. This is important because CO_2 emissions from vehicles are a significant source of environmental pollution.

Thus, examining the problems faced by the macrological systems of countries with developing economies, we can say that a macrological system is a large material flow management system that functions over several enterprises or firms and unites dissimilar production and trade enterprises, transport and others to achieve a single goal of intermediary firms. A systematic and comprehensive analysis of the macrological system will allow us to trace the tendency of its change, the achievement of planned and actual results of the indicator, and also will allow us to find out the trends in the change in the cost of a unit of transport services, fulfillment of the plan by its level, and reduce costs. To determine the influence of various factors on the change in the cost of logistics services, to establish reserves and assess the work of logistics companies in using the possibilities of reducing the cost of production, visualization of the relationship of production processes aimed at increasing economic efficiency and help to optimize logistics companies.

The use of information technology in logistics allows us to solve a whole range of tasks with minimal costs, which encourages the development of information products, relying on the most unexpected and original ideas.

As part of modern transformations in the economic and social life of individual states, a global consumer society is being formed, in which the interests of consumers of goods and services occupy the main place in the market, where manufacturers, suppliers and sellers in such a market are obliged to satisfy the needs and requests of buyers in the shortest possible time.

Such interconnection and interaction can be achieved with the help of well-functioning logistics that ensures the efficient use of time, financial and material resources in the production and consumption of goods and services. This is evidenced by data on the number of global mergers and acquisitions in the transport and logistics industry for the period from 2013-2017, with an upward trend by 2020 (Figure 4).

$$y = 191{,}2e^{0{,}070x}$$
$$R^2 = 0{,}862$$

Source: compiled by authors according to PwC Transport and Logistics Practice Report in Central and Eastern Europe

Assessing the effectiveness of macrological systems for countries with developing economies, we note that in 2020 the number of countries that fall into the category of "developing" reached 132. All of them occupy a special place in the world economy, are in different ways connected with capitalist countries, the world economic system and market. Because of this, a multi-structured economy has long been formed in such states, depending on developed and advanced countries.

But the situation that developed at the beginning of 2020, due to the pandemic, which caused negative changes in the entire global economy, led to the fact that the market of transport and logistics services is currently experiencing ups and downs: there has been an adaptation to the sanctions regime, prices for oil and the national currency rate (Bykova, Pustokhina, 2020).

To transform the market of transport and logistics services, due to its underdevelopment, mechanisms are needed to increase the competitiveness of logistics companies and maneuver in a crisis and political tension (Repnikova, Bykova, Skryabin, Morkovkin, Noval, 2019).

The World Bank classifies countries as developing countries with low and middle income (low and middle income). Income is measured by gross national income (GNI) per capita in US dollars. Low income is $ 1.045 or less, medium income is $ 1.045 to $ 12.746.

The International Monetary Fund classifies countries into advanced countries and developing countries. As a criterion, the level of per capita income, export diversification, and the degree of integration into the world financial system are used.

Consider the rating of the EAEU member countries by logistics efficiency sub-indices among the CIS countries in 2008-2018, which looks like this (Table 3).

Table 3. Rating of the EAEU member countries by logistics efficiency sub-indices among the CIS countries in 2008-2018

Country	Year	Subindex LPI					
		Efficiency of the customs clearance process	Quality of trade and transport infrastructure	Ease of organizing international supply of goods	Quality of logistics services	Cargo tracking	Compliance with the terms of delivery of goods

Source: compiled by authors according to the source of Eurostat statistics www.eurostatica.com

Based on the values of the LPI logistics development indicator in 2018, Kazakhstan has the most developed logistics system among the EAEU member states, and Belarus and Kyrgyzstan have the least efficient ones.

According to the LPI 2018 rating, among the EAEU member states, Kazakhstan has the best indicators in the logistics sector: 84th in the subindex "ease of organizing international deliveries of goods", 83rd - tracking the passage of goods, 50th - "meeting deadlines delivery of goods".
The state of the logistics system of the Republic of Belarus is affected by insufficient investment in this sector. In order to improve the situation, a set of measures should be implemented in Belarus both in the field of improving the logistics infrastructure and searching for new approaches to management, and in the field of automation of logistics processes.

Investigating foreign indicators, Western Europe and developed Asian regions occupy a confident leadership in terms of logistics development (Official site of World Bank, 2019). Among European countries, according to the LPI 2018 ranking, indicators in the logistics sector are occupied by the following countries for the period from 2008 to 2018 (Table 4).

Table 4. Indicators in the logistics sector among developing countries of Europe according to the LPI 2018 ranking for the period from 2008 to 2018

In order to bring logistics efficiency up to par, international experts recommended that developing countries improve their infrastructure, customs system, professional skills and regulatory framework. But in order to identify these criteria for the efficiency of logistics in developing countries, the author examined the monthly indicators of exports and imports using the example of road freight transportation among the CIS countries for 2017-2019 (Table 5).

Table 5. Indicators of export and import of road freight transportation of the CIS countries for 2017-2019

Source: Source: compiled by authors according to the source of Eurostat statistics www.eurostatica.com

According to the data presented in table 5, the situation is as follows:
1 Kazakhstan
In 2019, 634 thousand tons of cargo were transported from the European Union to Kazakhstan by road, which is 14.8% more than in 2018. The increase in physical terms amounted to 82 thousand tons.

In 2019, 294 thousand tons of cargo were transported from Kazakhstan to the European Union by road, which is 24.5% more than in 2018.

2 Belarus

In 2019, 2,259.4 thousand tons of cargo were transported from the European Union to the Republic of Belarus by road, which is 3.6% more than in 2018. The increase in physical terms amounted to 77.7 thousand tons.

It should be noted that this is a significant reversal of the trend, since in 2018, compared to 2017, import road freight traffic from the EU to the Republic of Belarus decreased by 17%.

In 2019, 5191.5 thousand tons of cargo were transported from Belarus to the European Union by road, which is 6.3% more than in 2018.

In terms of countries, the largest increase in freight traffic in physical terms (tons) occurred in the direction of Lithuania, Poland and Latvia. Exports in physical terms decreased most of all to Germany.

3 Russia

In 2019, 10,610 thousand tons of cargo were transported from the European Union to the Russian Federation by road, which is 1.2% more than in 2018. The increase in physical terms amounted to 125.8 thousand tons. The positive dynamics at the end of the year was due to the growth in traffic in the second half of the year. In terms of countries, the largest increase in road transport in the Russian Federation in physical terms (tons) is noted from Poland, Finland, Italy, Hungary, Estonia. Freight traffic from Germany, the Netherlands and Romania has significantly decreased.

In 2019, 11,136.4 thousand tons of cargo were transported from Russia to the European Union by road, which practically corresponds to the level of 2018 (+ 0.15%). As a reminder, in 2018, the positive dynamics of exports was 12%). In terms of countries, the largest decrease in freight traffic in physical terms (tons) occurred in the direction of Hungary and Germany. Exports in physical terms increased most of all to Finland and Poland.

4 Ukraine

In 2019, 6,030 thousand tons of cargo were transported from the European Union to Ukraine by road, which is 9.3% more than in 2018. The increase in physical terms amounted to 511 thousand tons.

The increase in imports occurred from almost all EU countries (with the exception of the UK and Croatia), but the most significant increase in road transport to Ukraine in physical terms (tons) came from Poland (+288 thousand tons).

In 2019, 6139 thousand tons of cargo were transported from Ukraine to the European Union by road, which is 1.1% more than in 2018. The positive dynamics decreased due to the reduction in traffic in the second half of the year.

In terms of countries, the largest increase in freight traffic in physical terms (tons) occurred in the direction of the Netherlands, Bulgaria, Lithuania. Exports in physical terms decreased most of all to Germany, Hungary, Romania. In the context of cargoes from Ukraine to the EU by road transport in the export cargo traffic, the largest increase in the volume of animal and vegetable fats, household goods, glass and glass products, food industry waste and animal feed. There was a decrease in the export road transport of wood and wood products, iron and steel products, aluminum and products from it, and sugar.

Graphical analysis indicates the influence of seasonal factors on the dynamics of changes in the indicators under consideration (Figure 5,6).
Figure 5. Dynamics of the export of road freight
for 2017-2019 among the CIS countries, in tons
*Source:* compiled by authors according to www.eurostatica.com

Figure 6. Dynamics of imports of road freight
for 2017-2019 among the CIS countries, in tons
Source: compiled by authors according to Eurostat statistics www.eurostatica.com

5. Analysis and application functionality

As a result, to construct a forecast, it is advisable to use trend-seasonal models. The amplitude of seasonal fluctuations in our case is constant, therefore an additive model was used for the forecast, which is built by adding the components.

In our case, the equation of the time series, taking into account seasonal fluctuations, is represented by the formula:

$$Y=T+S+E, \qquad\qquad (1)$$

Where:
Y – time series level,
T – trend component,
S – seasonal component,
E – random component.

The construction of an additive model is reduced to calculating the values of T, S and E based on actual indicators for the previous period, namely, monthly indicators of the volume of exports and imports of road freight for 2017-2019.

The forecasting process includes the following steps:
1) Aligning the original series using the moving average method.
2) Calculation of the values of the seasonal component S.
3) Elimination of the seasonal component S from the initial levels of the series and obtaining the aligned data (T + E).
4) Analytical alignment of levels (T + E) and calculation of T values using the obtained linear trend equation.
5) Estimation of the absolute error to determine the degree of conformity of the model to the original data.
6) Building a forecast based on seasonal fluctuations (Hayaloglu, 2015).

The results of trend-seasonal modeling for the considered indicators are presented in Table 6.

The forecast values of the volumes of exports and imports of road freight transportation for 2021 are determined as the sum of the trend T and the corresponding seasonal S component (Table 7).

Table 6. Results of trend-seasonal modeling for the indicators of export and import of road freight transportation

Index	Trending component	Monthly seasonal components			
Russia

Figure 8. Forecasted values of export indicators for road freight for 2021 among the CIS countries
Source: compiled and calculated by authors

The obtained forecast indicators for the export and import of road freight for 2021 among the CIS countries indicate that the most stable dynamics is observed in Kazakhstan, while in other countries - Ukraine, Russia, Belarus, there is a certain decline. Although the indices of imports and exports in Kazakhstan are much lower, perhaps in other CIS countries. This allows us to draw conclusions that it is necessary to increase the volume of export of road freight in Kazakhstan.

6. Conclusion

The global trends of global world economic development indicate that the formation of markets for needs leads not only to the development of the market of producers. The consequence of this process, under the influence of a number of reasons and factors, is the development of logistics and logistics systems in general.
The development of logistics and its investment is carried out in various countries according to individual scenarios, as shown to us by the forecast values of exports and imports of road cargo transportation among the CIS countries, adjusted for the peculiarities of national economic policy, geographic, demographic characteristics, urbanization and the level of development of the general infrastructure of specific regions. A common feature of the logistics systems of developed European, American and Asian markets is an orientation towards modernization through the introduction of modern information technologies and an expansion of the range of IT services.

Focusing on the processes of functioning of logistics systems and supply chains of industrial enterprises, it is important to note that due to the circumstances of the development and dissemination of information technologies within the framework of the digitalization of the economy, new opportunities open up for the exchange of information between individual production, logistics and auxiliary systems and their elements, as well as produced and serviced. within the latest products and the external environment. From the standpoint of business, logistics is an integral management tool that contributes to the achievement of strategic, tactical or operational goals of its organization through effective (in terms of reducing overall costs and meeting the requirements of end users for the quality of products and services) management of material flows, service flows, and related them flows of information and finance.

Thus, in modern conditions, logistics and logistics systems are becoming important elements of the development potential of a market economy in any country, an important production segment of the economy. Logistics is more and more clearly outlining its specific role as an energetic locomotive that drives the transport conveyor for the supply of services, the transportation of goods, the organization of flows in the production of products, thereby ensuring progress towards achieving the goals of increasing the well-being of all citizens, national and economic independence.

Summing up, it should be noted that increasing competitiveness in the transport and logistics sector is always a set of measures, including the development of the material and technical base of the transport system, and the improvement of technologies with a regulatory and legal framework, as well as the development of human potential. These areas are appropriately assessed in the annual DOMESTIC LPI survey, and deserve maximum attention and decisive action from the involved government authorities and representatives of the transport business. The information obtained as a result of the study signals the presence of certain barriers hindering the development of the country's transport and logistics complex, noted by more general trends in the World Bank's LPI-2018 report. Developing economies face a wider range of transport logistics challenges that need to be addressed. An effective tool in this regard can be the adoption of a state strategy for the development of transport logistics based on positive international experience.

ECONOMIC STRATEGY OF DIVERSIFICATION OF ENTERPRISE ACTIVITIES UNDER CONDITIONS OF GLOBALIZATION

Mergul Chemirbayeva [1], Zhanat Malgarayeva [2], Almagul Azamatova [3]

[1,2,3] Narxoz University, Almaty, Kazakhstan

E-mails: [1]mergul.shemirbaeva@narxoz.kz; [2] zhanat.malgaraeva@narxoz.kz; [3]almagul.azamatova@narxoz.kz

Abstract. In modern conditions of globalization and economic integration, increased competition, instability of consumer demand, enterprises in order to ensure financial and economic stability and reduce commercial risks need to use modern development strategies and models of interaction with other market participants, which, in turn, requires improved management, mainly based on the priority of the production diversification strategy, since the diversification process is innovative, causing the use of systemic techniques and technologies of a new type, a new organization of labor and production. The article is devoted to the analysis of the economic strategy for diversifying the activities of light industry enterprises based on the implementation of innovative approaches to management, including organizational design, project management, costs, human capital, etc. The article shows that today there is no single strategy that can be used to ensure optimized performance and achieved competitive product prices.

Keywords: industry; light industry; cluster analysis; diversification; strategy; globalization; economic conditions; production volume

1. Introduction

In the present period, it becomes obvious that one of the components of the successful development of the country's light industry is the modernization orientation of the functioning of strategic mechanisms for managing the industry in order to ensure sustainable development and overcome macro- and microeconomic destabilizing factors. In these conditions, the solution of the country's most important social problems depends on the stable development of light industry.

The development of light industry should be built into the balanced growth of all branches of production of the country's industrial complex. To implement such a scenario, government support of industries is required. Due to the high rate of change in external factors that have a strong impact on the subjects of production and economic activity, especially in the WTO, light industry enterprises are faced with the task of ensuring the competitiveness of industrial enterprises in the international market.

A light industry enterprise should form its development strategies, taking into account the interests of the state, aimed at creating conditions that will result in a multi-branch, balanced, stable structure of industrial production. Currently, the priority areas in the development strategies of light industry enterprises are resource content and the final financial results without taking into account other factors that largely affect the achievement of the main development goals (Rajnoha, R., Lesnikova, P., Stefko, R., Schmidtova, J., Formanek, I. (2019); Mazzoni, F., 2020). To implement this path of development of light industry enterprises, it is necessary to have effective methods and tools to improve the development strategy of enterprises. In this regard, the need to conduct research aimed at improving the toolkit for forming a strategy for the development of light industry enterprises is of particular relevance.

At present, the domestic light industry provides domestic demand for no more than 10 percent. The state is creating conditions for the development of the industry; for this, the program "Business Roadmap - 2020" has been extended until 2025, for the implementation of which at least 30 billion tenge is allocated annually (Business Roadmap, 2020). Despite the existing problems in the industry related to the unloaded production capacities of enterprises, the lack of personnel, the lack of benefits and orders for light industry products within the country, the industry does not stand still (Official site of Tengrinews, 2019).

2. Research background

Considering the significant role of light industry in ensuring economic and strategic security, employment of the able-bodied population and raising its standard of living in the new geopolitical conditions, providing the necessary attention to the development of this industry and providing it with significant investment support, as the leading world countries do, is one of the strategic tasks state policy of the Republic of Kazakhstan.

Today Kazakhstan is at a stage of stable economic growth, the promising goal of which is the further integration of Kazakhstan into the world economic space. Textile and light industry is one of the main sectors of the economy that form the budget in many countries of the world (Brousek, 2018). The textile industry, as an ever-growing industry, is the focus of a whole cluster of studies: dedicated to building a circular or cyclical economy (Coste-Maniere, I., Croizet, E., Sette, K., Fanien A., Guezguez, H. 2018) devoted to studying the conditions for industrial development and building a circular economy to solve the problem of resource scarcity (Kumar, P., Carolin, C., 2018). In their publications, a number of authors Shevchenko I.K., Razvadovskaya Yu.V., Marchenko A.A. (2019) describe a multi-level analysis of the main economic indicators of the development of textile production, where the focus is on such indicators as capital-labor ratio, capital intensity of labor in textile production. The main directions of cluster development in the textile and light industry contributes not only to their rise in the management system of the industrial complex, but also helps to further modernize the economy as a whole. Dmitriev Yu.A., Petrukhin A.B., Shustrov L.I., Shustrov T. L. (2019) believe that a developed and highly productive system of cluster development in the industrial complex can become not only an effective mechanism for ensuring the progressive economic development of the state, but also an effective tool for transferring the country's economy to an innovative type of development. The garment industry is the oldest industrial sector with great potential and rich labor traditions. Such scientists-economists as I.F. Zhukovskaya, S.A. Trufanova, N.N.

Ivlieva (2020) devoted their research to the problems and ways of solving the enterprises of the domestic clothing industry, who proposed to apply a set of measures to stabilize production and gradually increase it: incentives, customs and tariff regulation and administrative measures.

Yusupov S. Sh., Yusupova D. T. (2020) in their studies describe the foreign experience in the development of the textile and light industry, which in the modern world occupies a high place among the industries involved in export. It has a wide range of exported goods - from yarn to finished products (clothing and knitwear). From this point of view, the export potential of the industry is huge, and its development can be selected from the conditions at the time of making a decision: the presence of a strategic investor, the world commodity market, the effectiveness of the current business plan, the level of staff readiness in accordance with the requirements of export products. As noted by E.V. Mozglyakova (2017), light industry is the most important diversified and innovatively attractive sector of the economy, providing strengthening of the country's defense capability, economic, social and intellectual security. Authors Ngai, E.T, Peng, S., Moon, K. (2014), researching the development strategies of the light industry, note that at the present stage of development of scientific developments and directions for introducing information technologies into the production process, innovative methods of dyeing and finishing fabrics, the use of digital methods color selection, automation of the product design process, the use of "artificial intelligence" in production is a prerequisite for the development of this industry in the context of digitalization and globalization of the economy. Other authors, such as Simay K. H., Deniz N. (2018), are inclined to the same opinion. They believe that increasing the science intensity of light industry is a necessary measure to resist the powerful competitive pressure from Asian manufacturers.

In this regard, the activities of organizational and production structures acquire new qualitative features and the need to improve planning and management of diversification processes.
The issues related to diversification have been considered by many scientists in their works. Thus, the first studies of diversification and integration were carried out by M. Gort in 1962 (in relation to American companies) and E. Yesinara in 1979 (in relation to Japanese companies). Development in the same direction was continued by such foreign authors as I. Ansoff (1989), A. Thompson, A. J. Strickland (1998) and others.

According to I. Ansoff (1989), early diversifications were associated with the criteria of synergy mainly with functional departments: marketing department, R&D, etc. Alas, practice has shown that the most basic criterion of synergy is the synergy of corporate governance:
1) increasing income and hedging risks;
2) availability of information support for corporate business and motivation for marketing research;
3) tax incentives;
4) technological gain due to the mutual penetration of technologies, joint research and development.
Thompson A.A., Strickland A.J. (1998) believe that the development of diversification of activities of industrial enterprises at the regional level is stimulated by the following main factors:
- systemic limitation of production concentration;
- reducing the risk from entrepreneurial activity by updating and expanding the range (assortment) of products;
- reducing the risk from structural changes and market fluctuations: the possibility of financing the reform of enterprises with a long cycle of capital turnover through production with a rapid turnover of capital;
- legal forms of control over the growth of horizontal and vertical integration of production.

The most complete definition of this concept was given by M.D. Korinko (2017), who considers diversification as an innovative process of diversified development of an economic entity through the redistribution of resources,

penetration into other areas of production and the markets of new goods and services in order to reduce risks and increase income.

M.D. Korinko (2017) notes that to assess the effectiveness of diversification, one can use indicators of enterprise activity (growth in sales, increase in market share, growth in sales income, etc.) or financial indicators (dividends, growth in the market value of shares, etc.)

The most promising approach was proposed by Poplavskaya, Zh. (2018) and others. These authors connect the diversification of the enterprise with the stages of the life cycle of the product (product) (Poplavskaya, Zh., 2018). Indeed, if you link the need for diversification with the stages of the product life cycle (for example, stages of growth and maturity), then you can get a fairly simple mechanism for determining the start time, direction and type of diversification of the enterprise.

According to research by A.S. Krasnikova, O.N. Melnikov, E.A. Starozhuk (2019) mechanism for coordinating the execution of tactical and strategic tasks of industrial enterprise subdivisions in the context of diversification is based on a flexible combination of modernized management principles for the formation of the staff of performers and the transition to strategic and tactical plans that take into account the characteristics of industrial enterprises to use the principles of diversification of production organization.

According to research by A.M. Bochkarev (2019), it is necessary to focus on the information support of industrial enterprises in the context of production diversification, where, among the tools for improving information support for the production activities of an industrial enterprise, the development and concretization of conceptual aspects and organizational and economic modeling, characterizing a new vision of the functioning of the information support system of production activities, taking into account the industry specific economic entity.

Such scientists as M. F. Wiersema, J. B. Beck (2017) dealt with the problems of modeling diversification processes at industrial enterprises, who consider models for implementing the processes of diversification of enterprises and organizations of the industrial complex.

Thus, it is advisable to consider the diversification of an enterprise's activities as a tool for managing its development, and the types of diversification depend on the scope of activity, size, resources and strategic goals of the enterprise.

3. Research questions

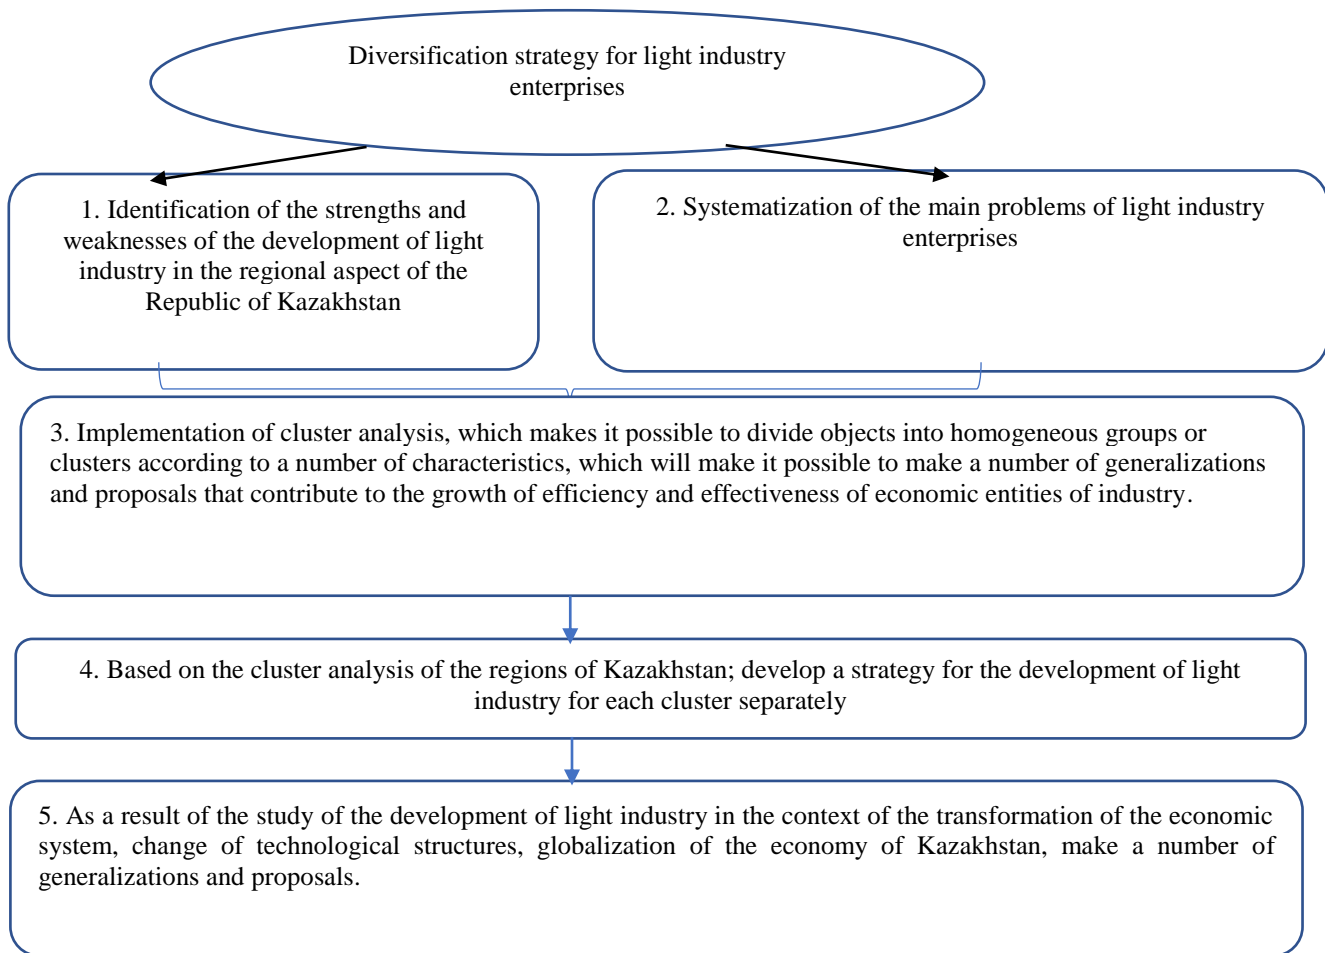
The reforms carried out by the economic policy of Kazakhstan are based on the issues of diversification and modernization of production, the creation of high-tech products with high added value, as well as increasing competitiveness and strengthening positions in the world market. Modernization, technical and technological renewal of production as the most important condition for reaching a qualitatively new level of development is one of the priorities of industrial enterprises. Light industry enterprises are no exception, where, as a study, the author will consider methods with which to consider diversification strategies for light industry enterprises (Figure 1).


Figure 1. Research questions
Source: compiled by authors

Choosing a policy of active diversification of activities, it is necessary to start with the development of a strategy that comprehensively takes into account the economic factors of production of light industry enterprises, the needs of the region in the development of change processes, the accumulated potential of industry complexes, investment and innovative conditions for doing business. Having systematized the main problems of enterprises in this industry and on the basis of these data, the author applied cluster analysis, which makes it possible to divide objects into homogeneous groups (clusters) according to a number of characteristics, on the basis of which it was revealed that the development strategy of light industry should be developed for each cluster separately.

4. Analysis and resuld of research

The textile and clothing industry of Kazakhstan covers only 10% of the needs of the domestic market. While for the formation of the country's economic security, the volume of domestic production must at least satisfy 30% of domestic demand (Official site of Ministry of finance of the Republic of Kazakhstan, 2020).
Considerable attention is paid to the development of light industry in many countries, since the industry is of social and economic importance, providing high employment for the population. The importance of this industry also lies in the fact that in terms of consumption, the light industry is in second place, behind only the food sector. In world GDP, the share of light industry is about 3%, while in the largest producing countries the indicator exceeds 10%. For example, in Portugal - 22%, China - 21%, Italy - 12%. In Kazakhstan, the impact of the industry on the economy is practically insignificant - 0.2% in the structure of GDP, and its share in the manufacturing industry is no more than 1.2%.

Kazakhstan's light industry is on the periphery of the state's attention due to the overwhelming role of the extractive industries in the economy (Figure 2).

Figure 2. Dynamics of the volume of production of light industry of the Republic of Kazakhstan for the period from 2010-2019, in million tenge
Source: compiled by authors according to official site of Kazakhstan center of industry and export, https://qazindustry.gov.kz/

Today, the light industry of Kazakhstan carries out both the primary processing of raw materials and the release of finished products. This is a complex area, which includes more than 20 sub-sectors, which can be combined into three main groups: textile, garment, as well as leather, fur and footwear. In the structure of light industry products in Kazakhstan, 51% is accounted for by the production of textiles, 38% - by production, clothing and 11% is the production of leather and related products (Figure 3) (Official site of Kazakhstan center of industry and export, 2019).
Figure 3. Dynamics of production volumes of light industry of the Republic of Kazakhstan for the period from 2012-2019, in %
Source: compiled by authors according to official site of Kazakhstan center of industry and export, https://qazindustry.gov.kz/

In the structure of light industry products in Kazakhstan, 51% is accounted for by the production of textiles, 38% by the manufacture of clothing and 11% by leather products. The overall growth of the light industry last year was 4.4%.

Based on the data in Figure 4, it can be seen that the textile industry predominates in the structure of light industry, the growth of which is provided by an increase in the production of cotton fiber, textiles and outerwear. There is a decline in the production of leather products due to a decrease in the production of footwear.

$$y = 21,29e^{0,115x}$$
$$R^2 = 0,857$$

Figure 4. Forecast values of the development of the textile industry of the Republic of Kazakhstan for 2020-2022 based on a trend model
Source: compiled by authors

The main concentration of the industry is observed in three regions in 2018 - Shymkent, Almaty region and Almaty (Table 1) (Digest on light industry, 2019).

1089

Despite the fact that during the period from 2015-2018 there were changes in the regional aspect, the indicators of the South Kazakhstan region and the city of Almaty are still leaders (Figure 5).

Figure 5. Indicators of the development of light industry production by regions of the Republic of Kazakhstan for 2018
Source: compiled by authors

It should be noted that the use of one or another strategy for the development of light industry depends on the state of this industry in a particular region of the country. In this regard, we believe it is advisable to classify all regions of the Republic of Kazakhstan according to three main indicators of light industry production - the volume of production of textiles (million tenge), clothing (million tenge), leather and related products (million tenge) (Table 2) (Official site of Ministry of finance of the Republic of Kazakhstan, 2020).

Table 2. Volumes of production of certain branches of light industry in the regions of the Republic of Kazakhstan in 2018

№	Regions	Manufacture of textiles	Manufacture of wearing apparel	Manufacture of leather and related products
1	Akmolinsk	5 157,25	514,57	203,34
2	Aktuibinsk	398,83	849,08	1,78
3	Almaty	4 884,09	8 019,28	743,39
4	Atyrau	1 817,21	490,25	12,29
5	West Kazakhstan	288,71	709,11	13,35
6	Zhambyl	169,32	1 226,16	1 788,92

Source: compiled by authors according to data's of the volume of manufactured products (goods, services) in current prices by region

To classify regions, we use cluster analysis, which allows us to divide objects into homogeneous groups or clusters according to a number of features. Objects are considered homogeneous if the observed features are in close proximity to each other. The proximity metric is the distance metric.
To solve the problem, the usual Euclidean metric was used, according to which the distance between observations is calculated by the formula:

$$d_{i,j} = \sqrt{\sum_{k=1}^{p} \left(x_{ki} - x_{kj} \right)^2}, \quad (1)$$

We find the distances between all 16 regions and build the distance matrix (Appendix 1).

From the distance matrix (Table 3) it follows that regions 2 and 5 are the closest to each other $d_{2,5} = 178,47$, so we combine them into one cluster and go to the next division.

The distance between clusters is determined according to the principle of "nearest neighbor", which is described by the formula:

$$d_{r,q} = \frac{1}{2}d_{l,q} + \frac{1}{2}d_{m,q} - \frac{1}{2}\left|d_{l,q} - d_{m,q}\right|, \quad (2)$$

where:

$d_{l,q}$; $d_{m,q}$ – geometric distances between the corresponding clusters.

So, the distance between region 1 and cluster (2 + 5) is:

$$d_{1,(2+5)} = \frac{1}{2}d_{1,2} + \frac{1}{2}d_{1,5} - \frac{1}{2}\left|d_{1,2} - d_{1,5}\right| = \frac{1}{2}\cdot 4774{,}43 + \frac{1}{2}\cdot 4876{,}13 - \frac{1}{2}\cdot\left|4774{,}43 - 4876{,}13\right| = 4774{,}43$$

Carrying out similar calculations, we obtain a new distance matrix (Appendix 2).

Finding the minimum distance between objects again $d_{14,15} = 708{,}34$, we combine them into a cluster and, according to the principle of "nearest neighbor", determine the distance between clusters. Thus, we build the distance matrix again.

We continue the calculations until the value of the minimum distance, which determines the elements to be combined, sharply increases. The sequence of combining clusters is represented as a diagram:

$$\{1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16\}$$
↓
$$\{1,2+5,3,4,6,7,8,9, 10, 11,12,13,14,15,16\}$$
↓
$$\{1,2+5,3,4,6,7,8,9, 10, 11,12,13,14+15,16\}$$
↓
$$\{1,2+5,3,4+8,6,7,9, 10, 11,12,13,14+15,16\}$$
↓
$$\{1,2+5,3,4+8,6,7+13,9, 10, 11,12,14+15,16\}$$
↓
$$\{1,2+5,3,4+8,6+10,7+13,9,11,12,14+15,16\}$$
↓
$$\{1,2+5,3, (4+8)+9,6+10,7+13,11,12,14+15,16\}$$
↓
$$\{1, (2+5)+(6+10),3, (4+8)+9,7+13,11,12,14+15,16\}$$
↓
$$\{1, ((2+5)+(6+10))+(4+8)+9,3,7+13,11,12,14+15,16\}$$
↓
$$\{1, (((2+5)+(6+10))+(4+8)+9)+(14+15),3,7+13,11,12,16\}$$
↓
$$\{1, (((2+5)+(6+10))+(4+8)+9)+(14+15)+12,3,7+13,11,16\}$$

Based on the schematic presentation of the results of cluster analysis, it can be concluded that all regions of the Republic of Kazakhstan in terms of production of textiles, clothing, leather and related products are divided into six clusters:

1- Akmola region (1),
2- Aktobe region (2), Atyrau region (4), West Kazakhstan region (5), Zhambyl region (6), Kostanay region. (8), Kyzylorda region. (9), Mangistau region (10), Pavlodar region (12), East Kazakhstan region. (14), Astana city (15);
3- Almaty region (3);
4- Karaganda region (7), North Kazakhstan region (13);
5- South Kazakhstan region (11);
6- Almaty city (16).

Thus, strategies for the development of light industry should be developed for each cluster separately.

The main concentration of the industry is observed in three regions of the Republic of Kazakhstan - these are Shymkent, Almaty region and Almaty. Based on this, we presented data for 2018 on the industry specialization of these regions (Figure 6) (Official site of data of the National Chamber of Entrepreneurs of the Republic of Kazakhstan "Atameken", 2018).

Figure 6. Industry specialization of the southern regions of the Republic of Kazakhstan for 2018
Source: compiled by authors according to Data of the National Chamber of Entrepreneurs of the Republic of Kazakhstan "Atameken" for 2018.

In 2018, in the regional context, the following enterprises were the main manufacturers of light industry:
1) South Kazakhstan region - 35%, where the main enterprises of the region can be distinguished: JSC Melange, JSC Utex, LLP AzalaTextile, LLP Zhanatalap-MT, LLP Khlopkoprom-Cellulose LLP Bal Tekstil ;
2) Almaty city - 14% with the main enterprises - Kazlegprom-Almaty LLP, KazSPO-N LLP, PKF Kazakhstan Texti-Line - Mimioriki;
3) Almaty region - 12% - LLP Mediateks-N, LLP Glasman, LLP Universal.

The maximum production growth is observed for the following products:
- finished textile products (2.6 times);

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

- sweaters, jumpers, pullovers, cardigans, etc. (2 times);
- products from natural fur (by 53%);
- leather from cattle skins or horse skins (by 29%);
- knitted socks (by 10%) (Table 5).

Table 5. The volume of production of the main types of light industry products for 2015-2019

Type of product	Unit measurements	2015	2016	2017	2018	2019
Cotton, carded and combed	tons	51337	53751	67881	71374	72177

Figure 7. Dynamics of the volume of production of the main types of light industry products for 2015-2019
Source: compiled by authors according to the light Industry Digest for the period from 2015-2019

According to Figure 6, we see that the highest demand is for the products of men's and women's outerwear, as well as fur products (Figure 8).

**Figure 8.** Dynamics of indicators of goods in demand for the period from 2015-2018
Source: compiled by authors

The demand for light industry goods is taken into account when forming a consumer basket (a group of non-food products). It is possible to distinguish groups of consumers depending on age (Figure 9) (Sedelev, 2019).

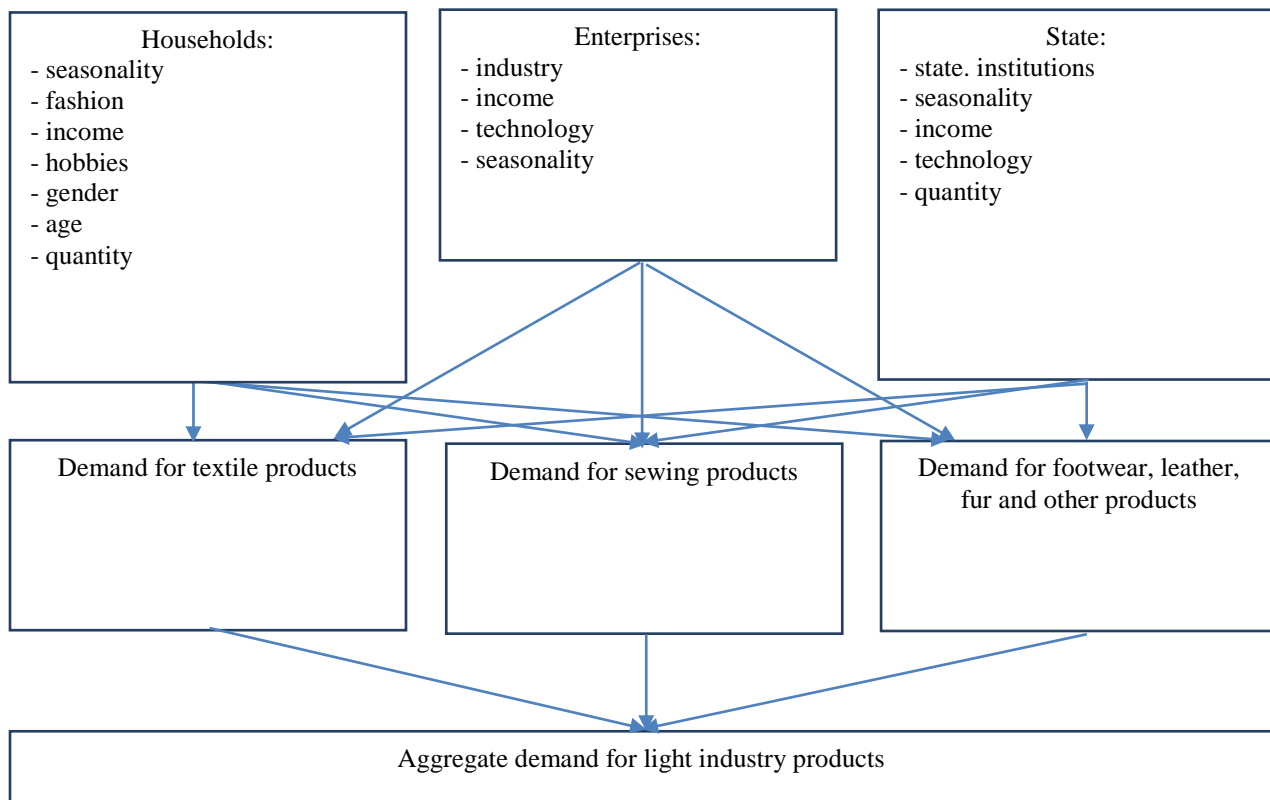

Figure 9. Aggregate demand for light industry products
Source: compiled by authors

Group 1 - children, which includes boys and girls from 0 years old to 15 years old inclusive;
Group 2 - able-bodied population, that is, aged 16 and men up to 59 years old, and women up to 54 years old;
Group 3 - pensioners, that is, men from 60 years old, women from 55 years old and until the end of life
The Republic of Kazakhstan has great potential, since Kazakhstan is in a single market with Russia and Kyrgyzstan in the EAEU, where there are no customs borders. Also, Kazakhstan has a competitive advantage in that we border with China. In this regard, we can argue that globalization affects the economies of all countries and is characterized by:
- the transformation of the world community into an integral economic system, which can be called a planetary economy;
- the weakening of state regulation as a result of the process of transformation of the national - state form of organization of people's life into a new form governed by international, multilateral agreements;
- the creation of international integration associations as a result of the merger of national markets into a "common market";
- the development of transnational capital, the financial sector and the stock market are acquiring global proportions;
- an increase in the speed of transactions as a result of the development of mobile communications, Internet technologies, which leads to an even greater interdependence of countries from each other.
In these conditions, the priority development of light industry must be coordinated with foreign trade policy and use the export financing mechanism.
For example, the export of light industry products in 2018 compared to the same period in 2017 decreased by 15.7% to $ 179 million. Imports of light industry products in 2018 amounted to $ 1,281 million, which is higher than the same period indicator of 2017 by 15.6% (Figure 10).

Figure 10. Dynamics of indicators of export and import of light industry products of the Republic of Kazakhstan for the period from 2012-2018
Source: compiled by authors according to the light Industry Digest for the period from 2015-2019

In Kazakhstan, about 10% of light industry products are exported. At the same time, export supplies are carried out by only 30 enterprises. Their products are sent mainly to the markets of China, Russia, Kyrgyzstan, Italy, Lithuania, Uzbekistan.

At the end of 2019, the export volume exceeded 20 thousand USD dollars. The main commodity groups were cotton fiber, textile materials, impregnated, coated or laminated with plastics, bed linen.
To stimulate the export of products, enterprises are reimbursed up to 50% of transport costs. This should reduce the cost of production by up to 10%, as well as expand the geography of exports and the range of goods.

Accordingly, having considered the dynamics of the development of indicators of exports and imports of light industry products of the Republic of Kazakhstan, we can analyze the structure of exports and imports of the main types of this industry (Table 6).

Table 6. Structure of exports and imports of the main types of light industry products, in %

Table 6. Structure of exports and imports of the main types of light industry products, in % Indicator	2015	2016	2017	2018
Export

Source: compiled by authors according to the light Industry Digest for the period from 2015-2019

Meeting the demand for domestic products is impossible without the introduction of innovative technologies. The main volume of footwear export was delivered to Russia, cotton fiber to Latvia, Moldova, women's and men's clothing to Russia, cotton fabrics and yarns to Lithuania, Turkey, tanned leather or leather crust to China and Italy.

A comprehensive study of the development of light industry in the context of the transformation of the economic system, change of technological structures, globalization of the economy of Kazakhstan made it possible to make a number of generalizations and proposals:
1 The study revealed the influence and relationship of the development of light industry with technological structures, since it is the textile industry that is the leading industry and has a strong influence on the development of other industries.
2. The ongoing process of globalization of Kazakhstan under the WTO conditions has a serious impact on the sub-sectors of light industry, which can be classified as vulnerable sectors of the economy. The ongoing industrial policy in the field of light industry should be coordinated with foreign economic policy in order to use the positive aspects that globalization gives (for example, a decrease in import duties on high-quality raw materials and equipment), but at the same time preserve and develop its own light industry, turning it into a competitive industry economy.
3. The study of the aggregate demand for light industry products showed that it is formed by all subjects of the market economy (households, enterprises and the state) and, under certain assumptions, corresponds to the generally accepted neoclassical concept. It is especially worth noting that light industry goods are included in the

consumer basket (group of non-food products) and belong to essential goods, the demand for which may not be elastic in a scarce, undeveloped market.

4. Experts say that one of the main problems hindering the development of the industry is the high share of gray imports. The World Bank estimates this amount at no less than $ 2 billion. Almost 90% of products enter the country without certificates of conformity, without paying any taxes. In addition, Kazakhstani producers compete in unequal conditions with producers from the EAEU countries, China and Turkey. For example, in Kyrgyzstan, all light industry enterprises, regardless of size, are tax-exempt and operate under a patent. The country managed to keep this privilege even by joining the WTO. Support is provided to both manufacturers and exporters of clothing in China and Turkey. Russian manufacturers do not remain without subsidies (Burdenko, 2018). Therefore, Kazakhstan light industry companies also need protection.

5. The strengthening of the global factors of transnationalization of the production of light industry goods has led to the fact that no national light industry sector or group of enterprises, regardless of its size and level of development, can become self-sufficient for a long time, due to the rapidly changing environment, which, taking into account the threats of competitors from other countries determines the need for organizational integration of individual national enterprises or their groups at the regional, interregional and national levels. The main components of the globalization of light industry in Kazakhstan are:

- expansion of international economic ties in production and sales;
- growing internationalization of factors of modernization development by increasing direct and portfolio foreign investments;
- exchange of knowledge and technology;
- the spread of industry groups with varying degrees of integration in the light industry, the characteristic features of which are the interchangeability and interdependence of business units, their focus on combined information resources, on markets with a high level of consumption.

T.N. Kashitsyna, N.N. Rustamov (2018), speaking about the prospects for the development of light industry, note that ensuring the effective flow of the processes of introduction and commercialization of technologies requires targeted and systemic actions both on the part of state authorities (legislative and executive) and on the part of the private sector.

In these conditions, a new organizational scheme for managing the strategic development of the industry is needed in Kazakhstan's light industry, reflecting the fundamental changes that have occurred in the last decade. A distinctive feature of these changes is the transition from direct government to indirect regulation and the growing role of various forms of partnership between the state and private capital at different levels of government.

The development of the methodology for managing the strategic management of the light industry of the Republic of Kazakhstan will make it possible to most effectively use new and adapt existing methods and mechanisms for managing corporate structures and enterprises, to solve the problems of restructuring both the industry and its individual enterprises.

5. Conclusion

In the course of the study, it was revealed that the mechanism for diversifying the production of industrial enterprises should be understood as a system that determines the order, content and relationship of processes, procedures, elements and methods, organizational support and information flows aimed at implementing the production of new products. that the department of material and technical supply and sales forms data sources, which provide an assessment of the competitiveness of the company's products in comparison with the products of other manufacturers, which will allow the company to identify its capabilities associated with changes in the market situation. Such opportunities can be the introduction of advanced technologies and changes in production

technology based on tracking the main trends in the technological field, as well as the training of qualified personnel.

To ensure financial and economic stability and reduce commercial risks, it is necessary to use modern development strategies and models of interaction with other market participants, which, in turn, requires improved management, mainly based on the priority of the production diversification strategy. Investigating the processes of diversification of production in the light industry of Kazakhstan, the author came to the conclusion that the use of one or another strategy for the development of light industry depends on the state of this industry in a particular region of the country. In this connection, a classification of all regions of the Republic of Kazakhstan was made according to three main indicators of light industry production - the volume of production of textiles (million tenge), clothing (million tenge), leather and related products (million tenge).

A comprehensive study of the development of the light industry of Kazakhstan using cluster analysis, which allows the division of objects into homogeneous groups (clusters) according to a number of characteristics, made it possible to make a number of generalizations and proposals that will contribute to an increase in the efficiency and effectiveness of economic entities of industry. In particular, the assessment of the potential for diversification of light industry production was carried out in order to identify the opportunities available to light industry enterprises to produce different types of products, while ensuring positive, other things being equal, the values of the main financial and economic indicators. Based on the analysis of economic conditions and tendencies in the development of light industry in Kazakhstan, the strengths and weaknesses of the development of the light industry in the regional aspect were identified, the main problems of enterprises in this industry were systematized, and on the basis of these data, cluster analysis was applied, which makes it possible to divide objects into homogeneous groups or clusters based on a number it was revealed that the strategy for the development of light industry should be developed for each cluster separately.

The foundation of such a structure will create conditions for the introduction of advanced technologies and innovative developments into the light industry, actively interacting with business and the market, thereby ensuring the innovative development of the country and increasing the financial stability of economic entities.
Thus, given the historical and current dynamics of the development of light industry, existing and planned measures of state support for the industry, the existing integration (EAEU, WTO), as well as an increase in the innovative activity of enterprises, an increase in the competitiveness of manufactured products and the development of the industry as a whole can be expected. Country is faced with the task of not integrating into the world economy at any cost, but taking a place in it that is adequate to its economic potential.

It should also be noted that the diversification management process should be continuous. In addition to continuity, management should be cyclical, since changes in the market situation and consumer reactions to diversified products of light industry enterprises should be reflected in the planning of their future activities.

HIGHER EDUCATION INSTITUTIONS AND CORPORATE SOCIAL RESPONSIBILITY: TRIPLE BOTTOMLINE AS A CONCEPTUAL FRAMEWORK FOR COMMUNITY DEVELOPMENT

Christiana Kappo-Abidemi [1], Ogujiuba Kanayo [2]

[1,2]School of Development Studies, University of Mpumalanga, South Africa

E-mails: [1]C.Kappo-Abidemi@ump.ac.za; [2]Kanayo.Ogujiuba@ump.ac.za (Corresponding author)

Abstract. Corporate Social Responsibility (CSR) is predicated on three organizational pillars of economic values, social values and environment values known as the "triple bottom-line". This framework refers to an accomplishment of a win-win status quo amongst three units. Stakeholders within the Higher Education Institutions (HEIs) somehow have ways of enforcing organizations to comply with these triple bottom-line. However, profit making is not applicable to a considerable extent in (HEIs) funded by government, but accountability is of paramount importance. On the other hand, HEIs are facing *challenges* induced by labour market dynamics. This article is a based on the triple bottom line conceptual paradigm and reviews CSR and the importance of the paradigm for HEIs in community development for developing countries, using South Africa as a reference point. We relied on existing literature and our analysis suggest that HEIs need to take part in profitable relations with several stakeholders while integrating their visions and purposes into their CSR management agenda. For the reason that the structure of the community is somewhat complex because of diverse personalities with different levels of resource control; adopting CSR would benefit, appropriate integration of community development programmes.. Engagement through CSR will enhance mutual trust, reduce protest and help improve public image of the HEIs. Particular emphasis on HEIs support to economic welfare and social environs would be a value addition to community development.

Keywords: Stakeholders, Community Development, Corporate Social Responsibility, Triple bottom-line

1. Introduction

Development organizations for example, the United Nations, the World Bank and many others views Corporate Social Responsibility (CSR) as a prospective apparatus for generating development (Frynas, 2005). According to the DFID, in following socially accountable practices, the development that will be stimulated by the private sector will be more all encompassing, impartial and poverty dipping (Jenkins and Ogbara, 2008). As the public expectations of CSR endure and increase because of the bigger role Higher Education Institutions (HEIs) are playing in the public sphere, some HEIs are still looking for ways and means to incorporate CSR into their long-term business stratagems in a way that is advantageous to both education and society. Even though it is debated that being socially responsible does not at all times grow the financial bottom line; there are numerous cases of organizations that have remained profitable while applying more socially and environmentally accountable business models. Hence, promoters of CSR believe that in addition to or in the nonexistence of government regulation, CSR may well be an operational way for organizations to amend the negative effects of Foreign Direct Investment (FDI) and aggressively contribute to community development in a sustainable way.

The question of corporate social responsibility (CSR) has been in discourse for a very long time dating to the 1960s. Nonetheless, seminal research from Secchi (2007) and Lee (2008) echoed in Agedelo et al, (2019) show that the connotation of Social Responsibility has been varying in implication and practice. The orthodox view of the issue was narrowly restricted to charity and then moved to the importance on business-society relations. For the most part, this opinion referred to the contributions made by corporations towards resolving social problems. At the beginning of the twentieth century, social performance connected with market performance of corporations. Oliver Sheldon (1923, cited in Bichta, 2003), the proponent of this philosophy nevertheless, was on the side of management to take the creativity in increasing both ethical standards and justice in society through frugality. In doing so, commerce generates prosperity in society and provides improved levels of wellbeing. Consequently, the present-day corporate responsibility is a structure whereby business organizations consider the concerns of society and accept accountability for the effects of their activities on all, including the business environment. This responsibility shows that the organizations have to act in accordance with legislation and of their own accord create enterprises to increase the well-being of their employees. The HEIs are public entities governed autonomously and regarded as social resources (Ketschau, 2017). The educational system all over the world is latent with different challenges; some of the challenges are peculiar to a particular country while others could be generic. Likewise, communities in developing countries rely on the presence of government and non-governmental organizations to provide their needs, which could be healthcare, improved economic activities, employment generation and so on. Mutual understanding amongst stakeholders is achievable through engagement and proper consultation. Reiss in his interview with Rodney Martin, CEO, Voya Financial, a leading company that helps Americans plan and invest, brings forward his interviewee comment, Corporate responsibility comprises key characteristics of a business culture, such as integrity and transparency; diversity, equality; sustainability; governance; and volunteerism, philanthropy amongst others (Reiss, 2017).

CSR is continuous and long-term process guided by organization personal values. Concisely, Nwoba & Michael (2016) described CSR as the strategies adopted by organization to conduct business in an ethical, societal friendly and beneficial manner to community in term of development. CSR is expected to be a collective effort of all stakeholders through engagement and interaction at all levels. This can involve; working in partnership with local communities, developing relationship with employees and customers, social responsible investment and environmental protection and sustainability. Stanislavska, Kvasnicka, Kuralova & Margarisova (2014) also explained CSR as voluntary interaction of the organization with stakeholders. However, in South Africa CSR has been made mandatory to companies in order to be BBBEE and Corporate Governance compliant but it is expected

to be applied in relevant to the situation (Solomon, 2013). Corporate social responsibility is universally significant as the continuing responsibility by corporate organizations to act virtuously and support economic development in-addition to increasing the value of life of the employees and their relatives as well as the local community and society in general (Alzyoud & Bani-Hani, 2015). The ultimate aim of the corporation is not just the success of business but the welfare of the society at large. Similarly, the society also become interested and concerned about the business. Hence, the emphases is on the need to reconcile ethic with business by doing what is right for the survival of the planet and the life it supported. Progressively, corporations are displaying their corporate social responsibility actions, which boost Organizational appearance; this in turn, provokes positive public opinions Pang, et.al 2018). Owing to its market size and potential, the number of contending initiatives in Africa is increasing. In the foods and beverage industry for instance, corporations attract customers through promotional activities such as Advertising and Public Relations. Therefore, how to accomplish and maintain a savory appearance is a significant concern. Shu-Ling Hsu opined that corporations must launch their organizational image to stabilize their market place (Shu-Ling, 2018).

Higher Education Institutions are not completely exonerated from CSR because they are not hundred percent funded by the government despite being an autonomy entity. The activities of the HEIs in anyway are not expected to be detrimental to the society and environment. Bowens (2011) further explained that CSR influences issues such as civil rights, environs, labour, non-discriminatory operating practices, opposing exploitation and consumer protection. International Organization Standardisation 26000 article recommendations on CSR is also centred on the feedback of stakeholders from developing countries, business, government, consumers, labour, non-governmental organizations and others. Thus, the report articulates the views and perception of almost all pertinent parties and businesses. In recent years South African higher educational institutions have been faced with so many challenge such as induced from poverty amongst certain racial groups that lead to quest for free education, decolonisation of education, massification of education and politicalising of education (Kekana & Kubheka, 2016; Mabelebele, 2015). Public HEIs in South Africa is funded via government grants (50%), student tuition fees (25%) and other private income (25%) (DHET, 2004; de Beer, Jacobs, Moolman & Zaaiman, 2016). Some institution also have a way of generating income internally. Despite the enormous dependent on public funding, HEIs are also expected to abide by the provision of King IV report, whereby 'triple bottom line' baseline for measuring organizational performance is adopted (van der Walt, 2013). Historically, South African education system has not been receptive to people of coloured (Ramdass, 2009). At the dawn of democracy, various policies and laws were enacted for an all-inclusive relationship in every sphere of the society. In as much as the new democratic policies has opened the door of learning, the system is still been haunted by the ghost from the past (DHET, 2010; Badat, 2010). In South Africa, HEIs has been subjected to pressures such as fees must fall in the recent time. The mandate has pressurised the government to provide free education for all in South Africa in such a way that the HEIs has been in turmoil in the last 5 years. The demand of students for free education seems unending and the department is struggling to meet up with all of it (Masweneng, 2017). In addition, employees through their unions have also had expectations such as converting all temporary/contract non-skilled employees into permanent position, which sometimes end up in deadlock. HEIs do experience infrastructural challenges due to student influx, which requires government intervention. Host communities of HEIs have also to endure the protests and unrest that accompanied the demands of these internal stakeholders.

Nonetheless, interested party identification and administration is reasonably well understood in the literature for private sector organizations (Christopher, Payne, & Ballantyne, 2002, Rutterford, Upton, & Kodwani, 2006), and its importance is rising through all developing and developed countries (Maassen 2000, Wit, & Verhoeven, 2000, Peters 1996, Kettle 2002, Fasoulis, & Kurl, 2018; Girdzijauskaite, Radzeviciene, & Jakubavicius, 2019). In contrast, where stakeholder theory has grown in commercial arenas (Donaldson, & Preston, 1995), there are fewer studies in the public and not for profit areas (Bryson 2004), typically with respect to higher education institutions.

Higher Education Institutions (HEIs) represent a vital body part of any society. These institutions are facing new challenges that impose the need to be independent to a reasonable extent from governmental and state support. The South African changing environment in which HEIs function and the challenges that higher education face comprise mass increase of higher education; reduction of state expenditure and support; diversification of financial resources; internationalization; commercialization; changes brought by technology development, the adaptation of core curriculum to accommodate and capitalize on labour market requirements. These changes, no doubt have affectedthe quality of education, HEI autonomy, academic freedom and responsibilities towards society. Thus, HEIs are are moving toward corporatization which calls for them to be a good corporate citizen and the best approach for them to achieve that is by adjusting to the model of Social Responsibility. This article focuses on the necessity for higher education institutions to demonstrate responsible corporate citizenship to their diverse stakeholders, within the context of a developing country epitomized by South Africa. Hence, we focused on the level of engagement the stakeholders should expect as well as determine the role of HEIs in CSR for sustainable community development.

Theoretical Framework

Our paper is predicated on the stakeholder theory as propounded in 1948 by Edward Freeman. The principle postulates that organizations owe answerability as well as responsibility to extensive variety of stakeholders, other than just shareholders. These interested parties represents to all who affect or are influenced by organizations' actions. Astrie, Gatot and Yuni 2014 did hypothesize that these interested parties encompasses investors, suppliers, customers, employees, government, community and the environment. The key proposition of the philosophy is that organizations owe corporate accountability to broad range of stakeholders' interest. It considers an organization as an interconnected web of varied interests. According to Lin, the stakeholder theory is a theory of organizational management and business ethics that accounts for multiple constituencies impacted by business entities like employees, suppliers, local communities, creditors, and others. It asserts that managers must satisfy a variety of constituents who can influence the firm's outcomes and addresses morals and values in managing an organization, such as those related to corporate social responsibility, market economy, and social contract theory (Lin, 2018). The proponents accepted this theory as one of the schemes in humanizing the organization of firms' social responsible behaviour. The foundation for adopting this theory for this paper is that the discourse is around the framework of organizations' social responsibility schedule to generate development within its host community ultimately.

2. Triple Bottom Line Framework

The triple bottom line (TBL) is a concept that inspires organizations' pledge on social and environmental apprehensions just as they do on income flows. The TBL theorizes that as an alternative of one bottom line, there ought to be three: people, profit and the planet. This framework measures an organizations level of obligation to corporate social accountability and its impact on the environment in due course. A renowned British Management professional (John Elkington) in 1994, created the slogan "triple bottom line" as his way of gauging performance in corporate America. The principle behind the TBL was that organizational goals could be achieved in a way that not only profits is considered, but also people's lives are advanced and the planet protected. In corporate finance, when we refer to a firms' bottom line, we usually mean its profits and this is line with tradition, where corporate leaders concern themselves with the bottom line (monetary profits their businesses makes). However, Elkington's TBL framework supports the goal of sustainability in business practices, where organizations move outside profits to include social and environmental concerns to gauge the complete cost of doing business.. The TBL framework increases the old-style bookkeeping structure to encompass additional

performance areas: the social and environmental influences of organizations. These three fundamental dimensions are denoted as the three P's: people, planet, and profit (Figure 1).

Figure 1: Triple Bottom Framework
Source: Authors

People refers to employees, the labor involved in a corporation's work, and the wider community where the firm operates. The importance is on how much an establishment supports the society. A triple bottom line organization pays a reasonable wage and ensures a good working condition at all units. Triple bottom line organization make an effort to give back to the community. This ingenuity is an example of "enlightened self-interest". The planet element of the triple bottom line specifies that corporations must decrease their environmental footprints as much as possible. These determinations should embrace financing renewable energy, managing natural resources efficiently, and improving the reduction of waste. Nevertheless, though every organization pursues profitability (financials), organizations embedded in the triple bottom line see it as part of a business plan. Therefore, sustainable organizations have acknowledged that profit is not entirely conflicting with people or the environment. TBL theory posits that businesses should be operating concurrently on the three bottom lines: People, Planet and Environmental Responsibility. Profit, is referred to the traditional corporate profit, the people measures how socially accountable an organization has been throughout its tasks, while the Planet measures how ecologically accountable an organization has been. By focusing on these three interconnected essentials, triple-bottom-line reporting can be a vital tool to supporting a firm's sustainability goals. Moreover, the TBL hypothesizes that if an organization highlights only finances and does not investigate how it interconnects socially, that organization cannot see the whole picture, and thus cannot account for the full cost of doing business.

Despite the fact, the triple bottom line has been in the dialogue for more than two decade, events such as the 2008 financial watershed, the British Petroleum oil spill, and climate variation discussions have continuously, casted spotlights on organization's ethics and their corporate social responsibilities. A more recent research at MIT found that establishments that treated sustainability with due recognition by making a business case for it with tangible goals were the ones that benefitted from sustainable activities. The achievement and practicality of business sustainability innovations is reliant on a gifted member of staff who knows how to take the triple bottom line from theory to reality. This worker must have a precise understanding of ecological science, bookkeeping, and economics. In addition, governance skills and the capacity to use systems thinking to make tactical corporate judgements are also significant for the employee.

3. Review of the Legal Framework for Coporate Social Responsibility in South Africa

Coporate Social Responsibility (CSR) is not merely a recurrent theme for discussion and argument in South Africa, but also a noticeable effort by most establishments. The social image of South Africa after the Apartheid period was one of obvious dissimilarities as per education, substructure, financial power, and access to basic services. The democratic administrations that have administered the country from 1994 have made significant efforts in contending with obvious social inequities through diverse social agendas and several public initiatives, in-addition to the gravitas given to the private sector. Even though the South African Companies Act 61 of 1973 does not indulge businesses to participate in CSR ventures, the policy document of the country and the King II and King III reports clearly support the need and significance for businesses to recognize all interested parties and to embrace a "triple-bottom line" approach (*Dekker and Esser 2008)*. Specifically, the King reports, focuses on social, environmental and economic concerns, which constituted accepted guides of finest practices in corporate governance in South Africa.The clauses in the reports are not compulsory, but they take a "comply/apply or explain" method that to some extent forces businesses to apply CSR programs or rationalize why they have not implemented them (*Sustainability SA)*.

Nonetheless, according to existing studies, not all CSR initiatives in South Africa result from voluntary or indirect business resolutions. Most of them are the creation of corporate acquiescence with the Black Economic Empowerment (BEE) legislation (*Sustainability SA)*. The BEE Act mandates South African-based businesses to consider all stakeholders when carrying out their internal and external processes in an effort to eliminate societal and economic imbalances inherited from Apartheid era and support previously discriminated groups to enthusiastically play a part in the country's economy. Corporations that refuse to comply with the BEE scorecard are given negative ratings, therefore complicating their capability to operate in the country. At the end, BEE is not entirely planned to address racial inequities; it also tries to fortify the socioeconomic spectrum of the country for parity and fairness. Even though large multinational corporations are the ones that are more dynamic with CSR, more and more businesses from many sectors and of diverse sizes are begining to demonstrate interest in social responsible policies not only because of global rising trends and external pressures, but also because it can lead to efficiency gains. Porter and Kramer (2011) posit that solving societal worries may well increase the levels of company output, with the ensuing positive effects in profitability and shared values

The King Reports – the "Codex" of South African CSR
Corporate governance guidelines and standards in South Africa are entrenched in the well-known King reports (*SAICA)*. Even though they are not approved legal documents; they are viewed as contemporary guiding principles on good corporate governance and its adoption is recommended in the country's business sphere. In 1994, the King Committee on Corporate Governance delivered the first report, King Report 1994, intended to stimulate corporate governance and satisfactory standards for board of directors of listed companies, financial institutions and some public enterprises. Although encouraging decent governance practices, the report also put emphasis on the need for corporations to be socially accountable in the areas and communities in which they operate. In 2002, the King II report on Corporate Governance was published. Relatively at the same time, the Johannesburg Stock Exchange (JSE) demanded listed companies to conform with the King report or else, explain why they were not following to the norm. The second document clearly established and explained the seven good corporate governance fundamentals that any corporation embracing the report should pay attention to: accountability, discipline, fairness, independence, responsibility, social responsibility and transparency. The revised third issue of South Africa's Code of and Report on Governance Principles (King III report) was made operative in March 2010. With respect to the earlier versions, the

new report emphases sustainability and risk issues, while continuing to highpoint the significance for companies to respond to all stakeholders. The areas covered in the report are the governance of risk, the governance of information technology, compliance with laws, rules, ethical leadership and corporate citizenship, boards and directors andaudit committees. Others include codes and standards, internal audit, governing stakeholder relationships and cohesive reporting and disclosure. Indirect regulatory actions, like the groundwork and dissemination of the previously mentioned documents, can without a doubt help stimulate CSR initiatives in diverse industries. That is also the case of the launch and growth of the Johannesburg Stock Exchange Social Responsibility Index (JSE SRI) in 2004. The SRI apprises financiers and market go-betweens about corporate sustainability policies and practices of listed companies, encouraging investors to support "friendly" companies, and pushing corporations to strengthen their environmental, social and governance enterprises. Responsible investment is a comparatively new concept (the Dow Jones Sustainability Indexes were introduced in 1999 and the FTSE4 Good Index Series was launched in 2001), especially in emerging markets where South Africa was the first one in launching a sustainability index, followed by Brazil in 2005 (BM&F Bovespa) (*Accountancy SA 2001).* According to King IV Report (2016) the organization values statements, usually state how all stakeholder both internal and external will be treated, the purpose and objectives of the organization, expectations of how work is done and how stakeholders should behave (IODSA, 2016). These values are expected to reflect in organization vision and mission statements and addresses the ultimate aims of CSR. Ethical issues are also one of the major concerns of CSR.

4. Stakeholders In HEIs and Corporate Social Responsibility

Freeman (1984) posits that an interested party may be any individual or group of individuals either impacted upon by the corporation or able to influence on the attainment of its goals. This is the conception behind Stakeholder Theory. The theory cogitates that the consequences of any activity should take into consideration the benefits for all interested parties involved and not only those of the shareholders. Within the context of public and not for profit organizations, Bryson (2004) in reaction to the Eden and Ackerman of 1998, identified interested parties as individuals that have the power to firmly effect, the future of the organization. Furthermore, Jongbloed et al. (2007) joined the debated and pointed out that the acceptability of higher education to the public is gauged continually by the dimension and prominence of the HEIs obligation to its community of stakeholders, which is essentially of superior depth than any modest maintenance of contacts. It realistically portends that the organization seeks out and embraces ways of including the stakeholders to best perceive how the latter, value the services provided and just how they will advance. Benneworth and Arbo (2006), argue that a plausible importance from the above discourse is that these demands will induce a new method to governance and social accountability, improved professional management and a reassessing of the university business models for developing countries. Jongbloed et al., (2007) inclined that the stakeholder theory is outstandingly valuable to HEIs in describing the attention provided to the many groups found in its environment additionally to the relational interface between HEIs and its communities. Nevertheless, amongst developing countries, South Africa inclusive, HEIs are yet to prove their competence to fittingly identify the stakeholders working with the institution as well as establish the needs of each entity and the level of prominence to accord to each relationship. However, for HEIs in the developing countries to meet stakeholder needs, much has to be done.

HEIs in South Africa have four basic pillars for assessing performance, which are teaching, and learning, research and scholarship, engagement and leadership, administration and management. Alzyoud & Bani-Hani (2015) explained that CSR could be achieved through all of these university core businesses. The South African department of higher education (DHET) in its value statement prioritised the need to address society problem through education and training, complied with the constitutional mandate of right to education and acknowledge

the need to work with all partners to achieve their goals. Furthermore, DHET value statements will help the stakeholders to know if the HEIs are keeping to their promises or not (Dubbink, Craafland & Liedekerke, 2014)

The implementation of CSR by the HEIs supposed to be the joint effort of the stakeholders within and outside the institutions (Bowen, 2011). Nonetheless, it is expected that individual institution may adopt a framework of values, mission and vision from the generic provision of the DHET. However, this is not an innovative approach to CSR, because as clearly mentioned in ISO 26000 document, there are lot of unidentified stakeholders in each organization. The onus thus lies on individual organization to identify people affected by their operations, their concerns and methods of engagement. Consequently, seven ideologies of social responsibility has been identified by Bowens (2011) as accountability, transparency, moral behaviour, reverence for stakeholder interests, reverence for international rules of behaviour and reverence for human rights. These values must be integrated in HEIs community development approaches

Stakeholders are described as the group of individuals that are interested in the business of the organization, these individual can be affected by the outcomes of the organization objectives and decisions (Khanyile, 2018). In order to determine the stakeholders in HEIs, it is recommended that the purpose and objectives of the institution as well as management responsibility towards the stakeholders should be identified. Stakeholders in South African higher education institutions involve both internal and external individuals that have stakes in the activities of the university and are affected by these activities. The internal stakeholders are clearly identified as students, government, staff (academics and administrative staff). The external stakeholders are a bit ambiguous and can only be defined according to various institutional plan within the provision of DHET. However, external stakeholders are identified as graduate students, employers of graduates, funding agencies and society (Stanislavska, *et al*, 2014: Badat, 2010; Vasilescu *et al*, 2010: Chen, Nasongkhla & Donaldson, 2015). The stakeholder theory further explain that the corporation activities have the right and obligation to participate in directing it (Brusseau, 2012) affects whoever's life. As such, the HEIs are expected to pursue and embrace their ideologies and principles: even-handedness, excellence, development, democratization, academic liberty, institutional sovereignty, effectiveness, efficiency, and public accountability in the interest of all (DBSA, 2010).

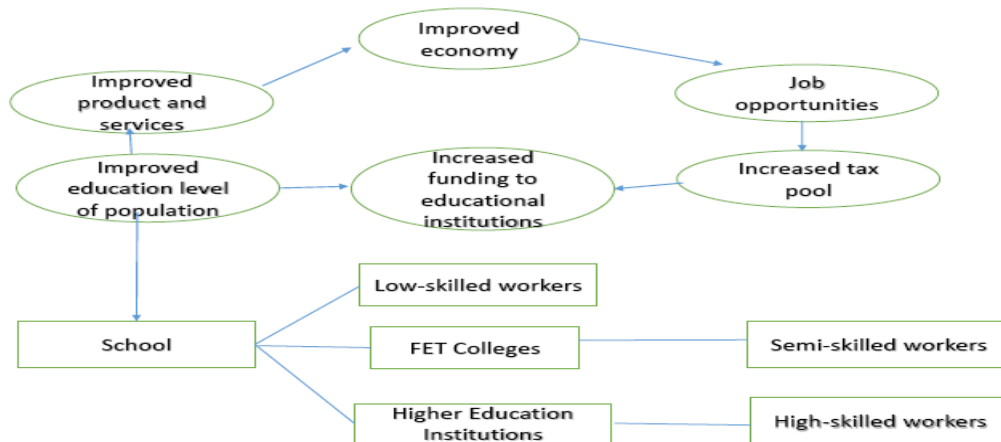
Corporate Social Responsibility of Higher Education Institutions
Corporate Social Responsibility is not just limited to philanthropic responsibility, of the business, also, economic responsibility, legal responsibility as well as ethical responsibility were all considered as holistic approach to CSR (Brusseau, 2012; Vasilescu, Barna, Epure & Baicu, 2010). The CSR is globally underlined with come certain principles which can be compared with the values and principle set for HEIs in South Africa and establish the possibility of pursuing social responsibility within the community by universities despite been a public entity with autonomy power. Actually, education is regarded as one of the most powerful tool needed for the pursuit of the agenda of CSR by linking economic, societal and environmental to sustainable development strategy for national improvement (Chen, Nasongkhla & Donaldson, 2019). Further, Sham (2018) posits that "destroying any nation does not require the use of atomic bombs or the use of long range missiles. It only requires lowering the quality education and allowing cheating in the examination by students". This will destroy the entire governance system because it will be populated by mediocrities produced from such education system. This position is also in tandem with Rahman et al (2019). The impact of HEIs is illustrated in below figure 2:


Figure 2: Illustration of HEIs impact on economy
Source: Adapted from (de Beer, Jacobs. Moolman & Zaaiman, 2016)

In line with the principles of CSR and the highlighted impacts of HEIs, below discussions is going to examine the relationship between the principles and how they impact on the university communities.

a. *Corporate social responsibility accountability and HEIs*

The objective of this principle is to ensure that corporate decision is taken in such a way that both organization and stakeholder's interest are put into consideration without having to deceive any of the parties (Jones, 2010). Accountability is usually described based on the context in which it is been used, however, in the context of CSR, triple bottom-line is regarded as the appropriate measure for corporation accountability. Whereby, an organization are expected to keep proper records of their economic, social and environmental activities (Brusseau, 2012; Mosunova, 2014; Yamamoto, 2011). In the past, business were only accountable to the shareholders, as time goes by the role changed and all stakeholders are entitled to reports, not just on finances but other activities of the organization that impacted on stakeholders. Yamamoto (2011) acknowledged that the merging of autonomy power and accountability granted HEIs has somehow subjected its operation to performance based funding. The performance are measured in term of graduate throughput and research articles published in accredited journals (Mohamed, 2015) and how these has impact on relevant stakeholders. HEIs are not excluded from being accountable to their stakeholders despite been a public entity. In the last four years South Africa Higher institution has been facing various challenges in term of undergraduate funding which was titled #feesmustfall. In a study done by (Inglesi-Lotz & Bohlmann, 2016) explained the ripple effect of fees must fall protest on the economy and labour marker. The analysis in the study showed that there might about 90% reduction in new skill labour entering into the market. This challenge has brought on board more stakeholders into limelight. HEIs has been forced to engage more with government, business, parent, and student formations to discuss way forward (Masweneng, 2017). In addition, the presence of universities in communities has brought about changes in social, economic and environmental structure of such communities due to influx of young people for learning purpose. University students do have a way of affecting the social dynamics of their host community either positively or negatively depending on individual perception of their presence (Moolman & Jacobs, 2018). Likewise, since universities are funded by taxpayer's money, hence, there is a serious need for an ongoing updates on their various activities on

regular basis especially the ones mandated by law such as demographic representation of workforce and given preference to deserving black learners. Actually, Mohamed (2015), suggested that responsibility is equal to accountability as per HEIs and its CSR operations

b. *Corporate social responsibility transparency and HEIs*

Despite the acclaimed academic freedom of HEIs, transparency and credibility is key to the appropriate management of its affairs. Right from inception universities has always been part of their host communities, and always seen and treated as one of the community entity (Die Arbeitgeber, 2009). Transparency with regard to CSR means disclosure of all relevant business information to stakeholder and ensure the business is devoid of corruption in any form. This could enhance the trust of employees, clients, community and other relevant stakeholders in the case of HEIs. The trust will establish the basis on which the stakeholder's conflict can be resolved amicably and successfully, attract and retain the best brain and promote the existing relationship in the right direction (Aggeri & Breton, 2016). According to (Vasilescu *et al*, 2010) stakeholders demand and expected increasing standard of accountability and transparency at all time. According to (Nwete, 2007) CSR is described as the obligation of business to support economic development in a sustainable manner, in partnership with employees and their families, local community and society in general to progress quality of life that supports the business and good for development.

c. *Corporate social responsibility ethical behaviour and HEIs*

Business ethics is a "form of applied ethics or professional ethics that examines the ethical principles and ethical problems which arise in a business environment" (Wlodzimierz and Szanto, 2018). Mohamed (2015) described corporate social responsibility in academics/university environment as social responsibility, which is showed as the policy of ethical quality of performance of the university community through accountable management to generate Sustainable Human Development. Vasilescu *et al*, 2010, has suggested numerous CSR effects of the HEIs, which are organizational, cognitive, social and educational effects. In support of this framework, Mcuddy, Anstett & Guest (n.d) designated ethical behaviour as what is accepted as good and right in the perspective of the governing moral code. Sometimes some things that seems legal may not be morally right. Hence, ethical behaviour is about striking a balance between legal and moral justifications. Unethical behaviours in HEIs can impact negatively on the thinking and moral of future leaders (Singh & Stuckelberger, 2017). Student that learned in the course of their study that situation can be manipulated to suit their own expected purpose will definitely cheat their way through in business after graduating from higher institution of learning. Hence, the need to instil ethical behaviour into learners is one way of HEIs involving in corporate social responsibility (Chen, Nasongkhla & Donaldson, 2015; Tormo-Carbo, Oltra, Segui-Mas & Klimkiewicz, 2016; Singh & Stuckelberger, 2017)). The HEIs itself has to have high ethical culture in how it relates with stakeholders just like other business organization, there is need to comply with recordkeeping and report on its activities as it impacts on society and environment. Ike (2017) acknowledged that education does not happen in isolation but through societal, environmental and human influences. Educational institutions should revisit their curriculum and engage in teaching, research and training that challenges the entire conscience of human.

There are various ethical issues in HEIs that can negatively impact on Corporate Social Responsibility all over the world and South Africa included. Collapse of multinational companies earlier in 21st century has raised a lot of questions and integrity on academic institutions that produced the likes of managers that were involved in corruption stories that surrounded the collapse of those companies (Stuckelberger, 2017). Likewise, in South Africa, student funding through NSFAS over the years has been characterised by lots of hiccups that created students unrest and protest. Administrators has been accused of malpractices. Communities has been place on

siege sometimes due to student unrest, life and business of the community has also been threatened in the course of the protest. The DHET policy on throughput of graduate has put educators under unnecessary pressure to increase the pass rate. In some cases underserving students marks are upgraded in other to meet the expected passed rate or the quality of the assessment questions and criteria are reduced to increase the pass rate (Jacobs & Moolman, 2018).

d. Stakeholders Interest and Corporate Social Responsibility

Stakeholders are basically categorised into two namely: primary and secondary stakeholders. The primary stakeholders have direct interest on the organization performance and manners in which the organization have conducted business. Meanwhile, the secondary stakeholders are indirectly affected by the organization through their actions (Saylor Foundation, n.d). Stakeholders might be a source of new ideas, innovations and opportunities for organization growth and development. However, the stakeholder interest concept of CSR was born out of the fact that any activities of an organization that endanger the live or property of others must have a dare consequence on the organization (Nikolova & Arsic, 2017). According to Kettune (2014), quality assurance document of the institutions must describe the level of interactions and relationships with all stakeholders in HEIs, especially the external stakeholders. The terms and conditions of engagement and involvement of stakeholders in HEIs affairs should be clearly stated in policy document. In addition, HEIs could collaborate with more stakeholders in order to generate funds for the administration of the institution. Stakeholders are not just people that contributed to the organization in one form or the other; people affected by the activities of the organizations are also regarded as stakeholders. For instance, in the case of HEIs, always a government gazette precede the establishment of HEIs in any community. In this document people that were likely to be involved and affected by the affairs of the institution are usually mentioned and mode of engagements with them.

5. Community Development Via CSR: Role of HEIs

The days when the government was seen as the exclusive social change agent and the total macro problem solver have become an obsolete thinking, as organizations are increasingly taking a larger role, actively contributing in social and community projects under the concept of Corporate Social Responsibility (CSR). The featuring part of HEIs CSR in Community Development (CD) used in this paper is every primary and secondary benefits received by the community because of social obligation of the HEIs to the general community and social system. In accordance with the espoused principles as stated by Bowens (2011), we signpost the collective roles of HEIs CSR in CD for developing countries:

a. Closer links between HEIs and Communities. Via CSR, the presence of HEI in the social structure is felt beyond the realm that HEI is a structure for job creation and production of services only. This felt social capital in the society is consequently essential for community development; thus, HEIs and host societies stays in perpetual concord.

b. Growing talents. HEIs with a progressive approach towards CSR can profit from their position and fortify their posture as an attractive establishment by making their guarantee part of their value proposition for would-be employees. Research has confirmed that when employees view their organization's commitment to socially answerable behaviour more favourably, they correspondingly gravitate to have attitudes that are more constructive in many other areas that associate with better performance. They have confidence in their organizations, to make out, recompense great service, and resolve apprehensions quickly. A stout confidence in senior administration as per CSRs, results to improved opinion of employees to HEIs, hereafter their persuasion and devotion to the sector. This is vital in acquiring and retaining skilful

employees in the HEIs. In relation to Community Development, HEIs personnel views would possibly result to a community that treats the HEI as a vital economic base in the society.

c.   *Transfer of Technology (TOT).* Closer ties help in TOT between host communities and HEIs. Barton (2007) posits that there are three mechanisms of technology transmission: the flow of human resources; the flow of public technology support; and the flow of private technology to host communities. TOT introduced by HEIs that is rooted in the CSR processes, would profit the targeted communities in many facets of their development.

d.   *Interdependency between Communities and HEI:* The close linkage observed between a HEI and community is a distinctive of CSR role in community development as it produces progress that is sustainable in the end. HEIs CSR ventures give backings to local organization and disadvantaged communities. This without reluctance leads community development in a sustainable manner.

e.   *Poverty Alleviation:* HEIs program may well focus on the underprivileged, helpless and susceptible groups in the communities they function. Via this partnership, they may perhaps galvanize other organizations to help the host communities in its struggle to lessen poverty and, henceforth, in developing the communities.

f.   *Information Coordination Function:* HEIs should produce evidence-based research and start developments that are paramount to their host communities with references from such research. For example, extra-large Information Tech companies in the United States assisted under-staffed police departments with information gathering and processing by connecting cameras with video processing capabilities in spaces where the crime rates were becoming very high (CSR@Intel, 2009). This is an instance of how technology companies implement CSR ingenuities, which correspondingly profit the community and support their business goals.

6. Conclusion

Previous literature have not investigated in detail how CSR should be focused towards skills and uplifting of previously disadvantaged persons in the South African Society. The COVID-19 pandemic have therefore presented a new vista for exploration as per the the workings of HEIs during this uncertainty. Furthermore, extant studies are silent on how operating doctrines that support development should be embedded int the CSR framework.

The general roles of corporate social responsibility (CSR) in community development revolve around the ways their responsibility is acknowledged by community of stakeholders and how they feel positive impacts. CSR have many functions, which are positive and they bring the effects of their actions to the community. For many HEI leaders, it is a challenge mostimes to know where their accountability should begin and end with reference to developing infrastructure, generating economic prospects, and giving access to core services. Nevertheless, experience has shown that long-lasting CSR solutions at any operational level are predicated on collaborations' amongst government, civil society and business. However, it should be noted that profits do matter in the triple bottom line, but not at the cost of social and environmental worries. Conversely, there can be dire costs of ignoring the TBL framework in the name of profits. A key challenge of the TBL, according to Elkington, is the challenge of evaluating the social and environmental bottom lines. Profit is fundamentally numerical, so it is easy to measure, but what constitutes social and environmental responsibility is to a certain degree subjective, which makes the evaluation difficult. For example, would a dollar measure the quantum of oil? Additionally, there is the concern of mingling varied elements. It is also problematic to change levers amongst priorities that are seemingly varied, make the most of financial returns while also doing the maximum good for society. Some establishments might struggle to balance deploying money and other resources, to all three bottom lines short of favouring one at

the expense of another. Most corporate social responsibility projects will not deliver an instant boost to HEIs financial performance, but implemented honestly and leveraged skilfully, they can bring positive publicity, enhance corporate reputation, and expand stakeholder engagement. This is in addition to giving HEIs, the contentment of knowing they have truly supported community development. The lack of transparency, neglection of the main business stakeholder and not introduction of criteria relative to the CSR outcome are key impediments to CSR in South Africa and most of developing countries that must be giving attention for progress in community development.

CSR of HEIs in most developing countries including South Africa differ because of context. Thus, this article posits that similar research should be steered on the discrepancies between methods implemented by HEIs in terms of emphases and configurations in Corporate Social Responsibility, the precise roles of Corporate Social Responsibility agendas to community and society. Specifically, the following recommendations are proffered:

1) The Corporate Social Responsibility of tertiary institutions, especially in South Africa should tend towards, skills and educational development of historically disadvantage people, creating employment opportunity for reasonable number of people within the local community.
2) Research focused on the workings of HEIs during the prevailing pandemic (COVID 19) and economic uncertainties would be invaluable. Nonetheless, HEIs should upbeat and acknowledge that moving to a balance of their financial books should not be at the expense of social goals that have obligation in keeping.
3) Change is a continuum and the HEIs globally are going through this process. Therefore, their responsibilities of learning and inquiries necessities a re-examination, with a view on the influence they make to the prosperity of their economic and social environs. Further, it is imperative that Educational programmes in emerging and developing countries should be organized in such a way that community wants will be met.
4) HEIs need to take part in cost-effective associations with several stakeholders and integrating their corresponding ideas and resolutions into their own management practices. Hence, HEIs need to make out these stakeholders and their desires before charting out priorities.
5) HEIs are encouraged to develop calculated trends and operating doctrines that guarantee sustainable performance and development. In such a process, the information learnt from the stakeholders and resultant inventions will allow the HEI to increase its performance in a way that will be sustainable in the long term. This will profit and add value, not only the institution, but also the stakeholders and society in general.

RESEARCH ON THE EFFECT FACTORS OF TECHNICAL PERFORMANCE ON SMEs BY INDUSTRIAL SECTORS*

Seok-Soo Kim

Graduate School of Knowledge Service Consulting, Hansung University, P. O. Box 136-792, 16th Street, Samseonggyo-ro, Seongbuk-gu, Seoul, Korea

E-mail: ssjm4475@gmail.com

Abstract. This study's research question is that there will be a crucial element in improving business performance among SMEs' success variables and competencies. Significantly, there should be different variables for performance in industry sectors. 1) The success variables of SMEs vary widely, but four characteristics of technology, management, commercialization, and exit strategies were selected. 2) The mediator is a technology innovation and technology marketing function. 3) The dependent variables are technical, financial, and non-financial performance. Previous literature had problems studying only the effects of each of the three variables, so we established a hypothesis and research model that focused on causality studies linking them. According to the data group analysis result for 3330 CEOs of SMEs, the six industries' performance impact factors were different. As a result of comparative analysis of changes in performance impact by industry, it was found that the largest increase in Information Technology (IT)/Software (S/W), Life/Food, and Crafts sectors. The key research finding is that it has verified the essential elements of critical performance improvement. We provided that different success variables and competencies differ in performance across industries. The results are expected to contribute to SMEs' CEO and government policymakers' practical applications, support organizations, academia, and industry.
.

Keywords: entrepreneurial performance; entrepreneurial competency; SMEs; technical performance; effet factor; technology commercialization

---

1. Introduction

This study examined the concepts of entrepreneurs' success variables and entrepreneurs' competencies that can enhance technology-based SMEs' business success to revitalize the technology-based entrepreneurship ecosystem. Besides, by analyzing the impact and analyzing the impacts' characteristics, we verified the impacts of the success factors on the entrepreneurial competency and identified the correlations. To achieve this goal, we reviewed the problems and limitations of previous studies through literature review and then explored the factors to derive, analyze, and evaluate the core factors. Theoretical research systematically analyzed previous studies related to the Technical Performance and influential factors of technology start-up companies that have been studied in Korea and abroad. In particular, this study examined the effects of technology start-up companies' success variables on the technology marketing capability and technology innovation capacity, which are the mediating effects of technology startup capability. Also, we verified the impact of the technology startup success variables on the business performance of technology startup companies, set up a research model, and performed research on the effects through Smart PLS.

The survey subjects were 330 start-up companies' CEO and conducted online surveys in six industries, types of manufacturing, and gender, and 205 questionnaires were collected and used for empirical analysis. For statistical analysis, SPSS 22 was used for basic statistical analysis. The results were presented using Smart PLS3.2.9 for evaluation and significance evaluation of the research model's measurement and structural models. We Investigated the components of entrepreneurs' ability to perform entrepreneurship under poor entrepreneurship conditions and evaluated their influence to improve their ability and capacity for success of start-ups based on the characteristics of the entrepreneurs' capabilities and the conditions of their establishment. Creating and expanding business performances by linking core competencies and starting a business to successful start-ups is an important task.

We reviewed previous studies to identify problems and limitations and select variables. Success variables have been studied in various ways. However, in this study, technology, management, commercialization, and exit strategies have been selected because they are essential success variables for companies. The mediation variables are SMEs' technology marketing competency and technology innovation competency, which affect performance and verify the mediating effect on performance. The dependent variables are financial performance, non-financial performance, and Technical Performance, which are indicators of performance. The objectives of this study are as follows. First, the causal relationship between the success variables of SMEs on competence and performance. Second, the effect of success variables on performance through the mediating effect of competency. Third, the effect of competency on performance. Fourth, the effect on the performance of six industries including electrics/electronics, machinery/parts, IT/SW, chemicals/textiles/materials, life/food, crafts/others. The reason for selecting six industrial classifications is that, since 2001, the Korea Startup Promotion Agency has been operating a business support policy by designating six industrial classifications of small and medium-sized startups.

2. Theoretical background

Previous research on technology-based SMEs: Technology-based startups and ventures already play a significant role in developing the national economy and serve as a growth engine for industrial innovation (Autio 1997; Kortum and Lerner 2001). A company focused on R and D or using new technical knowledge or knowledge (Cooper, Williard and Woo 1986). In Korea, it is classified into technology-based startups, ventures, and general startups according to the type of startup of the Small and Medium Business Administration and the Korea Startup Association. Small and medium-sized startup companies are identified as new technology-based companies that

have just been established. Within seven years, which mainly corresponds to the manufacturing and knowledge service industry, the Small and Medium Business Startup Support Act defines a company within seven years after its establishment as a startup company. In a similar sense, it means a new SME that is technology-intensive as a venture company. It is also recognized as a result of high-tech or new technology-based startups with high risk and high-profit potential. However, the definition is similar because the distinction is not clear. Examples include spin-offs, technology-based spin-offs, new technology-based companies, research-based ventures, and high-tech startups (De Cleyn and Braet 2009). In another respect, research-based startups are defined as new business startups that develop and sell new products or services based on proprietary technologies, and research, development, innovation, exports, and employment. In this regard, small and medium-sized startups have contributed to the economy and have played a key role in bringing new technologies to the market (Heirman and Clarysse 2004). A small and medium-sized start-up company means a start-up based on the entrepreneur's skills, experience, and expertise, and is also called a start-up technology. The United States recognizes that technology-based start-ups are accompanied by personal and collective assets associated with advances in scientific and technical knowledge to create and maintain value (Bailetti 2012).

In Korea, as of April 2019, according to the 2018 Entrepreneurship Research Results Report, there were 2,030,987 small and medium-sized startups. The organization type was 89.0% for individual entrepreneurs and 11.0% for corporate entrepreneurs. The distribution of organizational form by industry was high for individual entrepreneurs from 1st to 7th year. Corporate entrepreneurs were found to maintain similar levels at around 10%. The start-ups in one year accounted for the largest portion with 24.3%, followed by 20.6% in 2 years, 16.0% in 3 years, 12.6% in 4 years, 10.2% in 5 years, 8.8% in 6 years, and 7.5% in 7 years. In terms of 18 major categories, 26.5% of the wholesale and retail industries were the highest, followed by 25.8% of the lodging and restaurant industry, 8.9% of the manufacturing industry, and 7.8% of repair and other personal service industries (Start-up Promotion Agency 2019).

The results of researching previous studies on the performance of SMEs can be summarized as follows. The effect of management ability on financial performance was studied (Kim and Seo 2017). The effects on technology competency, Technical Performance, and management performance were also studied (Lee I.K 2016). However, the previous studies were limited to each of the influence variables. Also, only the success variable's management performance was studied in part, and there was no study on the mediating effect of SMEs' competency. Overall, the previous study was only to identify success variables for management performance and individual relationships of competencies. Therefore, some problems and limitations cannot determine the causal or dynamic relationship between variables.

The specific purpose of this study is as follows. First, the causal relationship examined empirically, the effects of the technology startup success variables on capability, and the Technical Performance of technology startup companies. Second, this study empirically analyzed the effect of the technology startup success variables on technology performance through the mediating effect of technology startup capability. Third, we empirically identified the effect of technology entrepreneurship capability on technology start-up companies' Technical Performance. Fourth, empirically analyzed the influence factors of technology startup success variables on technology performance by using Partial Least Square-Structural Equation Modeling (PLS-SEM), a statistical analysis technique, and causal relationship. Fifth, identified the impact factors affect business performance in six industries such as electrics/electronics, machinery/parts, IT /SW, chemicals/textiles/materials, life/food, crafts, and other industries. The moderating effect of differences performance was confirmed using Data Group Analysis.

This study's differences are summarized as follows: 1) The success variable, an independent variable, was selected as four sub-factors. Management performance, a dependent variable, was selected as three sub-factors: technical performance, financial performance, and non-financial performance. 2) As a parameter, a sub-factor of competency, the effect on business performance was studied by selecting technology innovation competency and technology marketing competency. 3) The relationship between the entrepreneur's business and the impact on management performance according to industry was compared and verified.

3. Theory and hypotheses

As we looked at the effect of success variables on the SMEs' competency and management performance in the theoretical background: it has been found that previous studies have failed to comprehensively study potential influence variables such as management ability, technical ability, exit strategy, technology commercialization competency, and technical marketing competency. Therefore, in this study, the success variables were studied not only on the effect on corporate competency and business performance but also on SMEs' competency in management performance.

We established three hypotheses to test these research topics. Technical expertise and management skill were studied as factors influencing SMEs' innovation capability and competitiveness (Hwang, Choi and Shin 2020). The research model suggested that technological competence will have a positive (+) effect on the core competency of small and medium-sized entrepreneurs. (Kim, Cho and Lee 2020). According to entrepreneurs, six startup success factors were studied (Prohorovs, Bpositively 2019). Therefore, the success variables expected to affect the entrepreneurs' ability to be studied sporadically in previous studies were summarized as external factors such as entrepreneurship education, government support, and investment were excluded. In this study, it was necessary to study the entrepreneurs' success and technical factors as factors that influenced entrepreneurs' success, excluding external factors. Therefore, there is a need to verify the effect of SMEs' competency on technology and management. For this reason, entrepreneurs propose the following hypothesis.

Hypothesis 1. Entrepreneurial success variables will have a positive effect on competency.

As an independent variable, the effect of corporate competencies on the success of business incubators was studied (Pauceanu, Alpenidze, Edu and Zaharia 2019). The dynamic competencies positively impact the business performance of start-ups was presented (Seo and Lee 2019). An empirical study on the effect of technology commercialization competency on management performance, technical competency, and marketing competency as a control variable for technology commercialization competency as independent variables was studied (Park and Yang 2018). An empirical research model on the impact of performance and technology commercialization competency was presented (Bae, Song and Kim 2018). Technology innovation and commercialization competencies studied the effect of management performance (Kim and Park 2018). Therefore, the necessary competencies that affect performance as the number of mediating success variables need to focus on technological competencies and verify their effectiveness. The reason was that it was necessary to test the hypothesis that in order to create business results, there would be necessary variables that mediate success factors. External factors such as entrepreneurship, government support, and investment were excluded. As a mediator of entrepreneurs' success, excluding external influences, it was necessary to focus and study the technical factors. Therefore, there is a need to verify the performance impact on the technical side. For this reason, the following hypothesis was proposed.

Hypothesis 2. SMEs' competencies will have a positive impact on performance.

The effect of SMEs' CEO technology competency on management performance was studied (Lee I.K. 2016). A research model was presented on the impact of technological competency on management performance (Yoon, J.H. 2018). Knowledge and networks in the global start-up process study suggested a network (Englis, Wakkee and Van Der Sijde 2007). The effect of core competencies and network competencies on SMEs' management performance was studied (Kim and Bang 2017). An effect of network competency on technological innovation capability and innovation performance was studied (Kim, J.Y. 2017). Therefore, it was found that the success variables affecting business performance were studied from various perspectives. In this study, it was divided into a management perspective and a technical perspective. In terms of management, it is necessary to categorize it into four sub-factors: management and exit strategies, technical ability, and technical commercialization ability, to verify the effectiveness. The reason is that to create business results, and it is difficult to identify the effect factors without excluding external factors. As a variable of success for entrepreneurs, it was necessary to study focusing on technology and management factors, excluding external influences. Therefore, the following hypothesis was proposed.

Hypothesis 3. Success variables will have a positive effect on Technical Performance.

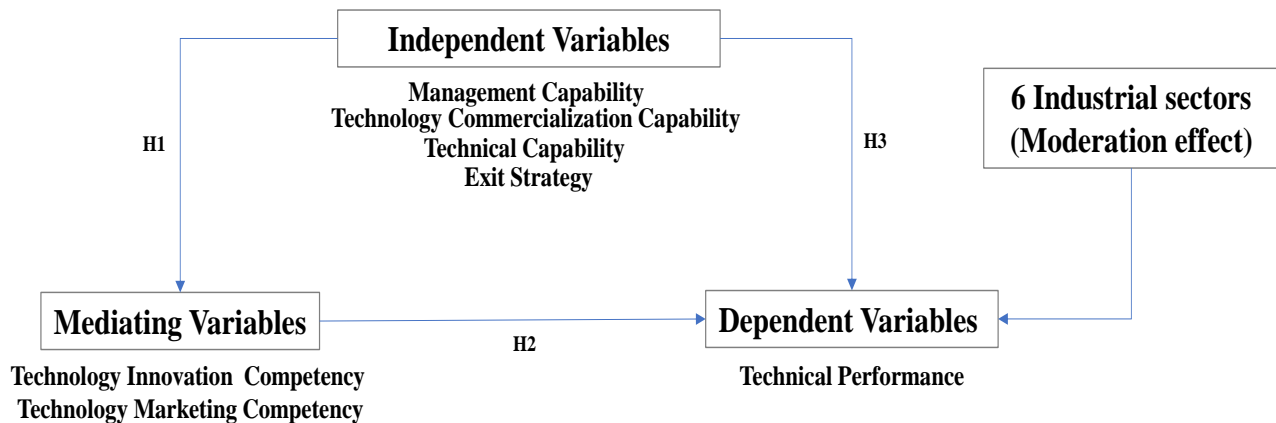
The conceptual research model is shown in Figure 1.


Figure 1. Conceptual research model

Studies on differences in performance and impact according to SMEs' industrial classification were not found in previous studies. It is very commercially meaningful in that it can provide a realistic and feasible alternative. This study confirmed whether there is a difference in the size of the impact on the industry sector's business performance. Using Data Group Analysis (DGA) to validate the differences in competency and business performance across six industries is a unique and differentiated point from previous studies. The final structural study model is shown in Figure 2.

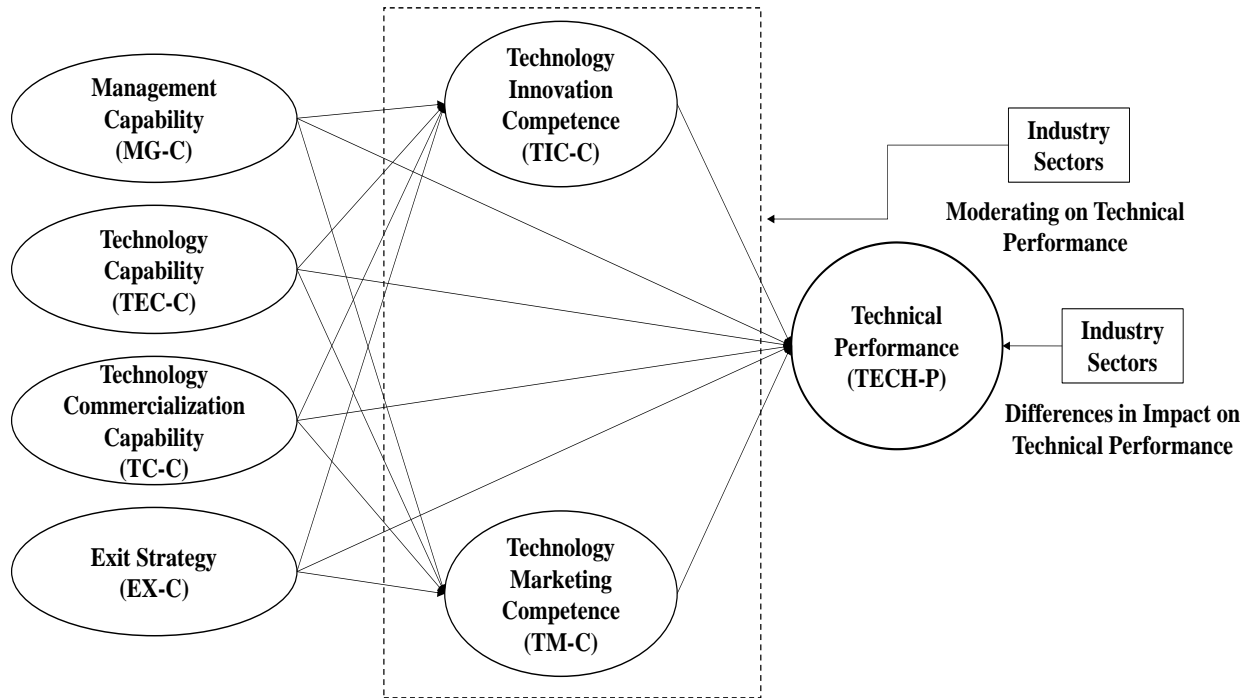

Figure 2. Final structural research model

4. Materials and methods

The data was collected using an online questionnaire method for 330 CEOs of SMEs based on manufacturing. The questionnaire was collected from 205 CEOs, and the response rate was 62%. SMEs are less than five years after the start-up. The industrial sector is six fields defined in Korean start-up company classification criteria: electrics/electronics, machinery/parts, IT/SW, chemicals/textiles/materials, life/food, crafts/others. The 5-point scale was used to measure the questionnaire. The collected data were analyzed and verified along with the basic statistics and measurement and structural models by SPSS 22 and Smart PLS 3.2.9. Among the collected data, insignificant measurement indicators were removed through factor analysis. To confirm the reliability and validity required for evaluating the reflex measurement model, the internal consistency reliability, convergence validity, and discriminative validity were evaluated by running the PLS algorithm. The internal consistency reliability was evaluated by Cronbach's α, Dijkstra-Henseler's rho$_A$, and Composite Reliability (CR). Outer loadings, measurement variable reliability, evaluated the convergent validity, Average Variance Extracted (AVE). Discriminant validity in a reflective measurement model was assessed using Fornell-Larcker Criterion (FLC), cross-loading (Hair et al. 2017).

The model of this study consisted of a reflective measurement model consisting only of reflective indicators. The collected data were analyzed first using SPSS, and the analysis of factors was used to remove insignificant measurement indicators. In this study, internal consistency reliability, concentration validity, and discriminant validity were analyzed and evaluated. Cronbach's α, Dijkstra-Henseler's rho$_A$, and Composite Reliability (CR) of internal consistency reliability assessment are criteria for evaluating internal consistency reliability, and Average Variance Extracted (AVE) is a criterion for evaluating concentration validity. If the AVE square root of the diagonal is larger than the correlation between the study variables below the diagonal, the discriminant validity

between the study variables is evaluated. For the evaluation results and interpretation of the reflective measurement model, Fornell-Larcker Criterion was used for external loading, measurement variable reliability, AVE value, Cronbach's α, rho_A, Composite Reliability (CR), and discriminant validity. PLS-SEM performs Bootstrapping and Blindfolding to evaluate the reflected structural model and verify the hypothesis, and then verify and analyze the multicollinearity, coefficient of determination (R^2), effect size (f^2), and predictive suitability (Q^2). Finally, we confirmed that the structural model was suitable and evaluated the path coefficient's significance and the model's suitability. Lastly, by introducing industry-specific variables, we confirmed the difference in influence by industry. By verifying the influence on the moderating effect on business performance as a dependent variable, we confirmed that this study's model was suitable and found that it had a moderating effect.

The demographic characteristics are as follows. The gender distribution was 66.8% for men and 33.2% for females, respectively, and the proportion of males was 60.5% for a private company and 39.5% for corporate companies. In the industry sectors, electrics/electronics 18.5%, machinery/parts 14.8%, IT/SW 17.6%, chemicals/textiles/materials 17.6%, life/food 12.7%, and crafts/others 19.0%. Regarding the number of years of respondents' start-ups, 32.2% was less than two years or less than three years, 32.2% was less than one year, or less than two years, less than 7.3%, more than five years 4.9%. Looking at the sales volume of t,he previous year, less than 0.1 million $ was the highest with 35.1%, followed by 32.2% from 0.1 million $ to less than 0.3 million $, 22.0% from 0.3 million $ to less than 0.5 million $, and less than 0.5 million $ to 1 million $ 9.3 %, 1 million $ or more 1.3%. In terms of the manufacturing method, outsourcing and in-house manufacturing accounted for the largest share at 62.0%, outsourcing 22.9%, and 15.1%. In terms of the number of employees, less than three people were the most 46.3%, more than three and less than six people were 39.0%, more than five and less than ten people were 13.7%, more than ten people were 1.0%. By age group, the 30s were the highest with 40.0%, the 40s were 38.5%, the over 50s were 12.7%, and the 20s were 8.8%.

Independent variables

Management ability
As a study on the manager's psychological characteristics, it means that creative innovation that enables the development of new products, technologies, and procedures through new ideas, development, and research and development through innovation of management characteristics (Franco, Hope and Lu 2017). Research on management ability is significant because it can explain the relationship between the manager's differences and management performance more systematically and concretely than research based on its characteristics. The evaluation of observable management ability can give the company's manager a direction for the company's development. Early-stage SMEs are not precisely organized, so there is a limit to creating results based on the organization's capabilities. Although management abilities vary from time to time in each study, technical competence, strategic thinking ability, and organizational competency are considered to be very important in common (Andreou, Karasamani, Louca and Ehrlich 2017).

Technical ability
Technical ability is an essential resource for promoting and supporting a company's innovation strategy and sustainable success and as an important result of innovation activities (Burgelman and Sayles 2004). The company's technical ability was presented in seven categories: learning ability, R and D ability, resource allocation ability, production ability, organizational ability, and strategic planning ability (Yam et al. 2004).

Technology commercialization ability
In a narrow sense, technology commercialization is limited to how products or services are created after the basic research or development stage, which is a technology development activity. New technologies acquired through own research and development or external procurement can be defined as a continuous process from prototype manufacturing, pilot production, mass production system construction, marketing, and sales activities to link actual production and sales (Nevens 1990). It has been reported that systematic technological innovation ability and technology commercialization ability affect management performance by revealing that a long-term strategic plan is being made (Booz, Allen and Hamilton 1982).

Exit strategy ability
A study was conducted on the exit strategies of SME managers (Kim, S.Y 2014). The venture company's EXIT strategy and cases by type were studied (Kwon, O.H 2009). An empirical study was conducted on business commercialization and technological innovation on management performance (Bae, H.B., Song, M.K., and Kim, S.G 2018).

Mediating variables

Technology innovation competency
Technology innovation competency is critical that leads to the continuous growth of a company. At the same time, it is a characteristic of a comprehensive company that promotes and supports technological innovation (Burgelman, Christensen and Wheelwright 2008). On the other hand, it was analyzed that the relationship between R and D investment level and business performance was negative or not at all (Coombs and Bierly 2006). In a study of the technological innovation system framework and the entrepreneur's view of innovation, the technological innovation system-generated valuable insights into the processes that need stimulation for the successful development and implementation of innovative sustainability technologies (Planko, Cramer, Hekkert, and Chappin 2017). It has been shown whether innovation capacity positively affects the company's performance (Saunila 2017).

Technology marketing competency
Viewing the results of the analysis of the success or failure of technology development, marketing's importance is reduced. In other words, 20 ~ 40% of the technical failures are due to defects in the technology itself (Miller and Power 2005). A rest is due to the lack of marketing competency, especially in high-tech products, due to the lack of marketing competency reaching 75% (Clugston 1995). The concept of technology marketing is interpreted differently depending on the researcher and expressed in two ways. As a unique research area of marketing, it is a high-tech product marketing that sells or purchases products with technology-typed products through marketing techniques.

Dependent variables

Technical Performance
Technical Performance has a relatively large effect on technical and technical management competency, production support, marketing competency, research and development competency, and new product development competency. It has a significant impact on market information as well as business performance. It is said that the securing of superior technology can directly act as a determinant of investment by venture capital or other

investment companies because it is directly related to the growth or profits of venture companies (Johannisson 1986).

5. Results

Evaluation of the measurement model

The evaluation of the research model's measurement model was carried out using the PLS Algorithm of Smart PLS 3.2.9 to analyze and evaluate internal consistency reliability, concentration validity, and discriminant validity. PLS path modeling was developed by Wold (1982), which is essentially a regression sequence in the form of a weight vector. The weight vector obtained at convergence satisfies the fixed-point formula (Dijkstra 2010). The PLS Algorithm execution basic setting for evaluating the reflective measurement model was performed using the path weighting method, the maximum repetition 1000 times, and the stopping criterion set to 10^{-7}. Internal consistency reliability was assessed by Cronbach's Alpha, Dijkstra-Henseler's rho$_A$, and Composite Reliability (CR). The convergent validity by outer-loadings, measurement variable reliability, and AVE. The results are shown in Table 1.

Table 1. Evaluation results of the reflective measurement model

Type of variables	Latent variable*	Convergent validity			Internal consistency reliability			Discriminant validity
		Outer loadings	Measurement variables reliability	AVE	Cronbach's Alpha	Dijkstra-Henseler's rho$_A$	Composite reliability (CR)	Cross loadings
		>0.7	>0.5	>0.5	0.5~0.9	>0.7	0.5~0.9	
Independent variable	EX-C	0.952	0.905	0.905	0.895	0.895	0.950	Yes
	MG-C	0.937	0.877	0.877	0.860	0.860	0.935	Yes
	TC-C	0.867	0.751	0.831	0.797	0.800	0.908	Yes
	TEC-C	0.912	0.831	0.752	0.917	0.919	0.938	Yes
Dependent variable	TECH-P	0.868	0.753	0.754	0.836	0.835	0.902	Yes
Mediating variable	TIC-C	0.912	0.831	0.748	0.887	0.888	0.922	Yes
	TM-C	0.876	0.767	0.767	0.899	0.902	0.929	Yes

The abbreviation of latent variables* is as follows. Management Capability (MG-C), Technology Capability (TEC-C), Exit Capability (EX-C), Technology Commercialization Capability (TC-C), Technology Innovation Competency (TIC-C), Technology Marketing Competency (TM-C), Technical Performance (TECH-P).

Convergent validity was assessed by outer loadings, measurement variable reliability, and AVE. The measurement variables' external loads were all over the threshold of 0.7, indicating a concentration validity. The results of external loading and cross-loading analysis are shown in Tables 2 and 3.

Tables 2. Evaluation results of measurement model (outer loadings)

Type of variables	Latent variables	Indicators	EX-C	MG-C	TC-C	TEC-C	TECH-P	TIC-C	TM-C

		TP2					0.823		
		TP3					0.890		

As shown in Table 1, the Average Variance Extracted (AVE) value, which is another criterion of the concentration validity, also confirmed that the convergent validity was secured as all the measured variables were

the threshold value of 0.5 or more. Fornell-Larcker Criterion (FLC), Cross Loadings are presented as criteria for determining the reflective measurement model's discriminant validity. FLC is a criterion for determining discriminant validity. Since the square root of the AVE of the diagonal is larger than the correlation between the study variables below the diagonal, the discriminant validity between study variables is evaluated. The results are shown in Table 4.

Evaluation of the structural model

The structural model's evaluation can be seen as a procedure to confirm the research model designed and developed by the researcher and confirm that the structural model is suitable. Once the structural model is found to be a suitable model, hypothesis testing can be performed. This study evaluated and confirmed multicollinearity, coefficient of determination (R^2), effect size (f^2), and predictive suitability (Q^2) for evaluation of structural model in PLS-SEM. Table 5 shows the verifying of the internal VIF value by executing the PLS algorithm to confirm multicollinearity. If the Inner VIF Values among the study variables are less than 5, it can be judged that there is no multicollinearity. As a result, all of them are less than 5, so it can be estimated that there is no multicollinearity. Evaluate the explanatory power of the endogenous research variables, the results of verifying the coefficient of determination R^2 by executing the PLS algorithm are shown in Table 6. The effect size (f^2) is used as a criterion for evaluating the relative influence of exogenous study variables (or predictors or independent variables) on the endogenous study variables. If f^2 is 0.02, it is evaluated as a small effect size, 0.15 as a medium effect size, and 0.35 as a big effect size. Table 7 shows the results of checking the effect size (f^2). Evaluate whether the structural model has predictive suitability for specific endogenous study variables. For this purpose, predictive suitability (Q^2) is used. If the structural model is Q^2 greater than 0 for a specific endogenous study variable, it is predicted to be predictive fit. Blindfolding of Smart PLS 3.2.9 was performed to confirm the results of Cross-Validated Redundancy and to evaluate Q^2. The results are shown in Table 8.

Verification of hypotheses

Since the structural model's evaluation is appropriate, the hypothesis verification can be carried out through bootstrapping. The significance and adequacy of the path coefficient are evaluated using the t value calculated through the execution of bootstrapping. Through this, a hypothesis test was conducted. Bootstrapping of Smart PLS 3.2.9 carried out the significance and suitability evaluation of the path coefficients. It was verified by checking the t-value, p-value, and confidence interval required for hypothesis testing at the significance level of .05. The results are shown in Tables 9 and Figure 3.

**Figure 3.** Hypothesis verification result (T-value/P-value)

As a result of hypothesis verification, as shown in Tables 9 and Figure 3, the critical and significant paths are as follows. *Hypothesis 1:* Technology capability (TEC-C) had a significant influence on both technical marketing (TM-C) and technological innovation capability (TIC-C). *Hypothesis 2:* Technical marketing competency (TM-C)

strongly influenced technical performance (TECH-P). *Hypothesis 3:* MG-C→TECH-P, Management Capability (MG-C) strongly influenced technical performance (TECH-P).

Moderation effect verification

According to the industrial classification, the moderation effect on the Technical Performance was significant with the path coefficient of .114, the T-statistic of 1.782, and the P-Value of .075 (p <.10). The results are shown in Tables 10 and Figure 4.

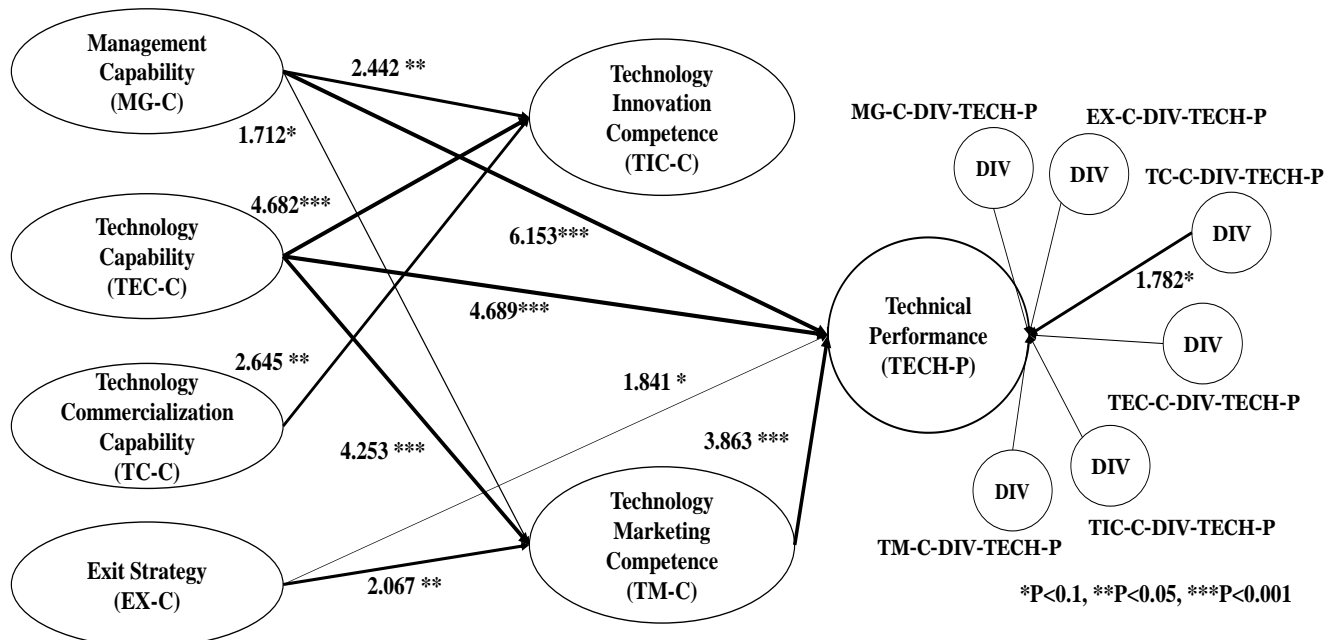

Figure 4. Moderation effect verification result (T-value, P-value)

As shown in Table 10 and Figure 4, it was confirmed that the impact factors on technical performance differ by industry. In particular, technology commercialization capability affects technical performance due to the moderating effect of industrial classification. This result proved the study's purpose that the influence factors showing the modulating effect will differ depending on the industry sector. A data group analysis was conducted to verify what latent variables have different effects depending on the industry sector and whether there are differences between industries.

Analysis result of technical performance impact by industry sectors

We compared and verified the differences between R^2, f^2, total indirect effects, specific indirect effects, and total effects on the Technical Performance impacts of six industries. Six industries are DIV 1 (electrics/electronics), DIV 2 (machinery/parts), DIV 3 (IT/SW), DIV 4 (chemicals/ textiles/ materials), DIV 5 (life/food), DIV 6 (crafts/others). We used Data Group Analysis to identify differences in Technical Performance according to six industry classification. The results are shown in Tables 11 to 15.

Table 11. R^2 Result of technical performance impact by industry sectors

In Table 11, R^2 shows that DIV 1 (electrics/electronics) has a low impact on Technical Performance from .858 to .810, but increases in all other DIV 2 ~ DIV 6. In Tables 12 and 13, f^2 shows that factors affecting Technical Performance differ according to DIV, which means that learning and education methods that improve existing uniform abilities and competencies to create technological outcomes according to industries are different. Differently, it is essential to know that specialized education and learning for each industry sector is required. In Table 14, the total indirect effects were found to increase technological capability on Technical Performance except DIV 4 (chemicals/textiles/materials) and DIV 6 (crafts/others).

In Table 15, the Special Indirect Effect on Technical Performance is significant except for DIV 3 (IT/SW) and DIV 6 (crafts/others) when the technical capability is through the technology marketing capability. Electronics confirmed an increase in indirect effects. Besides, the exit strategy (EX-C) increased significantly in DIV 5 (life/food) and DIV 6 (crafts/others) via technology marketing. Overall, the technology marketing competency (TM-C) confirmed that the Special Indirect Effect was high. In Tables 16 and 17, the total effect on the Technical Performance was found to be increased in three or more factors: DIV 3 (IT/SW), DIV 1 (electrics/electronics), and DIV 5 (life/food). In particular, DIV 3 (IT/SW) found that the total effect of technology capability, technology innovation capability, and technology commercialization capability on technology performance was remarkably increased. It proves to be an essential factor for IT/SW companies to increase their Technical Performance.

6. Conclusions and implications

Given that young SMEs' success in the world is one of the essential policies for each country's future survival, this study examined the causal relationship between the degree and influence of factors affecting entrepreneurial capability and the influential drivers and technical performance.
We analyzed and verified whether the mediation effect is significant, and the impact on the business performance of six industries such as electrics/electronics, machinery/parts, IT/SW, chemicals/textiles/materials, life/food, crafts/others.

The moderating effects of how the factors differ and the degree of influence were verified. In particular, due to verifying the moderating effect on the industry sector's technical performance, it was confirmed that the technology capability is the main influence factor path on technical performance. As for the total effect on the Technical Performance, it was confirmed that DIV 3 (IT/SW), DIV 1 (electrics/electronics), and DIV 5 (life/food) increased the total effect on three or more factors. Mainly, DIV 3 (IT/SW) found that the total effect of technology capability, technology innovation capability, and technology commercialization capability on technology performance was remarkably increased. It proves to be an essential factor for IT/SW companies to increase their technical performance. In the information technology industry and the SoftWare industry, we are trying to survive and grow in the rapidly developing IT environment by making efforts to enhance technology capability, innovation capability, and technology commercialization capability by using Digital Transformation to create the technological performance.

This study suggests overcoming the failure of SMEs' technical performance and which capability and competence in focusing on sustainability. Management capability and technical marketing competency were an important, influential driver for technical performance. Technology capability had a significant influence on both technical marketing and technological innovation capability. This study's results will be provided to government policymakers and practitioners of government support agencies to stimulate youth entrepreneurs' success.

The limitations of this study and future research subjects can be summarized as follows.
First, this study was conducted for the founding companies. However, the significant technology start-up companies' technical field was found in electronics/electronics, machinery/parts, IT/SW, chemicals/textiles/materials/, life/food, and crafts/others. In setting up the surveys into two fields, there was a failure to subdivide all possible technology fields to which technology start-up companies belong. In the future, it will be necessary to conduct further research on the technical fields that have been subdivided with the specification of the technical fields. Second, there was a practical limitation that the former founders could not be targeted in the part of the research that was limited to the youth founding academy in Korea. We will carry out future research as a research topic to include a broader range of founders, including technology startups by country, region, industrial complex, and industry. Third, some of the contents of the questionnaire conducted in this study were focused on the manufacturing field, so there were practical limitations that it was difficult to reflect as many diverse and technical founders as possible.

Groups of technologies in the future can be categorized into manufacturing, non-manufacturing, IT, and industry 4.0, or the eight projects included in the innovation growth performances and future plans jointly announced by related ministries as reporting items for the Korea Innovation Growth Conference. It is necessary to expand further to the core leading business and conduct further research, and to conduct future research as an in-depth research topic following this research.

Abstract. The vast majority of firms in each economy are small and medium-sized enterprises (SMEs) including the family business. Their sustainable development depends on the ability to implement the innovative activities. Most research studies dedicated to innovation are focused mainly on technology-based SMEs. Our paper shows the importance of innovative activities in agricultural SMEs. The main aim of this paper is to identify the key elements covered by three main dimensions (technological, non-technological, and organizational) that have an impact on innovative activities of agricultural SMEs toward their sustainable development and to investigate the perception of these elements by agricultural SMEs. The approach of this study is quantitative, based on the data gathered from 192 Slovak agricultural SMEs.

The results pointed on the importance of all dimensions and three main elements covered each dimension. The results of this paper may help SMEs, professionals, and policymakers to better understand the importance of innovative activities in agricultural SMEs.

1. Introduction

The significant literature and research studies focused on innovative activities in large and medium enterprises prevail the studies that report on innovative activities in micro and small enterprises (Berne et al. 2019; Raghuvanshi, et al. 2019). This paper widespread the literature sources, which suppose that innovative activities are realized also in the micro, small, medium, as well as family businesses. The innovation is pivotal mainly for entrepreneurs and affects all mechanisms related to SMEs' sustainable existence (products and technology development, the improvement of their designs, the production planning, the adoption of new technologies, marketing, sales, management activities, qualification of employees, etc.) The creation and management of innovation in SMEs is a complex process that uses new knowledge, technologies, and processes for the creation of new, as well as adapting existing products or services. The results of innovation activities bring an increase in efficiency and competitiveness, which contribute to the sustainable development of SMEs.

For the agricultural sector, the low level of innovation is typical, due to the fact, that it has been regarded as a low-tech sector, in which the innovations are accrual and are characterized by a low degree of newness (Ciliberti et al. 2016). If the agricultural SMEs realize the innovation activities, they concern the exploitation of new ideas to produce new products, processes, services, or business practices (Caiazza et al. 2016). Various studies reported that there is a gap between the accepted theories and practices in innovation management in the case of agricultural SMEs. We can find differences in understanding, implementing, and measuring of innovative activities in the SMEs (Faherty & Stephens, 2016). The agricultural SMEs are also facing changes in the national and international context. Their innovative activities are currently seen also as a process that results from various interactions among various actors. Each actor is characterized by its own role. Owner or investor provides sources for the realization of innovative activities and customers create demand. Synchronously, new information and communication technologies can reduce the disadvantages in all aspects of agricultural business. An important factor that can contribute to the increase of the innovation capacities of agricultural SMEs is the targeted policy with its objectives, approaches, and tools.

However, the realized studies showed various analyses without relation to specific aspects together. Authors often concentrated on one aspect without studying the relationships with others. We can find studies focused on innovation activities according to the sized category of SMEs, the innovation capacity of SMEs, their connection in various types of networking, internationalization processes, etc. This research aims to fill this gap by analyzing specific dimensions defined by elements that affect the innovation activity of SMEs toward their sustainable development, based on their specificities: type of SME, size category, and focus of business activities. The results point to the SMEs' perception of selected elements that affect innovative activities in relationships to their specificities.

The rest of the paper is structured as follows. As first, we defined three main dimensions that affect the innovative activities of agricultural SMEs toward sustainable development. Based on the literature review, we identified the main elements that belong to each dimension. In connection with specificities of agricultural SMEs (type, sized category, and focus of their business activities) we proposed three research hypotheses. The stated above is summarized in part 2. Literature review and Hypotheses Development. Part 3. Data and Methodology described used methodological approach. We described the sampling and we justified the use of statistical tests for the data evaluation. Part 3. Results and Discussion provide main results, which are compared with previous research works. The part Conclusion brings the final assessment, remarks, and main implications.

2. Literature review and Hypotheses Development

Various literature studies provide many dimensions that affected the innovative capability of SMEs. Pierre & Fernandez (2018) observed fourteen dimensions of the innovation capacity of SMEs, from which six they considered highly relevant: network integrations, institutional support, innovation strategy and planning, innovation dedicated resources, access to cash flow and standards, and regulation. Martinez-Roman et al. (2011) identified three dimensions of the innovative capability: knowledge, organizational structure adapted of the development of the innovation and the human factor. Forsman (2011) identified seven dimensions in which manufacturing and service SMEs could achieve the capabilities for innovations: entrepreneurial capabilities, networking capabilities, utilization of knowledge, risk management capabilities, change management capabilities, business development capabilities, and customer and market knowledge. Lumpkin & Dess (2001) evaluated two dimensions: proactiveness and competitive aggressiveness. In this research, we proposed three main dimensions for the next analysis: technological, non-technological, and organizational. Based on the literature review, we identified and sorted selected elements that represent each of the dimensions (Table 1).

Table 1. The dimensions defined by means of elements

Technological dimension	Non-technological dimension	Organizational dimension
T1 Technological processes	NT1 Marketing	O1 Qualification of employees
T2 Financial intensity of innovative activities	NT2 The effectiveness of SMEs' management	O2 The customers' demand
T3 New techniques and equipment used to produce goods or services		

Source: own processing

Technological dimension relates to elements that nowadays spread to all areas of economic life in SMEs and covers: Technological processes (T1), Financial intensity of innovative activities (T2), and New techniques and equipment used to produce goods or services (T3).

The innovation generation process requires a number of factors such as a high level of technological capabilities, strong R&D, and a pool of multidisciplinary skills (Mahemba & Bruijn, 2003). According to Lazikova et al. (2018), the lack of innovativeness belongs to the internal factor that affects the achievement of SMEs' success. The more rapid technological and market changes foster an environment favorable to innovation (DeTienne&Koberg, 2002; Čižo et al. 2020 a). The innovativeness may result in new technological processes. It is possible to increase the innovation ability of SMEs by providing quick and easy access to external sources of knowledge, new information, and communication technologies (ICT). This is connected with using various types of technological processes. Despite this fact, the application of new ICT tools in SMEs is still lagging behind (Corso, et al., 2003).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Technological processes (T1) are often connected mainly with technology-based firms (Rhee et al. 2010). In our research, we try to find out whether agricultural SMEs' perceived them as an important element for their innovativeness.

The ability to ensure the use of advanced technologies based on the most efficient innovation (Okuneviciute Neverauskiene et al., 2020) depends on financial capability and availability. Finance is a crucial determinant for innovation activities in enterprises, SMEs not excluded (Wonglimpiyarat, 2015); and financial constraints hold back innovation (Hyytinen & Toivanen, 2005). Companies can increase the odds of introducing a new service or product successfully if they allocate more money to their innovation activities (Eggert et al., 2014; Cˇižo et al. 2020 b). Many SMEs carrying out their activities in the agricultural sector have little education and limited exposure to financial instruments related to innovative activities, thus the aspects of the financial intensity of innovative activities (T2) belonged to the second element in the Technological dimension.

The third important element of the Technological dimension selected for analysis was (T3) New techniques and equipment used to produce goods or services. This element related mainly to issues of Industry 4.0, which is characterized by a blending of technologies that erase the boundaries between physical, digital, and biological spheres (Koraus at al. 2020). Innovative and latest technology improves productivity to a greater extent. Automation and information technology helps to achieve improvements in material handling, storage, communication system, and quality control (Kumar & Suresh, 2006). The key to all these processes is human capital in terms of making, utilizing and upgrading changes related to Industry 4.0 (Ivanova et al., 2020).

Non- technological dimension consists of two elements that are necessary for the sustainable development of SMEs: Marketing (NT1) and the effective SMEs' management (NT2).

SMEs' innovation activities are the condition for their survival on the market (Benda-Prokeinová et al., 2017; Caurkubule et al. 2020) and they depend on the strategic orientation of SMEs. The quality of the business environment is often regarded as a major factor in the long-term economic competitiveness and sustainable development of SMEs (Grancay et al., 2015). Competitiveness is basically associated with the application of products in the domestic and foreign markets of organizations, integration groups, or countries to successful participation in the exchange of products of material or immaterial nature at different levels of trade (Simo et al., 2016). It might be well accepted nowadays that intensive competitiveness in terms of both quantity and quality makes it extremely difficult for a firm to differentiate itself from its competitors (Mura & Kajzar, 2019). The market in which the SMEs offer their products or services can be a predictor of the effects of innovative activities. In terms of entering international markets, mainly the industrial production companies have the biggest interest in conducting business activities in international markets (Mura, 2019, Mura et al. 2017). SMEs often have to modify their products sold on the international market, not only from the reason that they aim to achieve outstanding business performance and competitive advantage but also to remain in the international market. According to Bozic & Radas (2006), it is possible to expect that the more present an enterprise is in the international market; the more oriented its innovation activities are towards improving product quality, ecological and health aspects, as well as towards complying with legal standards and various regulations. International trade permits everybody to have more access to the goods and services that are created or performed around the world (Kordos, 2019). Due to the intense competition and constant changes, firms have to increase their innovative manners to maintain their competitive edge also through adaptation of marketing activities (NT1). Keskin (2006) in his research pointed also on the fact that developing and then implementing a marketing plan positively impacts firm innovativeness. Market-orientation in SMEs, driven by the feedbacks of customers, is a mechanistic and narrow form of innovation. SMEs are able to improve profitability by aptly matching customer responsiveness and market-driven pricing policy with product

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

innovation. Research on market orientation, to which the use of marketing tools is subordinated, may benefit from reframing existing models to incorporate innovation more directly (Salavou, 2002; Rak, Zrubak 2012; Korshenkov, Ignatyev, 2020).

The prerequisite for the successful application of innovative activities is also an effective management system in SMEs (NT2). Traditional management style based on centralized top-down decisions with many routines hinders problem-solving in innovative ways (Martinez-Roman et al., 2011). Managers (owners) in SMEs are responsible for the success of their business. They have to determine what actions to pursue at a given time. Uncertainty and the continually shifting situations at the market, pressure them to innovate. Managers (owners) in SMEs can make a better decision when there are fewer constraints imposed by an organization's context (DeTienne&Koberg, 2002). Rhee et al. (2010) in their research stated, that top managers of small firms, therefore, are advised to pay full attention to improvements in innovativeness, with a particular emphasis on an ongoing learning practice, in their effort store superior business performance. SMEs have some limitation to the effective management due to their size, and teams that could solve the problems related to innovative activities can hinder the development of innovations. Most of them have a simple structure, which requires direct supervision.

The third dimension is the Organizational dimension. In our research, it narrows relates to the previous dimensions and elements and it concerns to organizational context in SMEs and consists of Qualification of employees (O1), and The customers' demand (O2).

It is characteristic for SMEs, that the small numbers of staff carry out a range of different functions, manage a small budget, and are occupied with survival and only partially solve the innovative activity. Faherty & Stephens (2016) went deeper and dealt with the issues of the possibility to realize the innovative activities by microenterprises. They recommend simplifying the innovation, due to the fact, that the micro-enterprises regard innovation as a complicated activity that is associated with high-level technology research and development. Also, the learning orientation in SMEs has with a positive effect on the innovativeness of SMEs (Keskin, 2006) due to the fact that business advantages and opportunities emanating from the internally stored knowledge (Dvorský et al, 2019) and the human resources are considered as the cornerstone of the development (Jašková, 2019). Anderson and Boocock (2002) note that self-directed, work-based, and informal learning is dominant in small firms, as it allows increased flexibility and adaptability. Due to the stated above, the first important element in this dimension is the (O1) Qualification of employees. Firms meet the demand of their customers, through markets, by supplying products and services (Liao & Rice, 2010).

When SMEs roll out new products and services, the required market knowledge should be obvious to them, as well as the understanding of how to communicate with costumers. Innovation refers to the generation and implementation of new market offerings that previously were unavailable to the firm's customer (Eggert et al., 2014). The quality of the product is established based on the customers' needs. The right quality is determined by the cost of the product and the technical characteristics as suited to the specific requirements (Kumar & Suresh, 2006). Using customer information contributes to the innovation of SMEs (Keskin, 2006). They have key roles in developing product innovations (Forsman, 2011; Zeibote et al. 2019; Korauš et al. 2019). SMEs should use innovation in combination with a market orientation in order to achieve superior performance in terms of profitability (Salavou, 2002). Stated above requires to know, what is the customers' demand (O2).

In the view of the described context of three dimensions and their elements, we propose the following *research hypotheses*. There is a wide range of studies focused on innovation activities in various contexts observed in large

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

and SME enterprises, but there is a low number of studies focused on the family business. The study of this type of enterprise is limited by the data available from these enterprises, due to the fact, that the exact numbers of these enterprises are not stated in official registers. Within the first hypothesis, we compared the perception of the stated dimension by non-family SMEs and family SMEs. *H1: There are statistically significant differences in the perceptions of stated elements related to innovative activities toward sustainable entrepreneurship between the non-family and family SMEs.*

Similarly, the research studies are focused on the individual-sized category of SMEs or their comparison with other categories. This research provides a comparison of SMEs' perception among three main categories of SMEs by means of the second hypothesis. *H2: There are statistically significant differences in the perceptions of stated elements related to innovative activities toward sustainable entrepreneurship among three sized categories of SMEs.*

The last, third hypothesis is focused on SMEs' perception of stated dimensions according to the focus of business activities of their operation: *H3 There are statistically significant differences in perceptions of stated elements related to innovative activities toward sustainable entrepreneurship of SMEs between SMEs that doing business in Slovak market and those in the international market.*

3. Data and Methodology

To fulfill the main aim of the paper, the questionnaire surveys focused on issues of innovative activities of agricultural SMEs were realized. Data collection was carried out in 2019 within the Slovak regions. According to the Statistical Office of the Slovak Republic, there were 119540 SMEs in the Slovak economy in 2019, of which 3555 entities represented the agricultural SMEs. The estimation of range selection for the questionnaire survey from the number of agricultural SMEs was calculated according to formula (1) from Cochran (1977).

$$n = \frac{Z^2 * p * (1-p)}{e^2} \qquad (1)$$

Where: n is the requested sample size, Z - the Z value (e.g. 1.96 for 95% confidence level), p - the estimated proportion of an attribute that is present in the population (for this research the level of p was calculated using the share of agricultural SMEs in the total number of SMEs in the Slovak Republic), d - desired level of precision and $e = 3\%$. We calculated that the requested research sample should be 123 SMEs. For the realization of questionnaires surveys with appropriate reliability and accuracy, the questionnaire surveys were distributed among 200 agricultural SMEs, from which 192 completed the questionnaire correctly.

Whole research sample (structure in Table 2) we sorted according to the *type* of enterprise (non-family SMEs and family SMEs), the *sized category* (according to the definition of OECD we used three categories of SMEs – microenterprises (less than 10 employees), in which the turnover should not exceed EUR 2 million, small enterprises (10-49 employees), where the turnover should not exceed EUR 10 million and medium-sized enterprises (50-249 employees) turnover should not exceed EUR 50 million), the *focus of business activities* (Slovak market or international market). Due to the fact, that there is no official register of the family business in Slovakia, this research has a limitation in research sampling. The selection of respondents that belong to family SMEs was realized on the principle of snowball method (Heckathor, 2011).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

From 192 of SMEs (Table 2), 38 (19.79%) belonged to the family business. The highest number of respondents (54.69%) in the case of size category of SMEs belonged to the category of micro-enterprises, from which 13.02% belonged to family SMEs. In the category of SMEs according to the placement of their conducted business activities, the highest number of SMEs (92.19%) belonged to SMEs, which operate in Slovakia, of which 18.75% belonged to family SMEs.

Table 2. The structure of research sample

Category	Type	Non-family SMEs		Family SMEs		Total	
		N	%	N	%	N	%
Size category	Micro	80	41.67	25	13.02	105	54.69
	Small	61	31.77	11	5.73	72	37.50
	Medium	13	6.77	2	1.04	15	7.81
	Total	**154**	**80.21**	**38**	**19.79**	**192**	**100.00**
Focus of business activities	Slovak	141	73.44	36	18.75	177	92.19

	Total	**154**	**80.21**	**38**	**19.79**	**192**	**100.00**

Source: own research

Respondents were asked to evaluate their perception of individual elements within stated three main dimensions that have an impact on their innovative activities toward sustainable development (Table 1). Stated elements were selected based on their importance toward the innovative activities of SMEs, as it is described in the previous part of this paper (2. Literature review and Hypotheses Development). SMEs' perception of elements that affect their innovative activities toward their sustainable development was realized through the assessment on six points scale from 0 – does not affect the innovation activity, 5 the mostly affect innovative activities.

The evaluation of obtained results was realized by using the descriptive statistics and parametric and non-parametric statistical tests. Using the statistical tests, we verified three hypotheses set out in section 2. Literature Review and Hypotheses Development. For the stated research hypotheses' evaluation, in the first step we utilized the tools of the descriptive statistics (relative frequency, mean, standard deviation, and median) of the respondents' answers. The second step consisted of the calculation of the Shapiro-Wilk test (SW), due to the fact that the using of parametric test (t-test and one way ANNOVA) depends on normally distribution of variables. If the calculated p-value of SW test is higher than confidence level (p=0.05), the normality is not rejected and it is possible to use the parametric test. Otherwise, a non-parametric alternative to the t-test is used Mann Whitney U test (MWU), for the examination of differences between two independent variables, or Kruskal-Wallis test (KW), to compare more than two independent variables (Balboni et al., 2013; Nachar, 2008). The results of the used test (SW, MWU, KW, and ANNOVA) were significant at $p \leq 0.05$ for all groups of SMEs. The results of these tests for each group of SMEs in the division stated above are provided in the next part of this research.

Results and Discussion

Table 3 presents the results of SMEs' perception of stated dimensions described by elements (Table 1) related to their innovative activities toward sustainable development, depending on the type of enterprise (non-family and family SMEs). The results showed that the most of non-family SMEs (27.08%) as well as family SMEs (4.69%) perceived as the most important element for their innovative activities the O1 - Qualification of employees (3.63±1.32 in case of non-family SMEs and 3.62±1.32 in case of family SMEs). The importance of these results corresponds to the research of Talebi & Tajeddin (2001) who argued that SMEs, where the owners/ managers have

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

technical and vocational qualifications, are more likely, across the board, to innovate. Also, Demirbas et al. (2011) in their research confirmed the necessity of qualified personnel. According to them, firms, where the qualified personnel is missing, show a lower propensity to innovate, and thus, the innovation in a smaller manufacturing firm is unlikely to succeed.

In respect to the normality tests' results (the p-value of SW is lower than 0.05 in each case), to investigate for differences in each element between non-family and family SMEs, the MWU test was executed. As can be seen from Table 3, the MWU test confirms that these two groups of SMEs assigned the same importance to all investigated elements. We can accept the hypothesis H1.

Table 3. The perception of elements related to innovative activities by non-family and family SMEs (SMEs' answers, %)

Element	Category	0	1	2	3	4	5	Mean	SD	Median	SW	MWU
T1	Non-family SMEs	3.13	4.69	9.38	23.44	21.35	**18.23**	3.35	1.32	3.00	0.00	0.71
	Family SMEs	1.04	0.52	3.13	5.73	5.73	**3.65**	3.36	1.30	3.00	0.00	
T2	Non-family SMEs	6.77	15.10	20.31	21.88	10.42	**5.73**	2.36	1.34	2.00	0.00	0.77
	Family SMEs	2.60	3.13	4.69	5.21	4.17	**0.00**	2.40	1.34	2.00	0.00

Source: own research and calculation in the program Statistica

Within the second hypothesis (H2) we evaluated how the stated elements are perceived by micro, small and medium enterprises. For 18.74% of micro-enterprises as well as 11.46% of small enterprises, the most important element was O1 - Qualification of employees (3.64±1.37 in case of microenterprises and 3.64±1.30 in case of small enterprises). For 2.08% of medium-sized enterprises, the most important element was T1 - Technological processes (3.80±1.15). We can notice that between the qualification of employees and technological processes conducted within SMEs is a close connection. Technological processes are an important part of innovation activities as well as in large enterprises as well as in SMEs. The problem with their implementation in SMEs narrow relates to limited human resources. An increase in system complexity, instead, acts in just the opposite way, as it determines the necessity of technological coordination between SMEs and their customers (Corso et al, 2003). Our results are consistent with the results of Rhee et al. (2010) who pointed on the connection between the learning orientation and proprietary technology in an innovative manner. According to them the learning orientation appears to have the potential to create intangible assets such as technology in an innovative manner.

Due to the results of normality's test ($p \leq 0.05$) presented in the Table, in a way to investigate for differences in SMEs' perception among sized categories (micro, small and medium) in the perceived elements, the non-parametric test KW can be performed. In case if the p-value of normality's test is higher than 0.05, the One-way ANNOVA was performed, because, this statistical technique requires that the variables should be normally distributed. The p-value calculated for both tests showed, that if we compared the SMEs' perception of stated elements from the point

of view of their size category, there are no differences in perception of T1 and O1 among agricultural SMEs. Except for these elements there are no differences in perception of elements NT1 – Marketing, NT2 – The effectiveness of SMEs' management and the O2 – The customers' demand. The p-value of calculated tests was higher than the confidence level of 0.05 (see Table 4). The differences in SMEs' perception we observed in case of elements T2 - Financial intensity of innovative activities (p=0.05) and T3 - New techniques and equipment used to produce goods or services (p=0.01). The T2 was the most important mainly for medium-sized enterprises (3.07±1.39). The empirical evidence obtained within our research corroborates the results in the previous studies. Okuneviciute Neverauskiene et al. (2020) considered the financial situation as a factor of sustainable competitiveness. The financial results of enterprises could spur some of innovation investments (Liao & Rice, 2010). Fundamental source for these activities is internal finance (Serrasqueiro et al., 2011), mainly based on profit (Belas et al., 2018). Fabus et al. (2019) highlighted the efficiency of financial decentralization mechanisms, which improve the innovation capability of firms through government support. Similarly, the T3 was the most important mainly for medium-sized enterprises (2.53±1.51). It is related to the fact that the sustainable development of SMEs depends on the successful implementation of modern techniques, technologies and using the appropriate equipment. Nowadays, the Industry 4.0 comes to the forefront (Kordos, 2019), thus the traditional production process takes on a new dimension. SMEs need to respond to this trend if they want to keep their competitiveness and achieve sustainable development.

In addition this paper indicates how the SMEs in depending on whether they carry out their activities on domestic or international market, perceived stated elements toward dimensions that have impact on their innovative activities toward sustainable development (H3). For 29.17% of SMEs with activities on domestic market, the most important element for the achievement of their innovativeness is the O1 - Qualification of employees (3.62±1.32). The same

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

element was the most important for 2.6% of SMEs which carry out their activities at the international market (3.73±1.33).

As it can be seen from Table 5, this result is supported by the calculated p-value of MWU test and ANNOVA (p-value is higher than significance level 0.05 in each of cases), which confirmed that these two groups of SMEs don't perceive the investigated elements differently. Several studies also confirmed the casual relationships between focus of business activities and innovativeness of SMEs (Lee & Lee, 2007; Mahmoud et al., 2016; O'Cass & Weerawardena, 2009). SMEs which are able to reflect on the pressure from the external as well as internal environment regardless to them conducted activities on domestic or foreign market, they are able to innovate. To achieve innovation, it is therefore essential to maintain adaptive behavior, which requires focus on market needs.

Conclusions

The results of our research showed that innovative activities of SMEs are affected by three stated dimensions: technological, non-technological, and organizational. Within these dimensions, we identified three main highly rated elements that SMEs considered as the most important for the realization of innovative activities in their business toward sustainable development (see also in Figure 1).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Figure 1. Descriptive statistics of observed elements.

Source: own research

The most important element according SMEs was the (O1) Qualification of employees (3.62±1.32) This result builds on other studies (Keskin, 2006; Mahmoud et al., 2016; Rhee et al., 2010; Talebi & Tajeddin, 2011 and many others) that have confirmed the importance of skills, qualification, learning orientation and training in SMEs towards increasing of their innovation activities. As confirmed by Polakovic et al. (2015) the education for managers and owners of SMEs is important due to the fact, that they usually get education in order to get soft and hard skills, which are necessary for achieving the required performance of the organization.

Second important element according to the SMEs' perception was (NT2) The effectiveness of SMEs' management (3.40±1.33). Saunila (2014) stated that human factors include the people and social practices as ingredients in organizational success, on which the innovative activities depend. In regard to achieving the innovative activities at the required level, it is necessary to have person/s in firm, responsible for finding the firms' innovative capabilities. Due to the fact, that innovation activity involves the whole organization and conditions of the organizational behavior.

Third, the highly rated element was (T1) Technological processes (3.35±1.32) and and cyber-security strategies. They consist of the ordered sequence of steps that must be followed in order to achieve the innovations. Technology is one of the enablers of innovation (Mambula, 2002). The Industry 4.0 approach permitted the creation of such an environment in which all elements are continuously and effortlessly linked together. The platform of Industry 4.0 could provide also for agricultural SMEs the innovative background. On the opposite side, SMEs' innovative activities are affected by obstacles in the innovativeness processes due to the fast development of technologies (Zambon et al., 2019), financing these activities, etc. Some of the research studies showed the tendency of SMEs

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

to adopt soft technologies as the operating methods, improvements in production processes, methods, organization and the market (Mahemba & Bruijn, 2003; Mambula, 2002)

The understanding of innovation in SMEs has an important economic implication. The innovative activities of SMEs are affected by various elements. This paper provides the results of SMEs' perception of those elements that were in the previous research studies identified as fundamental for SMEs' future development toward sustainability.

As the COVID-19 pandemic continues to create long-term demands for remote work and more online activity, SMEs' must be vigilant in not only maintaining their cyber-security strategies but also in being proactive to prevent cyber attacks and address any possible vulnerabilities before they pose a problem. One of the most important lessons we all are learning during this pandemic is that we are stronger and more successful when we work together, and that is clear in the steps we must take to protect our businesses and to educate the public in proper cyber security.

Abstract. In conditions of a budget deficit, an urgent task facing the state is the development of new instruments that allow replacing budget investments in the creation and modernization of infrastructure with private investments and at the same time optimizing financial costs for these purposes. The priority direction of the investment policy of the regions and the country as a whole is the implementation of socially significant projects using public-private partnership mechanisms, the task of which is to maximize the potential of business for the implementation of the tasks for which the state bears responsibility. The purpose of the study of this article is to analyze the indicators of public-private partnerships in relation to the development of labor mobility, which make it possible to judge the effectiveness of the state policy in the field of employment regulation. The current situation in the labor market is always in the focus of attention of the state, business and society as a whole, affecting both on the economic development of the country, social policy, competitiveness of enterprises, and on the well-being of the individual.

Keywords: public-private partnership (PPP); economically active population (EAP); labor market; labor mobility; workforce; qualified workforce

1. Introduction

Public-private partnership is a contractual relationship between government agencies and private business, which implies mutually beneficial coordinated cooperation between the parties in the implementation of projects of social and state importance, and financial risks, costs and results are distributed in proportions, in accordance with the provisions of a legally binding agreement.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Public-private partnership has established itself as a successful tool for interaction between business and the state. A lot of work is being done in Kazakhstan for the qualitative growth and development of the PPP mechanism. The most active partnership between the state and business is developing in the field of education.

The current stage of development of education in the world is characterized by a special intensity of transformations, equally affecting the organizational and managerial structures of education, its targets and content, methods and technologies of teaching, sources and mechanisms of financing, as well as the conditions and forms of educational, scientific and industrial cooperation.

In modern conditions, the main priority of the state, first of all, in order to maintain and develop the viability and well-being of the people, should be the development of socio-economic processes, the effective performance of the social function. Public-private partnership is not only economic, but also a very important social significance, plays a decisive role in ensuring a particular standard of living of the country's population, in the formation and development of professional opportunities (Isakhova, 2015).

The goal of developing public-private partnership is:
- firstly, the interaction between the state and business;
- secondly, attracting private investment;
- third, stable economic development;
- fourthly, increasing the competitiveness of the national economy;
- fifth, the formation of a single capital market for goods and services, labor resources.

The process of public-private partnership in general is a specific form of relations between the state and private entrepreneurship, used to solve specific problems, which is currently in an active form of demand. In this regard, from a theoretical and practical point of view, it is of particular interest to analyze the formation and development trends of public-private partnership.

Despite the experience of implementing concession projects, one of the main problems hindering the development of PPP in Kazakhstan is the lack of qualified personnel. In addition, the legislation of the republic does not allow to fully implement the concession models used throughout the world. This makes it difficult to attract investment in the social sphere, housing and communal services and other sectors of the economy.

2. Literature review

In many developed and developing countries, public-private partnership is one of the main organizational and economic mechanisms for enhancing innovative activity and attracting long-term investments. PPP as a tool for enhancing and developing innovative activity is widely used by developed countries and has proven its effectiveness in practice.

The literature presents a wide range of studies in the field of PPP and its role in the development of an innovative economy:
- concept and theory by Ablaev I.M., Akhmetshina E.R. (2016),
- methodology by Javed A.A., Lam P.T., Chan A.P. (2014),
- models of interaction between government and business structures in the framework of PPP by Cruz C. O., Marques R.C. (2014),
- approaches to assessing its effectiveness by Berezin A., Sergi B.S., Gorodnova N. (2018).

Authors as Cong X., Ma L. (2018) had considered comparative analysis of international experience in implementing PPP projects. Nevertheless such questions had been considered in the scientific works of Akintoye A., Beck M., Kumaraswamy M. (2016), Roumboutsos A. (2015), Ullah F., Ayub B., Siddiqui S.Q., Thaheem M.J. (2016).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

As international experience shows, studies of Shmelev S. E., Sagiyeva R. K., Kadyrkhanova Z. M., Chzhan Y. Y., Shmeleva I. S. (2018), the implementation of PPP projects is also a way to improve the efficiency of public sector management.

Public-private partnership in the innovation sector allows solving a number of problems of PPP development and has the following advantages:
- provides a great return on research funding, and business entities are interested in the successful solution of issues of further commercialization of their results;
- helps to attract the experience of the private sector and create a competitive environment for open and transparent tenders in the implementation of innovative projects;
- distributes responsibility between partners: the state sets the goals of the project in terms of public interests, determines the cost and quality of parameters, monitors the implementation of projects, and the private partner takes over operational activities at different stages of the project - development, financing, construction and operation, management, practical implementation of services and products.

The study of the aspects of public-private partnership allows us to analyze the mobility of labor resources, since without a mobile labor market, our country is unlikely to be able to quickly solve the issues of modernization and ensuring the innovative orientation of its economy, which would allow it to take its rightful place, in particular, to enter the top twenty competitive countries of the world.

The transfer of new technologies, production and management experience, the replenishment of knowledge and skills, as well as other positive changes in social reproduction are associated with the mobility of the population.
The solution of the entire range of economic and social problems of the development of public-private partnerships requires consistent and steady development and increased efficiency of interaction between the state and business. Thus, E.B. Domolatov, I.N. Dubina, A.N. Turginbayeva (2018) consider in their publications the importance of public-private partnership (PPP) for sustainable growth and increasing the competitiveness of the national economy, and also determine the constraining factors for the development of cooperation in the field of public-private partnership and the use of its mechanisms in the development of innovative investment processes in the economy of Kazakhstan.

On the one hand, the complication of socio-economic life makes it difficult for the state to perform socially significant functions. On the other hand, business is interested in new investment objects (Efimov, 2017). An important role in the implementation of this task is assigned to the economic analysis of the activities of business entities, with the help of which the strategy and tactics of enterprise development are developed, plans and management decisions are justified, their implementation is monitored, reserves for increasing production efficiency are identified, the results of the enterprise, its divisions, employees are evaluated ... Labor resources are the first productive force of social production, and labor productivity is the determining criterion for the socio-economic development of society as a whole.

The public sector of the economy is important in the life of society. This is due to the fact that the scope of providing important social services, such as health care, social protection and education, largely determines the level of human capital development. As you know, human capital largely determines the potential of the economy and creates important conditions for its development. Thus, the public sector of the economy largely determines the development prospects of the state. In this regard, the use of effective and proven organizational technologies that can significantly improve the quality of services provided in the public sector of the economy is vital.

In world practice, public-private partnership has established itself as an effective mechanism for optimizing budget expenditures, which allows you to successfully solve important problems of a public nature by attracting private financial and intellectual (human) capital (Shlafman, 2013).

Improving the use of human potential is the main source of social and economic growth. Hence, the importance of collective study and analysis of the main factors that determine both the formation of the composition of labor resources, their professional structure and qualifications, the level of general and special training, and ways to increase labor efficiency. The solution to these problems is possible on the basis of mutually beneficial cooperation in the form of public-private partnership.

Bogdashkina I.V., Kuspanova A.E. (2018) examining the problems of employment, they describe in their publications that effective employment of the working-age population cannot be ensured without purposeful efforts by the state for redistribution, training and social support and protection of citizens. However, these efforts must be consistent with the freedom of activity of the subjects of market relations, meet the requirements of the labor market. Meanwhile Dmitriev Yu. (2015) believes that employers, who are extremely dissatisfied with the state "efforts" in the field of personnel training, also do not show high activity in the area of personnel training.

Analyzing the strategies for improving the quality of the labor force Menshikova M.A., Abbas A.B. (2017) argue that the new economic conditions require serious changes in the structure and characteristics of the labor force by creating a strategy to improve its quality.

According to M. Simonova (2018), improving the quality of the workforce is a systemic task, in the solution of which various states, economic, social, legal, and economic structures should be involved, and their constructive interaction should ensure the required level of quality. The need of post-industrial production for workers who are able not only to meet the requirements, but also to initiate subsequent development, should create conditions for the formation of just such qualities of the human personality.

In the future, the consolidation of the resources of business, the state and the education sector in the development of the system of not only secondary vocational education, but also higher vocational education is possible on the basis of mutually beneficial cooperation in the form of public-private partnership (hereinafter - PPP). In conditions of tight budgets, both regional and republican, public-private partnership is becoming a tool that allows you to implement various projects with minimal state participation.

Studying the foreign experience of public-private partnership, Shadrintseva A.N. (2015) notes that in the world practice there are two types of cluster creation:
1 The first approach provides that at the state level sectoral and regional priorities and the clusters that are planned to be developed are selected (in countries with stronger state regulation of the economy (France, Korea, Singapore, Sweden, Finland, Slovenia, etc.). public authorities purposefully create infrastructure for priority clusters, as well as determine the amount of funding, while funding for these activities can also be supported from the federal budget, including through the implementation of measures of state support for small and medium-sized businesses.
2 In the second approach (used in countries pursuing liberal economic policies (USA, UK, Australia, Canada, etc.), the initiative to create clusters comes from the economic entities themselves operating in market conditions, and government bodies are extremely rarely involved in creating infrastructure and financing the creation of clusters, however, they create a system of incentives for the interest of regional authorities, which are responsible for the effectiveness of the functioning of the created cluster (Shadrintseva, 2015).

The effective use of labor potential is one of the most important tasks of the formation of a socially oriented state, carried out within the framework of state policy in Kazakhstan.

The labor market as a multifaceted, heterogeneous, dynamic system of socio-economic relations is designed to ensure the constant reproduction and efficient use of labor. With the development of scientific, technical, technological and informational progress, the role of the labor market increases. Therefore, the creation of a balanced labor market in order to replenish the growing sectors of the economy with highly qualified personnel becomes necessary in modern conditions, especially in the interaction of the state and business.

The effective use of labor potential is one of the most important tasks of the formation of a socially oriented state, carried out within the framework of state policy in Kazakhstan, in this connection, the labor market as a multifaceted, heterogeneous, dynamic system of socio-economic relations is designed to ensure constant reproduction and effective use of labor.

With the development of scientific, technical, technological and informational progress, the role of the labor market increases. Therefore, the creation of a balanced labor market in order to replenish the growing sectors of the economy with highly qualified personnel becomes necessary in modern conditions, especially in the interaction of the state and business.

In her scientific publications, Chagina E.A. (2017) considers the labor market as an economic system, where it is necessary to take into account that the socio-infrastructural characteristics of a particular territory determine the degree of closeness of local labor markets. The level and quality of development of the social sphere and engineering infrastructure of the region and territory plays a key role for the development of labor mobility as the most important qualitative indicator of its market value, confirming the integrity of the basic elements of the labor market - labor prices, supply and demand.

In the system of economic relations, labor resources occupy an important place, since labor resources are one of the indicators, the state of which makes it possible to judge national well-being, stability and efficiency of socio-economic transformations. Some authors, such as P.E. Schlender, Yu.P. Kokin (2019), believe that labor resources are a category that occupies an intermediate position between the economic categories "labor potential" and "total labor force". They note that labor resources are the able-bodied part of the population, which, having physical or intellectual capabilities, is able to produce material goods and provide services.

For example, V.B. Bychin, V.N. Bobkov (2017) argues that "labor resources are part of the country's population capable of participating in the national economy at a given level of development of productive forces and within the framework of these production relations".

According to I.I. Eliseeva (2018), "labor resources are a part of the population with the necessary physical and intellectual abilities and knowledge to work in any area". From this definition, it means that labor resources include both real workers who are already employed in the country's economy and potential workers who are not employed but can work.

Volgin Yu., Odegova Yu.G. (2018) believe that "labor resources represent the working-age population of working age, as well as the resulting set of socio-economic relations at all phases of social production".

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

A.L. Mazin (2017) notes that "labor resources are a collection of people with the ability to work, along with many others. When analyzing them, the task is set to investigate a certain category of the population with all its inherent abilities and needs, and above all for work".

3. Research questions

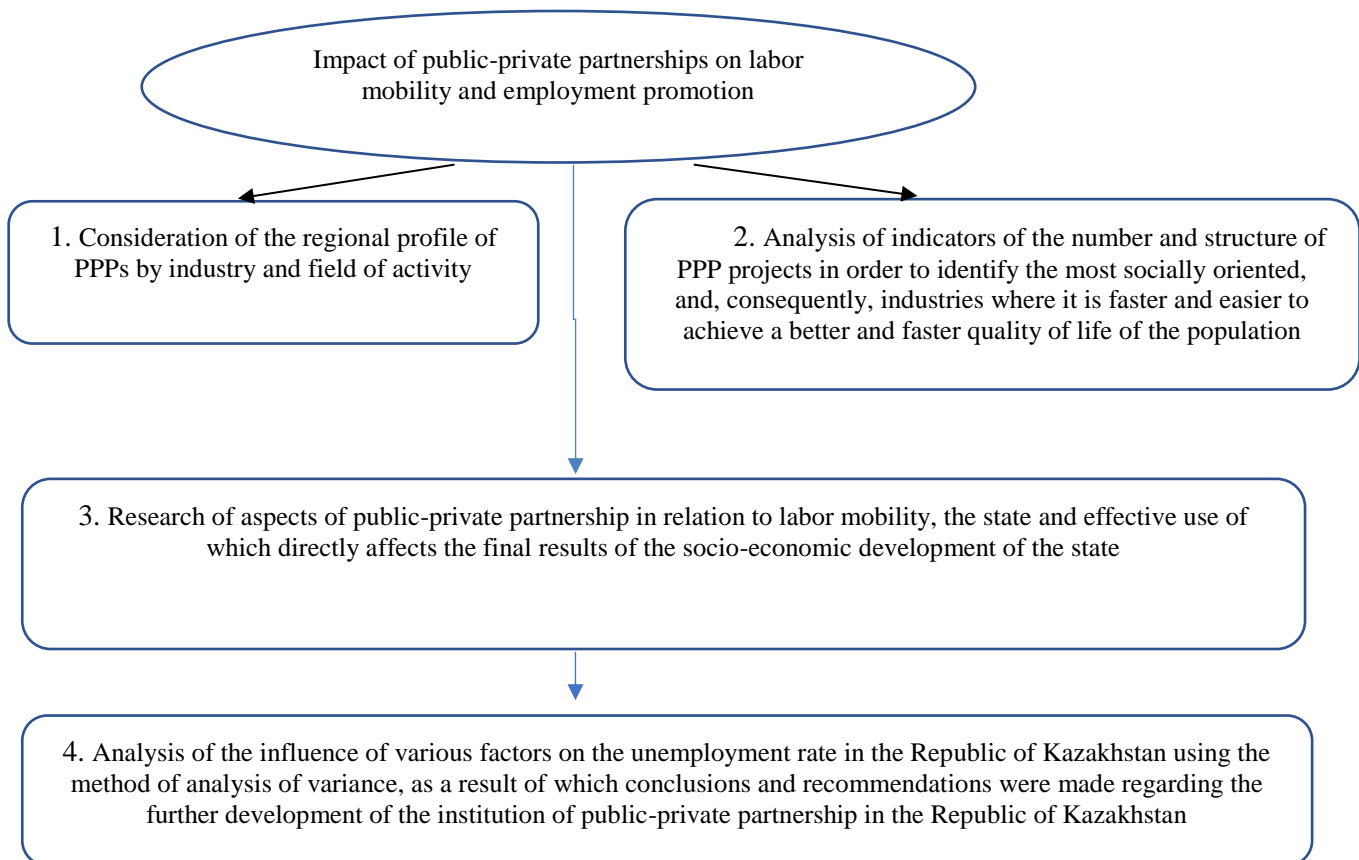
Ensuring the rational use of labor resources in all regions of the country is one of the most important tasks of the socio-economic development of the economic complex of Kazakhstan. To solve it, an objective assessment of the labor resources that society has, the needs of the economic complex in the labor force and the ways of the most efficient and complete use of labor resources in the country and regions, based on the interests of the whole society on the basis of public-private partnership are required (Figure 1).


Figure 1. Research questions
Source: compiled by authors

The implementation of socially significant projects using public-private partnership mechanisms is to maximize the potential of business and the participation of competent government policy. Optimal provision of the economy as a whole and individual enterprises with employees of the relevant specialties with sufficient qualifications is necessary for the successful functioning and development of enterprises on the basis of public-private partnerships.

All over the world, PPP schemes are very often used in connection with the construction of healthcare facilities, education, in the field of transport and road transport infrastructure, during the reconstruction and construction of sports facilities. The popularity of PPPs in these areas is explained by a number of advantages for infrastructure projects as a whole: minimization of the project budget, the best price-quality ratio attractive to private investors, the use of the best management and construction technologies, and reduction of commercial risks due to the participation of the state in the project.

4. Materials and methods

The majority of projects on the territory of Kazakhstan are in the spheres of education and healthcare. In the field of education, this is the implementation of projects for such objects as kindergartens, schools, dormitories for students and teachers, etc., in the health sector - hospitals, clinics, medical laboratories, feldsher-obstetric centers, etc. Regional profile PPPs by industries and spheres of activity at the end of 2019 are presented in Table 1, where the numerator is the number of projects, and the denominator is the share of the region in a particular industry in %.

Table 1. Regional PPP profile by industries and spheres of activity (2019)

Regions	Utilities	Health care	Agriculture, forestry, fisheries	Culture, sports, tourism, information space	Transport and communications	Education	Other industries	Total
East Kazakhstan	3/1	5/2	-	2/1	6/3	205/92	2/1	223/100
Almaty city	2/3	3/5	11/19	5/8	7/12	31/53	-	59/100
Kostanay	8/13	17/28	1/1	6/10	-	26/43	3/5	61/100
Akmola	6/11	4/8	1/2	-	2/4	40/75	-	53/100
Karaganda	6/6	51/49	3/3	14/13	4/4	24/23	2/2	104/100
Kyzylorda	18/16	40/35	1/1	34/30	7/6	11/9	4/3	115/100
Turkestan	20/14	31/21	-	8/6	1/1	66/46	17/12	143/100
Pavlodar	13/19	23/33	-	6/9	1/1	15/21	12/17	70/100
Aktuibinsk	3/7	20/44	1/2	8/17	5/11	7/15	2/4	46/100
Almaty	10/24	5/12	7/17	8/19	3/7	5/12	4/9	42/100
Shymkent city	18/58	5/16	-	4/13	1/3	2/7	1/3	31/100
Mangistau	3/12	4/16	-	1/4	1/4	13/52	3/12	25/100
Nur-Sultan city	1/2	8/17	2/4	3/7	9/20	20/43	3/7	46/100
North Kazakhstan	2/4	8/14	-	4/7	2/4	38/69	1/2	55/100
West Kazakhstan	1/8	5/38	-	1/8	1/8	3/23	2/15	13/100
Atyrau	6/17	5/14	1/3	2/5	1/3	21/58	-	36/100
Zhambyl	1/1	31/27	-	3/3	-	78/69	-	113/100

Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

Most of the projects are being implemented in East Kazakhstan (18%), Turkestan (12%), Kyzylorda (9%), Zhambyl (9%) regions; least of all - in West Kazakhstan region (1%), Mangistau region (2%), Shymkent city (3%), Atyrau region (3%).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

It follows from the above data that there are regions leading in the total number of projects, but projects there are not being implemented in all sectors. The most diversified sectoral structure of PPP is in Kyzylorda, Karaganda, Aktobe, Almaty regions and in the city of Nur-Sultan. All over the world, PPP schemes are very often used in connection with the construction of healthcare facilities, education, in the field of transport and road transport infrastructure, during the reconstruction and construction of sports facilities. The popularity of PPPs in these areas is explained by a number of advantages for infrastructure projects as a whole: minimization of the project budget, the best price-quality ratio attractive to private investors, the use of the best management and construction technologies, and reduction of commercial risks due to the participation of the state in the project.

Also, private financial initiative in PPP projects for the business sector is becoming more common: as of December 31, 2019, 717 PPP contracts were concluded, of which 324 contracts were concluded by private initiative, which is 45%. The average amount of contracts (even if we remove the largest project - BAKAD) from the list, initiated by the state - is 2 billion tenge, while business initiates an average of 1 billion tenge. The amount of state obligations: GI - 362 billion tenge, PFI - 188 billion tenge, and this is a difference of 93%, with a quantitative difference of almost 50%. 235 new projects worth 156 billion tenge were concluded in Kazakhstan using the practice of public-private partnerships in 2019 alone.

In total, as of the end of 2019, 717 PPP agreements were concluded for a total amount of 1.6 trillion tenge, including 9 republican agreements for the amount of 910 billion tenge; 708 - local in the amount of 687 billion tenge (Figure 2). The sole shareholder of Kazakhstan JSC Public-Private Partnership Center is the Government of the Republic of Kazakhstan represented by the Ministry of National Economy of the Republic of Kazakhstan, whose mission is to create conditions for partnership between the state and business, develop and combine their potential for implementing PPP projects and increasing the volume of private investments in the country's economy.

According to statistics from the Ministry of National Economy of the Republic of Kazakhstan, an estimated 8.7 million people were employed in the economy of the republic in July 2019. Among the employed population, the number of employees in the indicated period amounted to 6.6 million people (76.1% of the total number of employed). According to preliminary data of the second quarter of 2019, the share of productively employed people out of the total number of self-employed population was 90.3%, unproductively employed - 9.7%. For comparison, the indicators of the labor market of the Republic of Kazakhstan for the period from 2015-2019 were considered (Table 2) (Official site of Committee on Statistics).

Table 2. Main indicators of the labor market of the Republic of Kazakhstan

Indicators	2015	2016	2017	2018	2019
Labor force, thousand people	8962,0	8887,6	8 998,8	9 027,4	9 169,5
Employed population, thousand people	8510,1	8433,3	8 553,4	8 585,2	8 727,9
Employees, thousand people	6109,7	6294,9	6 342,8	6 485,9	6 612,0
Self-employed, thousand people	2400,4	2138,4	2 210,5	2 099,2	2 115,9
Unemployed population, thousand people	451,9	454,2	445,5	442,3	441,6
Unemployment rate,%	5,0	5,1	5,0	4,9	4,8
Youth unemployment rate,% (aged 15-24)	3,8	4,2	3,8	3,8	3,7
Youth unemployment rate,% (aged 15-28)	4,2	4,4	4,1	3,9	3,9
Long-term unemployment rate,%	2,4	2,5	2,2	2,2	2,2
Persons outside the labor force, thousand people	3715,9	3867,4	3 855,0	3 927,3	3 857,4

Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

In the structure of the employed population, significant differences persist between urban and rural areas. Thus, 84% of the urban population are hired workers, the remaining 16% are self-employed. In rural areas, the share of hired workers is only 61%, and the share of self-employed workers is 39% (Table 3).

Table 3. Analysis of labor resources by employment status in 2019
(thousands of people)

Indicators	In urban areas	In the countryside	In general for the Republic of Kazakhstan
Employed population	4890,7	3662,7	8553,4
Employees, including:	4102	2240,9	6342,8
- at enterprises and organizations	3728,5	1952,9	5681,4
- for individuals	367	174,7	541,6
- in a peasant (farm) economy	,9	174,7	117,9
Self-employed workers, incl.	788,7	1421,8	2210,5
- employers	59,2	59,4	118,7
- independent workers	726,4	859	2080,9
- members of the cooperative	0,2	0,9	1,1

Let's analyze the influence of various factors on the unemployment rate in the Republic of Kazakhstan. For this we will use the method of analysis of variance.
First, let's analyze the impact on the unemployment rate of the place of residence (city or countryside). The required data are presented in Figure 3.

Figure 3. Dynamics of the unemployment rate in the Republic of Kazakhstan depending on the place of residence, in %
Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

Statistics show that the urban unemployment rate is on average 1.05% higher than in rural areas.
Let us put forward and verify with the help of analysis of variance, a hypothesis about the influence of place of residence on the unemployment rate. Using statistical data, it was found that the factorial variance is $s^2_{fact.} = 8,820$, residual variance $- s^2_{res.} = 1,998$. So that $s^2_{fact} > s^2_{res.}$, then, in accordance with the considered method, it follows at the significance level $\alpha = 0,05$ check the significance of their differences. To do this, we calculate the observed value of the F-criterion:

$$F_{observ.} = \frac{s^2_{fact.}}{s^2_{res.}} = \frac{8,820}{1,998} = 4,414.$$

The critical value of the Fischer-Snedecor test at the significance level $\alpha = 0,05$ and the number of degrees of freedom $k_1 = 1$, $k_2 = 30$ equally $F_{crit.}(0,05;1;30) = 4,171$.
As $F_{observ.} > F_{crit.}$, therefore, at the significance level $\alpha = 0,05$ a conclusion should be drawn about the influence of the place of residence on the unemployment rate.

Let us analyze the influence of gender and age on the unemployment rate in the Republic of Kazakhstan, for this we apply a two-factor analysis of variance. The required data are presented in Figure 4.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Figure 4. Unemployment rate in the Republic of Kazakhstan depending on age and gender for 2019, in %
Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

Thus, we see that the highest unemployment rate is observed in the age group from 29 to 34 years old. The unemployment rate for women in every age group is higher than for men, with an average difference of 1.17%.

Let us put forward and test, using two-way analysis of variance, a hypothesis about the influence of gender and age on the unemployment rate. Using the statistical data, we will carry out the necessary calculations. As a result, the following results were obtained:

- factor variance by factor «age»: $s_{age}^2 = 3,363$,

- factor variance by factor «gender»: $s_{gen}^2 = 4,083$,

- residual variance: $s_{res}^2 = 0,277$.

Let's compare the obtained values: $s_{age}^2 > s_{res}^2$, $s_{gen}^2 > s_{res}^2$. Since both found factor variances exceed the residual, in accordance with the ANOVA rule, it is necessary to calculate the observed values of the F-test:

$$F_{obs}^{(age)} = \frac{s_{age}^2}{s_{obs}^2} = \frac{3,363}{0,277} = 12,141, \quad F_{observ}^{(gender)} = \frac{s_{gender}^2}{s_{obs.}^2} = \frac{4,083}{0,277} = 14,740.$$

Critical values of the Fischer-Snedecor distribution at the significance level $\alpha = 0,05$ and the number of degrees of freedom for the factor «age» $k_1 = 5$, $k_2 = 5$, for factor «gender» $k_1 = 1$, $k_2 = 5$ equal to $F_{crit}^{(age)}(0,05;5;5) = 5,050$, $F_{crit.}^{(gender)}(0,05;1;5) = 6,607$.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

As $F_{obs}^{(age)} > F_{crit}^{(age)}$, a $F_{obs.}^{(gender)} > F_{crit.}^{(gender)}$, then at the significance level $\alpha = 0,05$ it should be concluded that both factors «gender» and «age» have a significant impact on the unemployment rate.

Thus, using analysis of variance, we proved that all the factors considered: "place of residence", "gender" and "age" affect the unemployment rate. First of all, it should be noted that there is gender inequality in Kazakhstan, the unemployment rate among women is higher. In addition, unemployment is subject to age differentiation. The largest percentage of unemployed is observed in the age groups from 29 to 34 years old and from 55 to 64 years old. In the latter case, this is due to the pre-retirement age. Also, the percentage of unemployed population in the city is higher than in the countryside. In the context of a significant outflow of the economically active population from the countryside to the city, not only the pressure on the urban labor market is increasing, but also significant changes are taking place in the social structure of the countryside, the deepening of social differentiation and transformation of rural society.

It should be especially noted that the preservation of the category of unproductively self-employed is a factor in increasing the economic burden on the country's budget system.

Regionally, 46% of the self-employed population is located in the Southern region, namely:
- Almaty (12.67%),
- Zhambyl (10.22%),
- South Kazakhstan (22.74%)
- Kyzylorda (5.5%).
The rest of the self-employed population is located:
- North (21.58%),
- Western (10.27%),
- East (9.09%),
- Central (3.31%).

The development of self-employment is driven by both economic and social factors. On the whole, a positive downward trend in the number of the self-employed population remains against the background of an increase in the number of employees.

In 2019, the rate of coverage of the economically active population (hereinafter - EAP) of the country with higher education is higher than 2004 by 9.6%. A significant increase was recorded in 2018 (Figure 5).
Figure 5. Share of the EAP of the Republic of Kazakhstan with higher education, in %
Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

The quality of qualified personnel depends, of course, on the quality of higher education, which stakeholders interpret in different ways:
1. The State Program for the Development of Education and Science prioritizes training, employment and positioning of Kazakhstan universities in the QS WUR international ranking. This ranking focuses on academic reputation, taking into account the survey of experts, employer ratings, faculty / student ratio, the number of international students and faculty, and the citation index. National accreditation agencies in the quality assurance standards of the university also include effective strategic planning, management and information management, student orientation, quality of educational programs, teaching staff, research work, resources, public information, periodic external quality assurance (Standards for Institutional Accreditation).
2. GIK WEF optimally determines the quality of the educational system as consistency between educational programs, graduates' end results and the needs of the labor market. Kazakhstan took the overall 56th place in the fifth direction of the GIK 2018-2019 "Higher education and vocational training" focus on educational coverage, the quality of mathematical and natural science training of applicants, management schools and the possibility of continuing education on the job.
Table 4 shows a comparative analysis in the context of regions in terms of such indicators as the age structure, the proportion of young specialists, the number of IEPs who have undergone advanced training (Nurlanov, Amankazy, Nogaybaeva, 2018).

Table 4. Comparative analysis by regions of the Republic of Kazakhstan

Region	Share of IPR, age structure, in %	Number of IPRs who have completed advanced training courses, people		Share of young professionals in the TVE system, in %
		Number of managers, people	Number of IPR, people	
Akmola	8,7	18	280	8,8
Aktuibinsk	5	16	250	10
Almaty	9,5	26	400	8,7
Atyrau	11,4	12	200	11,5
West Kazakhstan	6,6	18	210	7,8

Almaty city	10,7	15	450	16,6

Source: compiled by authors

According to the data in Table 4, in the context of regions, it can be seen that an increase in the share of IRP of retirement age takes place almost everywhere. A significant increase in this indicator is observed in the East Kazakhstan region and in Almaty. At the same time, there is a decrease in this indicator in Atyrau and Kyzylorda regions. In terms of types of economic activity, the largest number of job vacancies is:
-in industry - 8,599 units;
- in the field of transport and storage - 3,999 units;
- the smallest - in transactions with real estate - 197 units (Table 5).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Table 5. Vacant jobs and expected need for workers by economic activity and type of ownership as of 2019 in Kazakhstan

Indicator	Number of vacancies at the beginning of the reporting period, units	including		
		state property	private property	foreign property
Total	28 305	1 538	8 458	1 243
Agriculture, forestry and fisheries	399	-	-	-
Industry	8 599	76	2 360	414

Healthcare and social services	4 526	744	x	x
Arts, entertainment and recreation	912	76	x	x

Source: compiled by authors

The highest expected staffing requirements are noted:
- in industry (2 850 people);
- in construction (1,694 people);
- in the field of art, entertainment and recreation (1 239 people);
- in the sphere of wholesale and retail trade, car and motorcycle repair (1,199 people) and the share of these types of economic activities in the total expected need for workers was 62.1%.
At enterprises and organizations with private ownership, the expected need for workers in 2019 was 8,458 people, of which:
- in industry - 2,360 people;
- in construction - 1,694 people;
- in the sphere of wholesale and retail trade, car and motorcycle repair - 802 people.
At enterprises and organizations with a state form of ownership, the greatest need falls on the sphere of health care and social services (744 people). Their share in the total expected demand for workers at state-owned enterprises was 48.4%.
According to the Project "Productive Employment", the improvement of the quality of education and, accordingly, the training of qualified personnel must be carried out through:
1. Modernization of educational programs:
- development of innovative educational programs, including the training of IT specialists with competencies in cybersecurity, web design, promotion in social networks;

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

- implementation of minor programs in priority sectors (for example, an educational program in the agro-industrial complex + trade) + maintaining the current state order for industries where there is an outflow of personnel;
- expanding the activities of universities in the implementation of short-term training courses;
- staff mobility (including student mobility, since the attraction of foreign students today is perceived as one of the important indicators of the competitiveness of higher education. This phenomenon is called internationalization of higher education) (Gaidarova, Ashimkhanova, 2016).
2. Development of dual learning.
3. Development of lease financing instruments and the creation of specialized competence centers, laboratories and classrooms of the "new format".
4. Systemic measures to organize the training of qualified personnel, taking into account the new structure of employment:
- restructuring the volume of the state order for training personnel with higher education and vocational education (Program of productive employment and mass entrepreneurship, project Free TVE) for the service economy, taking into account the new structure of employment (Law of the RK, 2018);
- increasing the attractiveness of training courses for blue-collar occupations by introducing an educational Internet platform, digital educational resources.

So, for example, within the framework of the Project "With a Diploma to the Village!" since 2009, measures have been taken to provide social support for specialists in education, health care, social security, culture and sports, and the agro-industrial complex who have arrived to work and live in rural areas (Figure 6) (Program of the President, 2015).
Figure 6. Dynamics of arrived specialists in Kazakhstan under the project "With a diploma in the village!" in the context of industries
Source: compiled by authors

For such specialists, it was provided:
- payment of a one-time lifting allowance in the amount of 70 MCI;
- a budget loan in the amount of 1,500 MCI for the purchase or construction of housing for a period of 15 years, with a remuneration rate of 0.01%;
- an increase by at least 25% of official salaries (tariff rates) for specialists of social institutions located in rural areas.

We would like to note that in 2018, the amendments to the Law of the Republic of Kazakhstan "On migration of the population" established an integral system for regulating the resettlement of citizens. In order to eliminate the disparities in the settlement of the population, it was envisaged to provide economic incentives for the voluntary resettlement of the population from labor-surplus regions to regions with a high potential for the development of the labor market, reception of migrants, with the provision of measures of state support and assistance in employment (Law of the RK, 2018).

Thus, the stable development of the socio-economic situation in the country is facilitated by the mobility of labor resources as one of the main solutions for the optimal use of labor resources in regions with a shortage of labor by moving them from labor-surplus areas. This enables individuals to find a better job offer. Labor resources are one of the most important factors in any production. Their condition and effective use directly affects the final results of the socio-economic development of the state (Berglund, 2017).

Conclusions

The problem of developing the public services sector through the introduction of public-private partnership mechanisms is an urgent task.

In the modern sense, PPP is an institutional and organizational alliance between the state and business in order to implement national and international, large-scale and local, but always socially significant projects in a wide range of areas of activity: from the development of strategically important industries and research and development (R&D) before providing public services.

For the development of public-private partnerships and the implementation of projects similar to the above in the regions of Kazakhstan, it is necessary to create favorable conditions for the formation of this institution. Among the main factors hindering the widespread use of PPP mechanisms in the economy of Kazakhstan are the following reasons:

1) insufficiently developed regulatory and legal framework;
2) the absence of mechanisms for effective financing and insurance of projects equally for all market participants, a significant political component for the implementation of long-term projects;
3) ineffectively functioning legal institutions that could guarantee the rights of private owners participating in projects;
4) limited access of potential PPP participants to large projects due to the high requirements imposed on them by the state;
5) low level of diversity and underutilization of the potential of promising forms and instruments of public-private partnership, which significantly limits the possibilities of its use.

Analysis of the current state of public-private partnership in relation to labor mobility and the prospects for its development within the framework of the general strategy of the third modernization allows us to determine the following main goals of regulating these processes.

1. Meeting the needs of the economy in the necessary labor force, subordinating migration to the solution of medium and long-term goals and objectives of the country's socio-economic development.
2. Formation of an optimal system of population settlement in the territory of the Republic of Kazakhstan.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

3. Ensuring the national security of the Republic of Kazakhstan in the context of threats associated with migration. To achieve the set goals, the following tasks will be required:

1. Building an effective system of external labor migration, focused on meeting the needs of the country's economy, creating a favorable investment climate and improving the quality of labor resources.

2. Updating the policy of ethnic migration, taking into account the strategic development plans of Kazakhstan in order to strengthen national consolidation and create favorable adaptation and integration conditions for ethnic repatriates arriving in the Republic of Kazakhstan.

3. Suppression of illegal migration.

4. Creation of an effective internal migration management system for the purpose of economically justified settlement of the population, ensuring regional and demographic balance in the development of the country.

Approaches to the creation of a modern system of public-private partnership in relation to the management of labor mobility require rethinking and further development.

This study confirms the fact that the issue of increasing the development of public-private partnerships in relation to labor mobility should be included in the general labor market policy; to solve it, additional systems of programs and measures should be used. Such programs and measures include passive and active measures that can be combined to stimulate job seekers to make decisions in favor of moving to a new job in a new location.

Consequently, among the main tasks of public-private partnership, it is necessary to highlight:

- "updating the system of legal regulation of employment and labor relations through changes and amendments to labor and social legislation, orientation of people to an independent active position of citizens in the field of employment and guarantees of social protection to the most vulnerable categories of citizens;

- "macroeconomic regulation of the economy, that is, improvement of the sectoral structure of the economy based on the creation of new industries and the reform of promising ones through privatization, reorganization, re-profiling, implementation of financial and tax policies, consistent with an employment policy that supports the creation of additional jobs;

- "support and active stimulation of the development of small and medium-sized businesses that create additional jobs, including by attracting foreign capital;

- "the formation of a system of social partnership of the main participants in the labor market - the state, employers, workers in ensuring employment guarantees, decisions on wages, working conditions and regimes.

Thus, it is necessary to improve the scientific and methodological foundations of public-private partnership, to develop and create conditions for a wider practical application of mechanisms, models of PPP in cities, adopting the advanced experience of developed countries, in the implementation of socially significant projects.

Abstract. Business monitoring and reporting issues receive close attention. Nationalization of indicators, creation of a statistical database, determination of data sources and methodology for their calculation are in the priority of state policy, especially in a crisis, when enterprises are required to improve production efficiency, competitiveness and effective forms of management in production management. An important role in the implementation of this task is assigned to monitoring the financial condition of enterprises, since it is one of the most effective methods for diagnosing the economic activity of enterprises. Analytical materials prepared during the monitoring process help to carry out a comprehensive analysis and forecast of the financial position of the enterprise and, thereby, to obtain a real assessment of the enterprise's capabilities.The article examines the current state of industry in Kazakhstan, analyzes the problems hindering its development, presents the author's vision of their solution. On the basis of modern scientific and applied literature, various approaches to the formation of the concepts of financial monitoring, methods of analyzing the financial condition of an organization are widely presented.

1. Introduction

Over the years of independence, Kazakhstan, being a rapidly emerging economy, has implemented a number of systemic and structural economic reforms and carried out large-scale privatization. Free development of entrepreneurship has shaped the economy, which has provided real growth in the welfare of citizens. As a result, by the middle of the first decade of the new century, Kazakhstan became one of the most dynamically developing countries in the world. This was also facilitated by the favorable conjuncture of the global resource market, which ensured a rapid growth in production, an increase in the level of income of the population and social transfers, and the formation of a middle class.

The country has now accelerated the transition to diversified economic growth, where efforts and resources are concentrated on a limited number of sectors, taking into account regional specialization and the application of a cluster approach. In the future, it is planned to converge the policy of territorial and industrial development. Kazakhstan has taken a course towards increasing the productivity and complexity of the economy, developing human capital, strengthening the role of the private sector, which will allow the country to overcome the "middle income trap" and reach a new level of development.

Despite the favorable dynamics of industrial development in 2019, the impact of the global financial crisis, as a result of the pandemic, had an impact on the economy. Despite some indicators of economic recovery, there is still uncertainty about future economic growth, availability of capital, as well as the cost of capital, which could negatively affect the company's financial position, results of operations and economic prospects (N.S., Jiran, H., Gholami, S., Mahmood, M.Z.M., Saman, N.M.,Yusof, V., Draskovic, R. Javovic, 2019). Although the management and management of the companies are confident that they are taking appropriate measures to maintain the sustainability of the company in the current environment, an unexpected further deterioration could have a negative impact on the financial results and financial position of the company's industries.The experience of developed countries has shown that in the conditions of an unstable economic situation and heightened competition, the presence of an effective mechanism for monitoring the financial condition in a company becomes an essential condition for the stable and successful development of a company. Forming operational information on the basis of systematic analysis, monitoring provides the basis for making optimal management decisions, assessing their consequences even before implementation and predicting the further development of the organization.Crisis phenomena in the world economy require industrial enterprises to increase production efficiency, competitiveness, and effective forms of management and production management. An important role in the implementation of this task is assigned to monitoring the financial condition of enterprises, since it is one of the most effective methods for diagnosing the economic activity of enterprises. Analytical materials prepared during the monitoring process help to carry out a comprehensive analysis and forecast of the financial position of the enterprise and, thereby, to obtain a real assessment of the enterprise's capabilities. In Kazakhstan, the collection of information and analysis of the state of development of entrepreneurship and the business climate is carried out mainly according to the data of international rating agencies, which reflect indicators only at the republican level, as well as on the basis of the results of market surveys, which are one of the forms of statistical observations. But as a process of constant monitoring in order to identify the compliance of the development of entrepreneurship with the set tasks, it is practically not carried out either at the sectoral or at the regional levels.

Currently, in Kazakhstan, monitoring of the main financial and economic indicators of enterprises is carried out by various government agencies. The Committee on Statistics monitors the main indicators of large and medium-sized enterprises, prepares and publishes monthly statistical data characterizing the main indicators of the financial and economic activities of medium and large enterprises by type of economic activity: income from sales of products

and services, cost of goods sold and services rendered, non-production expenses, profit (loss) before taxation, profitability (loss ratio) of production. It also publishes monthly information on the state of mutual settlements of enterprises by type of economic activity, quarterly dynamics of accounts receivable and liabilities of large and medium-sized enterprises, dynamics of financial results, share distribution of enterprises that received income and loss for a certain quarter.Research conducted by government agencies allows to obtain mainly statistical data, analytical results characterizing the most important market indicators, and does not provide complete information to assess the financial condition of the enterprises under study, that is, the monitoring carried out by these organizations, the co-organizers, does not provide funding.Thus, for a more complete diagnosis, timely detection of crisis situations in the economy, external state monitoring of the financial condition of enterprises is required.At present, the state exercises only control over the bankruptcy procedure of insolvent enterprises. Analysis of trends at the enterprise level in the production of goods, services and aggregation at the macro level allows reinforcing dynamics and improving forecasting of macro indicators.

2. Literature review

According to the research of M.A. Batkovsky, P.V. Kravchuk (2019) the problems of creating a system for monitoring the activities of enterprises are due to the insufficient development of the scientific and methodological base for monitoring the activities of enterprises, since at present, there is no generally accepted concept of it, a unified terminology, etc., which reduces the effectiveness of monitoring in practice. When introducing a monitoring system for the activity of an innovatively active enterprise, the problem of determining the basic principles of creating this system is acute. Based on the analysis of various sources and practice of creating monitoring systems Yu.S. Shiryaeva, L.N. Pertseva, E.N. Lapshina, E.A. Lapshin (2017) propose to use principles that significantly increase the level of decision-making risk in the process of introducing a monitoring system at innovative-active enterprises.Many aspects related to the justification of assessment methods and ways to increase the potential of the enterprise are poorly studied and insufficiently researched. In this connection, there is a need to search for a methodology for assessing the economic potential of an enterprise that allows it to function effectively in market conditions (Dzhamay, 2017). According to M.A. Soldatova, L.E. Lazarenko, O.A. Stepanova (2015) industrial enterprises, especially those that are private property, carry out their activities not only in their own interests, but also in the interests of shareholders, which imposes certain requirements on the management system, including on the system for monitoring the economic condition, since it is precisely on the reliability and timeliness of providing information about the functioning of the enterprise depends on the effectiveness of management activities.The analysis of the main models for the formation of competitive advantages made it possible to formulate a hypothesis about the advisability of applying a systematic approach to assessing the factors influencing strategic behavior. The basis for modeling assessment methods is the field of monitoring the strategic potential, which consists of the coordinate planes of the assessment of elements that allow forming the strategic potential of industrial enterprises as the uncertainty of the business environment, the efficiency of the business network, and integration potential.V. Zhuravlyov, T. Khudyakova, N. Varkova, S. Aliukov, S. Shmidt (2019) improved and proposed model that determines the interdependence between the strategic management of investment policy and sustainable economic development of the company, which represents an algorithm for managing the process of developing investment strategies in industry. Many scientists propose methods for monitoring the sustainable development of industrial enterprises (P. Chowdhury, Paul Sanjoy, K., 2020). So, E.A.Tretyakova, T.V. Alferova (2016) proposed a methodology for assessing the level of sustainable development, implemented in the algorithm and a group of indicators of the enterprise. The calculation of single indicators of sustainable development in the economic, environmental and social spheres was carried out, then in statics - the determination of their normalized values, in dynamics - the calculation of the rate of their change and the construction of dynamic standards with their use. The calculation of group static and dynamic indices for each sphere and the calculation of integral static and dynamic

indices were made. Combining static and dynamic assessments made it possible to display the trajectory of movement of the positions of each of the enterprises in the matrix of complex assessment of the level of sustainable development of an industrial enterprise.Many scientists pay special attention to the analysis of information sources to assess the innovative potential, where they analyze the existing forms of statistical reporting and propose indicators that need to be obtained, where the decision-making methods that provide information, psychological, social and economic security of the information technology implementation process are taken as a basis (Bogatenkov, Belevitin, Khasanova, 2018). Many scientists propose methods for monitoring the sustainable development of industrial enterprises. So, A. Limp, A. Loureiro Rezende, A.Versian (2018) and A.N., Neculaesei, M., Tatarusanu, B., Anastasiei, N., Dospinescu, M.V., Bedrule Grigoruta, A.M. Ionescu, (2019) proposed a methodology for assessing the level of sustainable development, implemented in the algorithm and a group of indicators of the enterprise. H. Cuevas-Vargas, N. Parga-Montoya, R. Fernández-Escobedo (2016) in their research paid special attention to the analysis of information sources to assess the innovative potential, where he analyzes the existing forms of statistical reporting and offers indicators that must be obtained through a survey of companies.

Monitoring the financial condition is one of the most important functions of financial management to assess (analyze) the availability, placement and use of the company's financial resources. Monitoring is a mechanism for financial managers to constantly monitor the most important current results of the company's financial activities in the context of constantly changing market conditions. When forming a monitoring system, it is necessary to highlight the monitoring object, that is, the object being monitored in order to control its financial condition, and the monitoring subject, which will directly monitor and evaluate the results. The concept of "monitoring" entered the scientific literature relatively recently - at the beginning of the 70s. XX century this term has been studied for a long time in relation to environmental problems. The term "monitoring" was used in connection with the processing of information about the state of the environment as a system of observation and control over changes in the natural environment as a result of human economic activity. With the development of market relations in the post-Soviet space, works appeared on the problems of monitoring in the economic sphere.Monitoring is a means and methods of control and supervision over the course of any processes or commercial activities of an enterprise, carried out by an entrepreneur in order to stabilize production parameters".The study of the issues of monitoring the financial condition of enterprises was developed in the works of many authors, e.g. A.B. Rakhimbaev, E.E. Mikhel (2016).According to V.V. Kovalev (2015), monitoring is understood as continuous observation of economic objects, the analysis of their activities as an integral part of management. Such scientists as e.g. T. U. Turmanidze(2015),S. Hilkevics, V. Semakina, V. (2019) in their works also touched upon certain aspects of monitoring the financial condition of the company. In their opinion, monitoring the financial condition of a company is a system for monitoring, analyzing and evaluating the financial condition of a company in order to identify trends, forecast development prospects, prevent crisis situations and make optimal management decisions.

E.N. Barikayev (2015) notes that the main goal of monitoring the financial condition is the timely identification of trends in the financial condition of the company and the assessment of development prospects.
V. Akulov, M. Rudakov (2015) and V. Branichev (2018) highlight the main tasks of monitoring the financial condition of the company:
- determination of the main financial indicators of the company for a certain period and their trends;
- analysis and evaluation of the results obtained;
- assessment of the effectiveness of the company's financial policy;
- timely identification and analysis of negative trends in the company's financial condition, assessment of the company's financial risks;
- prevention of crisis situations;
- forecasting the company's activities;

- justification of recommendations and proposals for improving the financial stability of the company, identifying reserves.

So, from the position of V.P. Gruzinov, V.D. Gribov (2015) monitoring of the financial condition of an organization, assessment of its solvency are a prerequisite for the implementation of state policy aimed at preventing the bankruptcy of organizations (enterprises), at financial recovery and restructuring of insolvency.According to K.I. Polikarpov (2018) the concept of "monitoring" is much broader than the concept of "analysis". Monitoring includes analysis, as one of the main stages of its implementation. K. Zhakisheva (2018) believes that financial monitoring (monitoring of financial condition) is a system of continuous control and analysis of the financial condition and results of the organization's work.Soldatova, M., Lazarenko, L., Stepanova, O. (2015) consider financial monitoring as a system of continuous monitoring, analysis and forecasting of indicators of the financial condition of enterprises, formed at the macro- or microeconomic levels, in order to ensure the adoption of tactical and strategic management decisions at the appropriate level, as well as to assess the effectiveness of decisions.M.M. Berdar also did not distinguish between the concepts of "financial analysis" and "financial monitoring". They note that based on the results of monitoring studies of various aspects of the enterprise's activities, managers and owners have the opportunity to start developing a reflexive model for the financial recovery of the enterprise.From the position of T. Grynko, O. Krupskyi (2017) monitoring the financial condition of organizations is a system of continuous monitoring of the financial condition, including the prompt collection of information, analysis of key financial indicators and the adoption, based on the analysis results, of management decisions of a preventive and prophylactic nature.Many authors believe that monitoring the financial condition of an enterprise is the most important tool for anti-crisis management of an enterprise. Thus, scientists A. Abeldanova, Z. Smailova (2017), R. Berstembaeva (2017), D. Tleuzhanova, N. Yemelina, A. Omarova (2018) believe that the implementation of constant monitoring the financial condition of an enterprise is a prerequisite for early detection of the symptoms of a financial crisis.From the point of view of other authors, monitoring of the financial condition of an enterprise is a system of continuous monitoring, analysis and assessment of the financial condition of an enterprise based on key financial indicators in order to identify trends, forecast development prospects, prevent crisis situations and make optimal management decisions (A. Babaytsev, E. Kuznetsova, L. Rabinskiy, O. Tushavina, 2020).Thus, the monitoring system should have a signaling, warning character, the essence of which is to identify, as a result of systematic diagnostics of the financial condition, the likelihood of insolvency or bankruptcy of enterprises.

3. Research questions

Monitoring the innovative potential of industrial enterprises and their innovative activity in the context of the development of competition and globalization of world commodity markets is of particular importance for the future development of the industry and industry of the country as a whole. When monitoring enterprises, a large number of different economic and financial indicators are analyzed. Some of the indicators are accessible and determine the activities of companies and the industry as a whole. Access to other indicators requires the maximum transparency of enterprise management.

Developing policies to create the conditions for balanced, environmentally friendly growth requires an understanding of the drivers of economic development, with due regard to sustainability, economic and social well-being. Responsible policymakers need information to monitor progress, plan future directions and evaluate results. Information, reflecting internationally comparable data and indicators, serves as a basis for developing new policies and promoting ideas and strategies.

Kazakhstan's introduction of a methodology for measuring and monitoring the progress of industrial enterprises allows for increased international cooperation, which means the dissemination of knowledge, exchange of

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

information and the development of common approaches to sustainable growth. Effective monitoring and evaluation requires more than data. It is also necessary to build institutional capacity, clarify the functions of various government structures, create new state bodies as necessary and support research activities at the national level within the framework of policy priorities and measures for the development of industries in the Republic of Kazakhstan. Research questions raised in the paper are presented graphically below (see Figure 1).

4. Analysis and results of the research

At present, industry occupies almost one third of the structure of the economy of Kazakhstan. A high share of the mining sector provides more than 2.5% of employment and an average of 26.6% of GVA in the economy (Table 1).

Investments in fixed assets in the extractive industry today account for more than 30% of the total, and in the manufacturing industry only 12% (Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan). Kazakhstan, which is a leading exporter of extractive industry products (primarily due to the export of extracted oil), is ahead of all CIS countries in terms of per capita export. However, the average per capita export of manufacturing products in the Republic of Kazakhstan is relatively low - approximately two times lower than in Russia.At the end of 2019, compared to 2014, Kazakhstan shows a positive growth trend in terms of the main indicators: GDP grew by 75.3%, including industry - by 58.6%, construction - by 66.2%, agriculture, forestry and fisheries - by 63.9%, the volume of innovative products - 2.0 times, the energy intensity of GDP decreased by 13.6% (Table 2).

Table 2. Dynamics of the main indicators by the main target indicators for 2014-2019

Economy of the Republic of Kazakhstan is one of the fastest growing in the CIS. The observed growth was largely due to large foreign investors in the oil and gas industry, the expansion of which had a positive impact on other industries. However, economic growth is still largely dependent on the growth of oil and gas production in Kazakhstan, as well as the global market conditions for these products (Official site of JSC "National Managing Holding "Baiterek ").

Kazakhstan ranks roughly 50th in the list of countries in terms of nominal gross domestic product. In 2018, the GDP of Kazakhstan amounted to 61.8 trillion tenge (3.4 million tenge per capita, or 9812.5 US dollars). For 9 months of 2019, the GDP of Kazakhstan amounted to 44.3 trillion tenge. The estimate of Kazakhstan's GDP for the full year of 2019 is 67.7 trillion tenge (Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan).

Figure 2. Analysis of GDP dynamics in Kazakhstan for the period from 2002-2019
Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

In connection with the raw materials orientation and export orientation of the economy of Kazakhstan, its development is closely related to the situation in the market of raw materials, primarily oil and metals. From 2000 to 2011, Kazakhstan's GDP showed rapid real growth at double-digit levels with short-term adjustments in 2008-2009 due to the impact of the global financial crisis. From 2012 to 2014, the country's growth rates have stabilized at the level of 4-6%. Such dynamics of growth rates is explained by the significant consolidation of the country's economy against the background of high prices for oil and metals. In 2015-2016 there was a drop in GDP growth to 1.2 and 1.1%, respectively, as a consequence of the collapse in oil prices. At the same time, since 2017, there has been a recovery in economic growth indicators in Kazakhstan - slightly above 4% (Figure 2).

At present, industrial production in the structure of Kazakhstan's GDP is 44%. The volume of industrial production in monetary terms amounted to 27.2 trillion tenge. In the structure of industrial production, the leading positions are occupied by the mining and manufacturing industries - 54% and 38%, respectively (Figure 3).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

Industrial production volumes since 2000 to 2015 increased annually by an average of 20%, but in 2015 there was a sharp decrease of 21% in relation to 2014.
The main reasons for the decline were the following factors:
- production volumes in the mining industry decreased by 33%;
- in the manufacturing industry decreased by 6%;
- in the field of electricity, gas, steam and air conditioning, production increased by 4%;
- in the sector of water supply, sewerage system, control over the collection and distribution of waste, production increased by 3%.
Figure 3. Structure of industrial production in Kazakhstan, in %
Source: compiled by authors according to the source Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

Since 2016 the volume of industrial production began to recover due to the increase in production volumes in all sectors. Thus, the average annual growth since 2016 is 22%. Business susceptibility to technological innovation remains low, but is growing moderately. In 2019, the share of innovatively active enterprises amounted to 7.3% of the total number of industrial enterprises, which is significantly lower than the values typical for Germany (73%), Ireland (61%), Belgium (58%), Czech Republic (41%) (Official site of Eurostat, 2019.). Qualitatively, the insufficient level of innovative activity is aggravated by the low return on the implementation of technological innovations. The expenditures of Kazakhstan companies on R&D (in% of GDP) remain extremely low 0.3% of GDP, which is even lower than the indicators of Russia 1.4%, Ukraine 0.9% and Belarus 0.7% (Official site of Eurostat, 2019). In addition to the "quantitative" lag of Kazakhstan companies in terms of innovation activity, there are significant structural problems in organizing innovation management at the company level.

The share of products of Kazakhstan companies in the global export of high-tech civilian products is zero. The reasons for the persistently weak positions of Kazakhstan companies are the lack of high-quality scientific research close to production and weak competencies and visions at the level of company leaders, who save on development, postponing innovative projects and R&D costs for an indefinite future.

In Kazakhstan, the dependence of the state budget on revenues from oil exports continues to grow. Oil revenues account for more than 50% of the consolidated revenues of the state, and the budget deficit, excluding these revenues, reaches 9.3% of GDP. The transfer of the National Fund of the Republic of Kazakhstan provides financing for almost a fifth of all government spending.

Kazakhstan has come close to the problem of the "middle income trap". Upon reaching a certain level of well-being in the range from 10 thousand to 15 thousand US dollars of GDP per capita, the growth of the economy of the Republic of Kazakhstan may slow down. The economy may lose competitiveness and turn out to be a country with a low level of income. As the global experience of economic development shows, few countries manage to overcome the threshold of middle income: of more than 100 countries that quickly reached middle income half a century ago, only about a dozen have managed to become high-income countries. The main strategy for breaking through the "trap" is the accelerated development of industry, including manufacturing.

Thus, starting from 2010 to the present, the foundations of modern industrial policy in the Republic of Kazakhstan were laid. The main regulatory legal acts were adopted; various instruments for supporting industrial development and new policy directions were tested. In particular, mechanisms were launched to attract foreign direct investment and support exports, and the process of transforming special economic zones was launched. Diversification of the economy has begun through the accelerated development of the manufacturing industry, an increase in non-resource exports and the attraction of foreign direct investment in non-resource sectors. The production of more than 150 new types of products has been mastered. These are high-tech products of mechanical engineering, pharmaceuticals and chemical industries.

In modern conditions, when entrepreneurial activity is aimed at improving management mechanisms, at creating competitive advantages, it is necessary to analyze the activities of companies to identify hidden reserves and prevent possible financial threats. In a market economy, there is an objective need to identify trends in the development of the financial condition and prospective financial capabilities of the enterprise.

In this regard, the monitoring of the financial condition is carried out, which is aimed at assessing the condition of the objects under study in conditions of insufficient information in order to identify problems in the functioning of systems and the causes of their occurrence, where the assessment of the company's performance is an important part of the analysis of the company's financial condition within the framework of monitoring. In this regard, let us consider the main indicators of the financial and economic activity of industrial enterprises in 2013-2018 (Table 3).

Table 3. Main indicators of financial and economic activity of industrial enterprises in 2013-2018 (in mln. tenge)

Indicators	2013	2014	2015	2016	2017	2018
Profit (loss) before taxes

Source: compiled by authors according to the source Official site of the Development Bank of Kazakhstan

Based on Table 3, it can be seen that the main share in all indicators is occupied by the mining industry and quarrying, so the income from product sales in 2018 compared to 2013 increased by 37.5% due to an increase in the average selling price and amounted to 13 317.6 billion tenge. In the manufacturing industry, income grew by 72.7%, reaching 8,446.9 billion tenge.

5. Application functionality

With the help of regression analysis, we will analyze the influence of the presented indicators of financial and economic activity of the mining industry and the development of quarries and the manufacturing industry on their profit. As a result of the analysis of the main indicators of financial and economic activity of industrial enterprises of the Republic of Kazakhstan, it was revealed that the main share in all indicators is occupied by the mining industry, quarrying and manufacturing. Therefore, for further comparative analysis of the two industries under consideration, authors set the task to show the difference between the formation of pre-tax profit by increasing income, which is necessary for more efficient cost management in the studied industries. For this, regression analysis was used using the least squares method, which made it possible to analyze the impact of the presented indicators of financial and economic activity in the mining industry, development of quarries and the manufacturing industry on their profit.

As explanatory factors, income from sales of products and debt on liabilities were selected, which, as a result of comparing the two industries under consideration, showed a significant difference between the formation of pre-tax profit by increasing income. The analysis of the monitoring showed that more efficient cost management is carried out in the mining and quarrying industries compared to the manufacturing industry. This indicates that monitoring the innovative potential of industrial enterprises and their innovative activity is of particular importance for the future development of the industry. In this regard, the monitoring of the financial condition is carried out,

which is aimed at assessing the condition of the objects under study in conditions of insufficient information in order to identify problems in the functioning of systems and the causes of their occurrence, where the assessment of the company's performance is an important part of the analysis of the company's financial condition within the framework of monitoring. Based on the analysis of the financial results of industrial enterprises, their business and market activity, it follows that the main attention of the financial management of enterprises should be paid to increasing the operating and net profit of the company, and due to this, the indicators of the company's profitability. As a result, authors formulated conclusions and recommendations for improving monitoring of the activities of industrial enterprises of the Republic of Kazakhstan, since the importance of monitoring affects the high rating of enterprises, allows them to have financial and economic advantages in the market of credit resources and investment funds, to receive promising government orders, to consistently increase the value of the enterprises themselves and their securities.

For this, the following hypotheses were formulated:
1. Analyzing the impact of indicators of financial and economic activities (income from sales of products and debt on obligations) of the mining and manufacturing industries on their profits.
2. Based on the analysis of the financial condition of industrial enterprises, predicting the indicators of production volumes and profitability of industrial enterprises, namely:
- forecast of the volume of investments in fixed assets of the industry;
- forecast of profitability;
- forecast of the amount of profit (loss) before tax.
3. Formulating conclusions and recommendations for improving monitoring of the activities of industrial enterprises of the Republic of Kazakhstan, which affects the financial and economic advantages in the market of credit and financial resources.

After assessing the statistical significance of the variables, income from sales of products and debt on obligations were chosen as explanatory factors.To build an econometric model, the statistical data of these indicators were used for the period from 2013 to 2018. The results of the regression analysis carried out using the least squares method are shown below (Table 4).

Table 4. Results of evaluating the pre-tax profit equation for mining and quarrying

variable is explained by the resulting regression. The equation as a whole, as well as its individual parameters, is statistically significant and reliable with a 95% probability.

The analysis of the obtained parameters of the multiple linear regression equation allows us to draw the following conclusions for mining and quarrying enterprises:
1) with an increase in income from the sale of products and the provision of services by 1 million tenge, profit before tax increases on average by 0.810 million tenge;
2) with an increase in debt on liabilities by 1 million tenge, profit before tax decreases on average by 0.057 million tenge (Table 5).

Table 5. The results of evaluating the equation of profit before tax for the manufacturing industry

R	0,894
R^2	0,799
Adjusted R^2	0,664
The observed value of the Fisher test	5,950
Critical Fisher's criterion	5,462 ($\alpha = 0,1$, $k_1 = 2$, $k_2 = 3$)
Variables	
Profit before tax (million tenge) - dependent variable	
Constant	-1559717,961*
	Regression coefficients
Income from the sale of products and the provision of services	0,455*
Debt on obligations	-0,085*
* p<0,1; ** p<0,05; *** p<0,01	

Source: compiled and calculated by authors

The multiple correlation coefficients indicate a close relationship between the resulting trait and two factorial traits at the same time, and the corrected determination coefficient indicates that 66.4% of the variation in the dependent variable is explained by the resulting regression. The equation as a whole, as well as its individual parameters, is statistically significant and reliable with a 90% probability. The resulting multiple linear regression equation allows us to draw the following conclusions for manufacturing enterprises:
1) with an increase in income from the sale of products and the provision of services by 1 million tenge, profit before tax increases on average by 0.455 million tenge;
2) with an increase in debt on liabilities by 1 million tenge, profit before tax decreases by an average of 0.085 million tenge.

Thus, a comparison of the two industries under consideration showed a significant difference between the formations of pre-tax profit by increasing income. So, with an increase in income by 1 million tenge, profit in the mining industry and quarrying increases by an average of 810 thousand tenge, while in the manufacturing industry by only 455 thousand tenge. This may indicate more efficient cost management in the mining and quarrying industries compared to the manufacturing industry.

Trade and other receivables from related parties represent primarily amounts related to export sales. Trade receivables from manufacturing enterprises amounted to 2,184 billion tenge in 2017 and 2,249.6 billion tenge in 2018, with an increase of almost 2 times. In the mining and quarrying industries, there is also an increase of 6.6% or for 91bn. tenge. The size of the companies' liabilities also doubled in 2018 compared to 2013, reaching the level in the mining industry of 9,375.1 billion tenge and processing 8,455.6 billion tenge. Based on the analysis of the

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

financial results of the studied company, its business and market activity, it follows that the main attention of the financial management of the company should be paid to increasing the operating and net profit of the company, and due to this, the indicators of the company's profitability.

The main growth factors for these indicators are:
- increase in production, decrease in production;
- operating costs of the company;
- management of the turnover of current assets.

The analysis of the financial condition of industrial enterprises allows us to move on to the next stage of monitoring the financial condition of the company, forecasting the main parameters of the company. When forecasting, long-term plans for the development of the company are developed and indicators are calculated, on the basis of which it is possible to assess the financial condition of the company or individual aspects of its financial and economic activities. The starting point for developing a long-term plan of income and expenses is the forecast of volume sales in kind and in value terms. The main tool for any forecast is the extrapolation scheme. The essence of extrapolation is to study the stable trends in the development of the forecast object that have developed in the past and the present and carry them over to the future. Extrapolation methods are the most widespread and well-developed. The basis of extrapolation forecasting methods is the study of time series. A time series is a set of observations obtained sequentially in time. Let us illustrate the use of this method by the example of forecasting the profitability and the indicator of the volume of industrial production in the Republic of Kazakhstan. To carry out the calculations, we will use the time series data for the period 2013-2018, presented in Table 6.

Table 6. Forecast of the volume of production and profitability of industrial enterprises,%

Source: compiled and calculated by authors

We will smooth the time series using one of the main methods of regression analysis - the least squares method. As a result, we obtain a linear trend dependence of the form (Figure 4, 5, 6):

Figure 4. Forecast of the volume of investments in fixed assets of the industry, million tenge
Source: compiled and calculated by authors
Figure 5. Forecast of profitability, in %
Source: compiled and calculated by authors

The forecast data show that the profitability of the industry by 2023 will grow to 40.5%. The growth will occur mainly due to the extensive factor - the growth in the volume of investments in fixed assets of the industry, which over the same period will grow almost 2.5 times.

For a more complete diagnosis, timely identification of crisis situations in the economy, external state monitoring of the financial condition of enterprises is required (Savitskaya, 2013). At present, the state exercises only control over the bankruptcy procedure of insolvent enterprises (Govorova, 2016).

In modern conditions, the problem of financial insolvency of enterprises is very relevant, therefore, it is necessary to introduce assessment systems for these enterprises, which could serve as indicators of the success of their activities, reflect the degree of attractiveness for investors, and be an internal incentive for the development of enterprises themselves.

In this connection, the main functions of monitoring the financial condition of the company should be:

- analytical function, which assumes, on the basis of constant monitoring of the object, the analysis of its financial condition, which includes the measurement of real results and their correlation with the set goals, standards, and norms;

- diagnostic, implying the interpretation of the results obtained and allowing an objective assessment of the results of the analysis of the monitoring object;

- function of forecasting, is to develop long-term changes in the financial condition of the company;

- organizational and managerial, involving control over the state of the monitoring object and preparation of recommendations for making corrective and proactive managerial decisions.

In terms of profitability indicators, the most indicative is the ratio of the amount of net profit to own capital, since it shows how effectively the shareholder capital invested in the enterprise is being used. Also the most important is the rate of return on assets (resource productivity), which characterizes the intensity of the use of the company's assets for the production of products.

To monitor the financial condition of strategic enterprises at the state level, the following system of indicators is proposed:

- degree of solvency for current obligations;

- current liquidity ratio;

 - ratio of debt and equity funds;

- ratio of provision with own funds;

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

- ratio of stocks provision with own circulating assets;
- return on assets;
- return on equity.
In order to identify problems in the functioning of systems and the reasons for their occurrence, the need to monitor the financial condition of enterprises is obvious. The analysis carried out and the results obtained showed that the main focus of the financial management of enterprises should be aimed at increasing the operating and net profit of the company.

On the basis of forecasting indicators of production volumes and profitability of industrial enterprises, authors formulated conclusions and recommendations for improving monitoring of the activities of industrial enterprises of the Republic of Kazakhstan, contributing to the creation of conditions for balanced, environmentally-oriented growth, understanding the factors contributing to economic development, with due regard for the problems of sustainability, economic and social well-being.
The obtained results of the study indicate that monitoring the innovative potential of industrial enterprises and their innovative activity is of particular importance for the future development of the industry.

The proposed system of indicators for monitoring the financial condition of strategic companies, should be carried out at the state level, will reduce the risk of insolvency, bankruptcy of these companies, and most importantly, the risk of negative impact of the deterioration in the financial condition of strategic companies on the country's economy as a whole. In this regard, monitoring the financial condition of strategic companies will facilitate the timely detection of signs of significant deviations from normal economic development and, thereby, provide a real opportunity for the government and company management to take measures to prevent crisis situations.

5. Conclusion

When monitoring industrial enterprises, a large number of various economic and financial indicators are analyzed, some of which are available and determine the activities of companies and the industry as a whole. Access to other indicators requires the maximum transparency of enterprise management.
An analysis of the set of indicators used, which are compiled on the basis of a limited set of formal indicators, cannot give a complete picture of the situation of an enterprise. There are also a number of criteria that are difficult or even impossible to capture using quantitative indicators. These informal criteria can significantly affect the assessment of the effectiveness of enterprise management.
At present, the existing monitoring theory does not fully and adequately reflect the features of its development at the present stage, including its role in the process of managing the enterprise's activities. The results of the study, presented in this article, indicate the existence of feedback, information, instrumental and organizational support in the monitoring system. It should also be noted the implementation of its coordinating and integrating functions, which are implemented in the management process. The need to integrate management functions is due to the requirement for their operational adaptation, as well as ensuring the effective functioning of industrial enterprises in modern dynamic conditions.
We would also note that in the context of digital transformation, the way to control the processes at the enterprise is changing. The interaction of IT and business is becoming closer - it is necessary to control technological and business processes at the same time. Universal monitoring systems organize a single point for collecting data of various types from various sources and notify about events that must support:
- multifunctionality - access to monitoring a wide range of parameters;
- integration - support for many protocols and technologies for data collection;

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

- availability;
- reporting - flexible reporting system with different levels of detail;
- notifications — configure the delivery methods for event notifications.

Thus, the monitoring system of industrial enterprises is the interaction of accounting, planning, control, regulation and analysis processes, taking into account the priority areas and development goals of the enterprise, through instrumental, methodological, organizational and information support.

MEASURING MULTIDIMENSIONAL POVERTY WITHIN THE RESOURCE-BASED APPROACH: A CASE STUDY OF LATGALE REGION, LATVIA

Vladimirs Mensikovs [1], Irena Kokina [2], Vera Komarova [3], Oksana Ruza [4], Alina Danilevica [5]

[1,2,3,4,5] Daugavpils University, Parades Str.1, Daugavpils, LV-5401, Latvia

E-mails: [1]vladimirs.mensikovs@du.lv, [2]irena.kokina@du.lv, [3]vera.komarova@du.lv, [4]oksana.ruza@du.lv, [5]alina.danilevica@du.lv

Abstract. In modern social science, the concept of multidimensional poverty is considered the most progressive approach to measuring poverty in countries of various development levels, including the developed ones. As an indicator of poverty in the EU, the multidimensional index of the risk of poverty and social exclusion (AROPE) is used, which integrates the indicators of income poverty, material deprivation and exclusion from the labour market. The empirical basis for its calculation is the data of the survey "Statistics of income and living conditions in the EU" (EU-SILC), published by the statistical office of the European Union. Within the framework of this article, the authors tried to contribute to the theoretical and methodological basis for studying the issue of multidimensional poverty by measuring and analysing it within the framework of the resource approach using the empirical data collected by the authors in one of the peripheral regions of Latvia - Latgale, which for many years has had the lowest indicators of economic development in the country. The resource-based approach is founded on the following methodological path: resources available for the people and households can be transformed into capital as a result of its activation and capitalization that, in its turn, can give the person socially economic benefit, i.e., a resource becomes a capital. The methodology of this study involves the application of new concepts: the "resource-poor" (few resources) and the "functional-poor" (low capitalization of available resources), as well as the "resource-functional poor", who, according to the authors, represent different target groups for the social policy, since they fundamentally differ in terms of both the causes of poverty and the approaches to supporting these groups.

Keywords: multidimensional poverty; resource-based approach; Latgale region; resource-poor; functional-poor; resource-functional poor

1. Introduction

Poverty is a multidimensional concept. A European definition was agreed first by the European Council back in 1975: "People are said to be living in poverty if their income and resources are so inadequate as to preclude them from having a standard of living considered acceptable in the society in which they live. Because of their poverty they may experience multiple disadvantages through unemployment, low income, poor housing, inadequate healthcare and barriers to lifelong learning, culture, sport and recreation. They are often excluded and marginalised from participating in activities (economic, social and cultural) that are the norm for other people and their access to fundamental rights may be restricted" (Eurostat 2013).

For quite a long time, when analysing social stratification in their countries, the researchers of the Baltic states paid great attention to the formation of the middle class, while the poor groups of the population were considered as its possible reserve, which, according to certain criteria, did not reach the role of a reliable stabilizer in conditions of complex societal transformations (Zickute 2013; Menshikov 2016; Taljūnaite, Sviklas 2018; Voronov, Ruza 2018; Swedbank 2018; Neverauskiene 2020; Kaźmierczyk 2018). However, the share of these poor groups turned out to be quite large, and after the global financial crisis in 2008 it made more than 90 percent in Latvia (Menshikov 2016). The largest gap between the candidates for the middle class and poor groups was in terms of money income, but there were also significant differences in such assessed parameters as education level and self-identification with the middle class (Menshikov 2016).

All this makes researchers to study more deeply the indeed numerous groups of poor population and propose new approaches to understanding, measuring and overcoming it. In particular, it became possible to use the concept of multidimensional poverty in the search for solutions to these problems, which has been steadily receiving much attention in scientific publications over the past decades (Betti, Verma 2008; Berenger et al. 2009; Esposito, Chiappero-Martinettix 2010; Alkire, Fang 2019; Yang et al. 2019). An initiative group of scientists from Oxford University studying poverty and human development has developed a deprivation-based Multidimensional Poverty Index (MPI), which is now widely used by international research organisations in their statistical reviews and reports (Alkire 2008, 2015; Kakwani, Silber 2008; Chakravarty et al. 2008; European Commision 2012; Alkire et al. 2017; Betti et al. 2018, OPHI, UNDP 2019, 2020). It was originally developed for India, but the analysis of the scientific literature shows that in recent years it has been calculated for many countries, including the developed ones (Betti et al. 2015; Alkire, Fang 2019; Ciani et al. 2019; Mitra, Brucker 2019). Despite its multifacetedness and topicality, the problem of multidimensional poverty is rather poorly highlighted in the Baltic states.

Within the framework of this article, the authors, firstly, will analyse the existing approaches to measuring multidimensional poverty and their results, and secondly, will try to contribute to the theoretical and methodological basis applied for studying the issues of multidimensional poverty, having measured and analysed it within the framework of the resource-based approach (Tikhonova 2006; Boronenko, Drezgic 2014) with the use of empirical data collected by the authors in one of the peripheral regions of Latvia - Latgale, which for many years has had the lowest economic development indicators in the country.

2. Review of literature and statistics

The authors based their analysis of scientific publications on the study of the dynamics of publishing the articles containing the term "multidimensional poverty" in their titles. The analysis of the frequency of using this term in the titles of publications indexed by the SCOPUS database showed that the interest of researchers in the problem of multidimensional poverty is growing every year, as indicated by an increase in the number of articles related to

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

this topic in the period from 2002 to 2019. During this period, a relative surge in publications related to multidimensional poverty was observed in 2008 (10 publications), having gradually peaked in 2019 (78 publications) after a five-year decline (see Figure 1).

Figure 1. The number of publications related to multidimensional poverty indexed by SCOPUS, 2002-201
Source: compiled by the authors from the data of SCOPUS.

At different times, different authors have written about multidimensional poverty, and judging by the selected scientific publications, there are quite few who have dealt with this problem for at least several years (see Figure 2).
Figure 2. The number of publications related to multidimensional poverty, by authors, 2002-2019
Source: compiled by the authors from the data of SCOPUS.

One of the first approaches to the study of multidimensional poverty, i.e. the basic-needs strategy, was announced in August 1976 at the International Conference on Employment, organised by the International Labour Organisation (Grant 1977). Within the framework of the concept of basic needs, in addition to material needs that determine the possibility of simple physical survival, services that are necessary for the successful social activity of people are added. Measuring the level of poverty within the framework of this concept is based on the absolute poverty line, however, in addition to expenses on food, the expenses on education, leisure, and healthcare are also taken into account (Streeten et al. 1981).

The concept of basic needs was criticised by the British sociologist P. Townsend. His main argument was that despite the active debate over what to include in the set of necessary means of subsistence, the poverty line calculated on the basis of these data will not make sense, because, according to the scientist: "People will spend money on other things" (Townsend 2010). The main conclusion of P. Townsend was the formulation of the concept of poverty as a relative deprivation: people are rich or poor in relation to what share of the resources available to all members of society is available to them (Townsend 2010). To determine the extent of poverty according to this concept, the relative monetary poverty line is used, which makes 40-60% of the median income of the population of the surveyed country.

Commenting on the works of P. Townsend, A. Sen writes that although, according to P. Townsend, there is no concept of "absolute needs", and the needs of people for material goods in different societies are different, this is true only for material goods. However, the very essence of people's needs is absolute, the thing is that in different societies these needs are satisfied with the help of a different set of goods, since different societies have different capabilities. According to A. Sen, absoluteness always lies at the basis of any relativity (Sen 1983).

S. Alkire (Oxford Poverty & Human Development Initiative, OPHI) and J. Foster (The George Washington University) have made a great contribution to the development of conceptual problems and methods for measuring multidimensional poverty. The method they have developed for measuring multidimensional poverty is called the Alkire-Foster method. This method makes it possible to determine by what parameters a certain share of the population can be considered the poor, as well as to aggregate information to reflect poverty in society (by geographic region, ethnic and other characteristics of social groups). The indicators constructed using this method allow us to identify the interconnection between the types of deprivation and can be used in the development of social policy priorities (Foster et al. 1984; Alkire, Foster 2007; Alkire 2008, 2015; Alkire et al. 2017; Samuel et al. 2018; Alkire, Fang 2019).

A great contribution to the study of multidimensional poverty was also made by the scientific publications of J. Silber with his associates. Their articles dwell upon the study of the main challenges faced in applying a multidimensional approach to poverty and provide an overview of solutions that have not yet been proposed to address these challenges. J. Silber and his co-authors consider the main ordinal approaches to measuring multidimensional poverty (Chakravarty et al. 2008; Kakwani, Silber 2008).

In turn, G. Betii's research provides a step-by-step report on how the instruments for measuring non-monetary deprivation as well as monetary poverty can be built at the regional level. The publications by G. Betii and his colleagues present a practical methodology for estimating variance for multidimensional indicators of poverty and deprivation of households and individuals, obtained from sample surveys with complex designs and rather large-size sampling (Betti et al. 2015; Betti et al. 2018; Ciani et al. 2019)

Multidimensional poverty embraces aspects of human life that cannot be measured using value indicators: health, education, living conditions, personal security, enforcement of rights and opportunities, etc. A household may have an average income, though lack drinking water, lack access to quality health and education services, have no decent work, live in a region with a high crime rate and / or an environmentally unfavourable region. In this case, the person experiences deprivation - "a situation in which you do not have things or conditions that are usually considered necessary for a pleasant life" (Cambridge English Dictionary 2020).

The use of multidimensional poverty indicators in official statistics is a fairly new progressive practice. The concept of multidimensional poverty has replaced the income poverty criteria, which have been used for a long time as indicators of the socio-economic situation of citizens by the official statistical bodies of various countries, international organisations and individual researchers. Currently, the academic environment has developed an awareness that in modern economically developed societies the concept of poverty cannot be limited only to income criteria. The multidimensional approach to the definition of poverty takes into account not only the lack of financial resources of an individual, but also his limitations in access to education and healthcare, as well as difficulties associated with housing conditions, food, health and other subsistence needs.

Multi-criteria poverty index AROPE[*] used in European official statistics is complex and aggregates information on three poverty criteria. According to the methodology for constructing the AROPE index, persons who have at least one of the following three indicators of poverty are acknowledged to be poor (Eurostat 2020a):

− *Risk of relative income poverty*. The AROPE index uses the concept of relative poverty to determine the risk of income poverty. A person is considered poor if he/she lives in a household where per capita disposable income is below 60% of the median income of the country's population. The per capita disposable income of household members is calculated as follows: the monetary income of all household members, net of taxes and social security contributions, are summed up and divided by the equivalent number of household members. The equivalent number of household members is determined according to the OECD scale. According to this equivalence scale, household members are assigned weights: 1 for the first adult; 0.5 for the second and subsequent adults (aged 14 years and older); 0.3 for each child (aged 0-13).

− *The presence of severe material deprivations*. One is acknowledged as experiencing significant material deprivation if, due to insufficient funds, one cannot afford at least four out of the following nine points:
1) to pay off arrears of housing, utility bills, loans;
2) to have at least one week's holiday away from home annually;
3) meals containing meat, chicken, fish (or vegetarian equivalent) at least every other day;
4) home heating;
5) unexpected expenses;
6) a telephone;
7) a colour TV;
8) a washing machine;
9) a personal car.
After 2015, 4 more points were added making it total of 13 deprivations to be taken into account:
10) to spend a small amount of money on oneself every week;

---

[*] At risk of poverty or social exclusion, abbreviated as AROPE, corresponds to the sum of persons who are either at risk of poverty, or severely materially deprived or living in a household with a very low work intensity (Eurostat 2020a).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

11) to have money for regular leisure / recreation activities;
12) to pay for Internet connection;
13) to get together with friends / family at the table at least once a month.

− *Exclusion from the labour market*. The indicator of exclusion from the labour market reflects low work intensity of working-age people. A person is considered excluded from the labour market in the past year if the ratio of the total number of months worked by all members of his household aged 18 - 59 to the sum of all possible months of work is less than 0.2.

For the empirical calculation of the multi-criteria poverty index AROPE, the database of the EU Statistics of Income and Living Conditions (EU-SILC) is used (Eurostat 2020b). As mentioned above, according to the AROPE methodology, three poverty criteria are determined for each individual, namely, the risk of relative income poverty, the presence of material deprivations and exclusion from the labour market. Thus, a person can be poor according to only one criterion (which is already a sufficient condition for being acknowledged as poor according to AROPE), as well as according to two or three criteria simultaneously.

Figure 3 shows the distribution of the EU population classified as poor according to various criteria of the multi-criteria poverty index AROPE. The greatest contribution to the level of multidimensional poverty is made by the risk of income poverty - 73.8 million people. Meanwhile, for 47.0 million of the poor in terms of income, this risk is the only criterion of poverty, while the remaining 26.8 million, experiencing the risk of income poverty, are simultaneously poor according to one or two other criteria. 26.7 million people in the EU acknowledged to be poor are experiencing severe material deprivation and 28.2 million of the poor are excluded from the labour market. According to the AROPE methodology, the smallest part of the poor are people who are simultaneously experiencing severe material deprivation and are acknowledged to be excluded from the labour market - 1.4 million people. The number of those EU residents who are acknowledged to be poor according to all three criteria of the multi-criteria poverty index AROPE is 5.7 million people.

In 2018, 94.8 million people, or 21.6% of the EU population (without the UK), were at risk of poverty or social exclusion, a decrease of 12.5 million people, or 3 percentage points, since 2013 (European Commission 2020). The Europe 2020 strategy's goal to "lift at least 20 million people out of the risk of poverty or social exclusion" by 2020 compared with the year 2008 (European Commission 2010 (2020)) is based on the EU's composition at the time the strategy was adopted: including the United Kingdom, but excluding Croatia. In 2018, there were 108.9 million people in the EU (with the UK, but without HR) at risk of poverty or social exclusion, which is a decrease of 7.2 million people compared with 2008. It is worth noting that the EU's at-risk-of-poverty-or-social-exclusion rate increased between 2009 and 2012 because of the delayed social effects of the economic crisis, but it has been in decline since that period. However, with 12.8 million people still needing to be lifted out of the situation of being at risk of poverty or social inclusion, the EU is likely to miss its 2020 target (European Commission 2020).

In Latvia, the AROPE index has been used to measure multidimensional poverty since 2005, as part of the process of modernization of the social statistics of the European Statistical System (including the EU-SILC survey) (Central Statistical Bureau of Latvia 2018). As V. Veretjanovs, the Senior Expert of Social Statistics Methodology Section of Social Statistics Department of the Central Statistical Bureau of Latvia (EU-SILC survey manager) stated, EU-SILC is based on the idea of a "common framework" in contrast with the concept of a "common survey" (Central Statistical Bureau of Latvia 2018). Some of the results of applying AROPE to measure poverty in Latvia for different age groups of the population are presented in Table 1.

Table 1. At-risk-of-poverty rate* in Latvia, % of total population, 2004-2016

Age/ year	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Latvia, total	19.4	23.5	21.2	25.9	26.4	20.9	19.0	19.2	19.4	21.2	22.5	21.8	22.1

Source: Central Statistical Bureau of Latvia 2018.

* At-risk-of-poverty rate is the monetary part of AROPE – the share of persons with an equivalised disposable income below 60% of the national median equivalised disposable income.

As concerns material deprivations, the most common type of deprivation in general in the EU is the inability to cope with unexpected financial expenses. This deprivation was experienced by 32.5% of the population of the European Union in 2018 (Eurostat 2020c). Having analysed the data for the Baltic states, it can be noted that this deprivation was experienced most in Latvia - 55.3% of the population, in Lithuania - 48.8%, in Estonia - 34.7%. This means that half of the people in Latvia and Lithuania cannot afford unexpected expenses. Another common type of deprivation is an annual week's holiday away from home. In the EU, 28.5% of the population is deprived of this opportunity, in the Baltic countries: 40.7% in Lithuania, 32.8% in Latvia, and 26.9% in Estonia. Every seventh EU resident (8.9%) has mortgage or rent arrears, utility bills or instalment purchases, 7.3% cannot provide sufficient heating for their homes, the same number is unable to make ends meet, 7% cannot allow themselves meals with meat, chicken, fish (or the vegetarian equivalent) every other day. Having compared the Baltic countries, it can be noted that the percentage of the population experiencing all kinds of deprivation in Latvia is higher than in

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Lithuania and Estonia. Only the percentage of deprivation of heating in Lithuania is almost 4 times higher than in Latvia, and 14 times higher than in Estonia (Eurostat 2020c).
Figure 4 shows the distribution of the Baltic states population acknowledged to be poor according to all three criteria of the multi-criteria poverty index AROPE: in 2018, there were 74 thousand such people in Lithuania, 34 thousand in Latvia, and 8 thousand in Estonia.

Figure 4. Baltic states population acknowledged to be poor according to all three criteria of the multi-criteria poverty index AROPE, thousand people, 2009-2018
Source: compiled by the authors from the data of Eurostat 2020c.

Thus, in Latvia and Lithuania, the level of multidimensional poverty is the highest among the Baltic states and therefore deserves special attention of researchers. As already noted in the Introduction, for the purpose of methodological testing the authors of this article will consider the case of only one peripheral region of Latvia, the poorest one during many years.

As the authors' analysis of European statistics has shown, two sub-groups of the poor population - "poor in terms of income" and "poor in terms of deprivation" - overlap less and less over time, although the situation of each of them remains rather difficult. For this reason, the use of only one of the two basic theoretical and methodological concepts for the analysis and understanding of poverty as the main one seems impossible, since it leads to the loss of a significant part of the poor population as the subject of analysis.

3. Research methodology

As the experts of the European Anti-Poverty Network (EAPN) state, the overall persistent high level of poverty in the EU suggest that poverty is primarily the consequence of the way society is organised and resources are allocated, whether these are financial or other resources such as access to housing, health and social services, education and other economic, social and cultural services (EAPN 2020). In this statement, the authors find support for their attempt to contribute to the theoretical and methodological basis for studying the problem of multidimensional poverty, measuring and analysing it within the resource approach (Tikhonova 2006), which is based on the following methodological path: resources available for the people and households can be transformed into capital

as a result of its activation and capitalisation that, in its turn, can give the person socially economic benefit, i.e., a resource becomes a capital. The application of the resource approach can be found in studies of different social sciences, sometimes revealing innovative resources or innovative forms of its activation and capitalization. One of the co-author of this article used the resource approach in her previous study, proving that economic determinants of the territory competitiveness and development sustainability is, firstly, resources availability at the territory, and, secondly, ability of the territorial agents to transform them into territory capital (Boronenko, Drezgic 2014). So, those resources which are available at the territory, but have not been transformed into territory capital, are not able to determine also competitiveness and development sustainability of this territory. V. Boronenko and S. Drezgic assume that weak development of social technologies for activation and capitalization of resources is the most important reason for hindering the competitiveness and development sustainability of Latvia's regions (Boronenko, Drezgic 2014).

In this study, the authors will try to apply a resource-based approach to measuring poverty of residents, rather than territory competitiveness and development sustainability, as it was in the above-mentioned study, using the empirical data collected by the authors in one of the peripheral regions of Latvia - Latgale.

The methodology of this study assumes the use of new concepts: "resource-poor" and "functional-poor", as well as "resource-functional poor". The first group, according to the logic of the resource-based approach, may include those people who have insufficient resources as such, whereas the second (most interesting for analysis) group includes people whose cause of poverty is not the lack of resources as such, but rather a low level of their capitalization. In turn, the third group of the poor - the "resource-functional poor" - may include those people whose lack of resources as such is accompanied by a low level of their capitalization. In theory, it is the latter type of the poor that is the most difficult target group of the social policy, most in need of support.

To measure the multidimensional poverty of residents of Latgale region of Latvia within the framework of the resource-based approach, the authors used the methodological approach to resource classification proposed by one of the authors of this article (Menshikov 2008, 2011; Meņšikovs 2009; Men'shikov, Vanags 2011), and developed a scale-questionnaire presented in Table 2.

Table 2. A scale-questionnaire for measuring poverty of the population, including questions: Which of the resources indicated in the table do you or your family possess?
Does the presence of a certain resource provide you with anything in particular?

Resources for measuring poverty	I or someone from my family possess it	It brings me monetary income and / or social position and / or moral satisfaction
Economic resources		
Immovable or movable property	1	2
Monetary savings	1	2
Income: private business, salary, dividends, rental income, social benefits, royalties, etc.	1	2
Cultural resources		
Wide knowledge	1	2
High level of intelligence	1	2
Foreign language skills	1	2
Human resources		
Higher education	1	2
Profession	1	2
High level of professionalism	1	2

Social resources		
Favourable family environment	1	2
Connections with influential people	1	2
A lot of friends	1	2
Administrative resources		
Leadership skills	1	2
Responsible position (for example, at an enterprise, in a state institution, etc.)	1	2
Work experience in the state institutions, local governments or in the management of private enterprises	1	2
Political resources		
Participation in the activities of public organisations (for example, a political party)	1	2
Latvian citizenship	1	2
Status of a deputy, a politician	1	2
Symbolic resources		
Good reputation at the place of work or in the educational institution	1	2
Ability to come up with new ideas and engage others	1	2
Popularity in your city (village, region, state)	1	2
Physical resources		
Good health	1	2
Ability to overcome stress and psychological problems	1	2
Beauty, attractive appearance	1	2
Geographical resources		
Good place of residence (well-kept town or village with good infrastructure - shops, transport, sports and entertainment facilities, school, etc.)	1	2
Good demographic situation in the place of residence (many married couples, many children and newborns, etc.)	1	2
Wide access to information in the place of residence (Internet, newspapers and magazines, social events, etc.)	1	2

Source: compiled by the authors from the data of Menshikov 2008, 2011; Meņšikovs 2009; Men'shikov, Vanags 2011.

Based on the logic of multidimensionality and multi-criteria used by all approaches and tools for measuring poverty analysed in the previous part of the article, the authors have developed the following criteria for assigning respondents to one or another group of the poor (see Table 3).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

**Table 3.** Empirical interpretation of the "resource-poor" and "functional-poor"
as well as the "resource-functional poor"

Criteria	"Resource-poor"	"Functional-poor"	"Resource-functional poor"
Availability of resources	Respondents who (themselves or their families) possess <17 out of 27, i.e. <60%, resources	Respondents who (themselves or their families) possess> 17 out of 27, i.e. > 60%, resources	Respondents who (themselves or their families) possess <17 out of 27, i.e. <60%, resources
Level of resource capitalization	Respondents with> 60% of their available resources capitalized, i.e. bringing them monetary income and / or social position and / or moral satisfaction	Respondents with <60% of their available resources capitalized, i.e. bringing them monetary income and / or social position and / or moral satisfaction	Respondents with <60% of their available resources capitalized, i.e. bringing them monetary income and / or social position and / or moral satisfaction

Source: compiled by the authors

Thus, according to the empirical interpretation proposed by the authors, the "resource-poor" are those people who have relatively few available resources (less than 60% from the list proposed in Table 2 - by analogy with the principle of relative poverty applied in AROPE (see Table 1)), but the level of their capitalization is relatively high, i.e. > 60% of the resources available to respondents or their families bring them monetary income and / or social position and / or moral satisfaction (see Table 3). In turn, the "functional-poor" are those who have less than <60% of their available resources capitalized, i.e. bringing them monetary income and / or social position and / or moral satisfaction, despite the fact that they have relatively many resources as such, i.e. > 60% of all available resources. One and the same person can be both the "resource" and the "functional" poor (i.e. it is an "overlapping" group of "resource-functional" poverty, similarly to the criteria of the AROPE index), and also belong only to the "resource-poor", if one has relatively few resources as such at their relatively high capitalization, or to the "functional-poor", if the resources available to a person are poorly capitalized (see Table 3). In the result of the empirical analysis the authors will obtain three target groups of the poor: "resource-poor", "functional-poor" and "resource-functional poor," whose poverty has different causes and different essence.

4. Research results and discussion

The basis for the empirical analysis was the data of a representative sociological survey of the population of Latgale region of Latvia, which for many years has had the lowest socio-economic development indicators in Latvia. The survey was conducted in 2017. 798 adult residents of Latgale region were interviewed, the level of education of the respondents and their nationality, as well as the type of settlement (urban or rural) were considered.

The empirical analysis of the data showed that according to the method of poverty measurement proposed by the authors, 560 out of 798 respondents or 70.2% of the adult population of the region can be classified as poor in Latgale region. The distribution of the poor by groups is shown in Figure 5.
Figure 5. Share of the "resource-poor", "functional-poor" and "resource-functional poor" in the total structure of the poor, n = 560 people (100%), Latgale region of Latvia, 2017

Source: compiled by the authors according to the questionnaire results

As the data presented in Figure 5 show, the main share (74.2%) of the poor population of Latgale region is comprised of the "resource-poor" who have at their disposal less than 60% of the resources presented for the empirical analysis. In turn, the group of the "functional-poor" constitutes a very insignificant part of the respondents acknowledged to be poor - only 5.4%. At the same time, every fifth (20.4%) resident of Latgale region, acknowledged to be poor, suffers from a double burden of poverty - resource (lack of resources) and functional (insufficient capitalization of scarce resources). Interestingly, approximately the same share of EU residents falls into the intersection of any two sub-indicators of the three-dimensional AROPE index (see Figure 3).

Using the correlation analysis, the authors studied the relationship between the amount of resources and the level of their capitalization. The correlation between these two indicators across the entire sampling of respondents turned out to be weak (r = +0.201), though statistically significant (p = 0.000, correlation is significant at the 0.01 level (2-tailed)): the more resources a person has, the higher the specific weight of their capitalization is, and vice versa. This, according to the authors, proves the real existence of the resource convertibility process discovered by P. Burd'e (Burd'e 2001), which was studied earlier on the example of Latvia by one of the co-authors of this article (Menshikov 2008, 2011; Meņšikovs 2009; Меньшиков, Ванагс 2011). Noteworthy results are achieved by a more detailed analysis of the correlative relationship between the amount of resources and the level of their capitalization - by groups of respondents, divided according to the availability of a certain amount of resources: up to 30% of all resources presented for the analysis ("the poorest"), from 30 to 60% of resources ("not the poorest"), more than 60% of the resources ("non-poor") (see Table 4).

Table 4. Correlation between the amount of resources and the level of their capitalization by groups of respondents with different amounts of resources, Pearson's correlation coefficient, n = 798 people, Latgale region of Latvia, 2017

Group of respondents	Correlation between the amount of resources and the level of their capitalization, Pearson's correlation coefficient	The statistical significance of the correlative relationship, p-value
The "poorest" in terms of resources (less than 30% of resources), n = 181 people	+0.060	0.422, the correlation is not statistically significant
"Not the poorest" in terms of resources (from 30 to 60% of resources), n = 349 people	+0.106	0.048, the correlation is significant at the 0.05 level (2-tailed)
"Non-poor" in terms of resources (more than 60% of resources), n = 268 people	+0.079	0.199, the correlation is not statistically significant

Source: compiled by the author according to the questionnaire results

As the results of a more detailed correlation analysis, presented in Table 4 show, a direct positive correlation between the amount of resources and the level of their capitalization is statistically significant only in the group of the so-called "not the poorest", i.e. in the group of those "resource-poor" who possess from 30 to 60% of all resources taken for the analysis, i.e. it is this group where the level of capitalization of resources is most correlated to their quantity: the more resources, the more successfully they are capitalized. In turn, both in the group of "the poorest" and the "non-poor", the amount of resources and the level of their capitalization are not correlated (see Table 4), i.e. it is "the poorest" and "non-poor" who are least able to extract monetary income and / or social position and / or moral satisfaction from their resources, i.e. capitalize them.

5. Conclusions

Having analysed the existing approaches to measuring multidimensional poverty and their results, the authors came to the conclusion that at present, the indicators of economic poverty and inequality, calculated by the Gini index, a poverty line of 1.9 USD per day, the division into poverty and extreme poverty are no longer sufficient. The empirical studies show that a decent standard of living implies that a person has access to quality education, healthcare and basic needs. By focusing on these dimensions of poverty, governments can tackle the root cause of poverty, rather than its consequences. In turn, the use of a multi-criteria index, for example, AROPE, helps to understand the component structure of poverty of vulnerable groups, which stimulates the targeting of social policy.

The analysis of the results of measuring multidimensional poverty has shown that the incidence of poverty in the EU is quite high - virtually every twentieth EU resident is poor according to this method. The level of multidimensional poverty varies greatly across the EU, largely due to differences in the socio-economic development of countries.

The authors of this article propose to measure multidimensional poverty based on the resource-based approach, identifying three typological groups of the poor: "resource-poor", "functional-poor" and "resource-functional poor". The results of the empirical analysis on the example of Latgale region of Latvia showed that the "resource-poor" make up 74.2% of the total poor population of the region, and the "functional-poor" - 5.4%. Every fifth

(20.4%) resident of Latgale region, acknowledged to be poor, suffers from a double burden of poverty - resource and functional one.

The authors believe that resource poverty, functional poverty and resource-functional poverty represent different target areas for social policy, since they require conceptually different approaches and solutions. For example, for a group of the "resource-functional poor" it is necessary not only (if in general) to obtain resources as such, but to teach people the skills and social technologies of capitalizing their resources. Whereas the group of the "functional-poor", due to the availability of sufficient resources, generally falls out of sight of traditional social policy and, according to the authors, is a latent form of poverty, which, if left without attention and support, eventually turns into "resource poverty" most often addressed by the state social support system.

_____

AN OVERVIEW OF GREEN HRM PRACTICES AMONG SMEs IN SAUDI ARABIA[*]

Shaha Faisal [1], Mohammad Naushad [2]

[1,2] *College of Business Administration, Prince Sattam Bin Abdulaziz University, Al Kharj, Saudi Arabia*

Emails: [1]msfaisalq@gmail.com; [2] meetnaushad@gmail.com

Abstract. Green Human Resource Management (GHRM) has emerged as the driving force for businesses in the 21st century, as it is practiced by many progressive organizations globally. GHRM is considered as a source that is capable of gaining sustainable competitive advantage. For SMEs, it will not only provide impetus to growth but also a path towards sustainability. The current study intends to identify the most relevant aspects of GHRM, considered important by SMEs. Moreover, the study also intends to examine what should be the focal area among SMEs from the perspective of GHRM. The study is significant due to the fact that most SMEs lacks formal and full-fledged HRM department/activities due to financial and size constraints. The current study is grounded on the methodology of a multi-criteria decision-making approach, as without a scientific background and analogy, a sound decision making is not feasible. The current study utilises the Analytical Hierarchy Process (AHP), a multi-criteria decision making tool to support the objectives of the study. The data for the study was collected from the human resource managers/owners of facility management companies, based in Riyadh region of Saudi Arabia. Based on the results derived from analysis, the study establish the analogy that facility management SMEs in Saudi Arabia are least concerned about the "Green HR Acquisition" but moderately concerned about "Green HR orientation, Training and development", and are highly concerned about "Retaining highly competent employees in green HR practices". The implication of the study will be useful for mangers/owner of SMEs, and academicians.

Keywords: Environmental management; sustainability; Environment; SMEs; Green Human Resource Management (GHRM)

---

1. Introduction

Rapid growth after the industrial revolution has caused various environmental problems like climate change, resources depletion, decrease of biodiversity and other challenges to worldwide ecosystem integrity (Sulphey & Safeer, 2017). Destruction of natural resources, resulting from mass production also posed immense challenge to mankind (Opatha & Arulrajah, 2014; Chehabeddine, & Tvaronavičienė, 2020). This imposes a responsibility on global organizations to pursue environment friendly strategies to protect natural environment and follow sustainable business practices to avoid further damage to nature. Similarly, employees and other stake-holders also expect environmentally responsible behavior from corporations (Boiral et al., 2015; Rajnoha et al., 2019; Borimdesouza et al., 2019). It is now being widely recognized and emphasized that for sustainable competitive advantage, environmental management must be included as an integral part of management strategies (Brío et al., 2007). According to Haddock-Millar, et al. (2016) sustainable development of any organization depends on how well environmental functions are aligned with the organizational performance.

Organizational performance along with other factors depends upon the effective and efficient utilization of resources. Human resources, which form the human capital for companies are considered as the source of competitive advantage. An organization could inculcate the environmental aspects in the form of green policies that lays the foundation of organization cultural change process (Arulrajah et al., 2015). The human resources department need to motivate employees in the adaptation of organizational green initiatives (Priya et al., 2014). Emphasis to the green initiatives and value to environmental protection practices forms the concept of Green Human Resource Management (GHRM). GHRM contributes towards the successful strategic implications of environment management practices (Renwick, et al. 2013). Competent human capital along with shared perception of sustainability help in the strategic positioning of the organization (Jabbour et al., 2010, Yong & Yusliza, 2016).

Researchers across the Globe have studied GHRM practices in distinctive contexts and cultures. For example, Jabbour et al. (2010) conducted research on Branzilian manufacturing industries. Longoni et al., (2016) examined influence of GHRM of financial performance of organization in their study of various supply chain managers across different industries in Italy. Gholami et al (2016) et al., studied the impact of GHRM on sustainability of sports center in Malaysia. Masri and Jaaron (2017) tested impact of GHRM practices on environmental performance of Palestinian Manufacturing organizations. Mishra (2017) studied the status of GHRM in Indian manufacturing sector. Gupta (2018) analyzed the performance of different manufacturing organization in Indian context. Chaudhary (2019) studied the GHRM practices implication in Indian automobile Industry. Islam et al., (2019) examined the challenges of GHRM implication in ready-made garments factories in Bangladesh. Raut et al., (2020) identified most significant indicator of GHRM in their study of automotive service sector in India. Yong et al., (2019) conducted review of GHRM research from the period of 2007 to 2019, they also not found any GHRM research conducted in SMEs context globally.

It is highly evident that GHRM has been explored and tested upon by researchers across the globe, industry, contexts and cultures. It is practiced by many corporates in Arab world, Middle East and North Africa (MENA) region. However, Small and Medium Enterprises (SMEs) still remains indifferent by GHRM practices. The current study explores the GHRM practices among SMEs in Saudi Arabia. With the focus group and interview data from SME's owners and managers this study has also priorities the GHRM practices among SMEs.

2. Theoretical background

Gaining and maintaining the sustainable competitive advantage by adhering to the environmental norms has been a major concern for organizations in the current arena (Paille et al., 2014). The term GHRM involves different HRM policies and practices in that manner it can be aligned with environment and sustainability (Renwick et al., 2008, 2013; Mishra 2017; Longoni et al., 2016; Haddock-Millar et al., 2016; Nejati et al., 2017; Pham et al., 2019). According to Jackson et al, (2011) GHRM uses the HRM practices in a way that environmental management development among organization could be achieved in best possible manner. The primary motive of GHRM is to develop employee skills, knowledge and change the behavior to accomplish organizational sustainable goals (Renwick, et al. 2013). GHRM is considered as the culmination of green environmental practices to the basic functional structure of HRM (Arulrajah et al., 2015). The basic HRM functions usually resolves around three major activities namely, human resources' acquisitions, human resources development and retaining the competent employees (Opatha, 2013). Organizations create their human capital by effectively executing these basic functions. Human capital has always been a great source of competitive advantage. With a blend of green organizational practices, the GHRM has emerged as the means to achieve sustainability (Yong et al, 2020). There are various studies available in literature which elaborate these features in details. Table 1 indicates the different dimensions of GHRM which have been used by different authors in their studies.

Table 1. Dimensions of GHRM available in Literature

S.N.	Variables / Factors	Author
1.	Green Human Resource Planning (GHRP)	Liu and Xie (2013), Arulrajah et al., (2015), Siyambalapitiya et al., (2018)
2.	Green Job design and Analysis	Jabbour et al., (2010), Jabbour (2011), Masri and Jaaron (2017), Shah (2019).
3. On the basis of existing literature, and for convenience & suitability to the nature of the present study, the dimensions have been reduced to basics GRHM criterion and model. The categorization utilized in the study is confined to three major functions/categories of GHRM namely "Green HR Acquisition", "Green HR orientation, training & development" and "Retaining highly competent employees in green HR practices". The subsequent paragraphs take an exploratory and critical overview of these dimensions.

2.1 Green HR Acquisition

Green Human Resource acquisition includes all activities related to green talent acquisition process. Top management should make effective strategic plan for talent management to improve the performance of organizations (Yusliza et al, 2019). The major activities available in literature which can be categorized under green HR acquisition includes, green human resource planning, green job analysis, green job description, green job specification, green recruitment and green selection.

2.1.1 Green Human Resource Planning (GHRP)
Human Resource Planning (HRP) is the process of deciding in advance number of personnel required to meet the future demand of company as per predetermined objectives of company (Aswathappa, 2008). HRP integrate with organizational planning to ensure the availability of right type of employee in the right numbers (Sayyadain, 2004) GHRP could be the first step towards the GHRM practices implementation. GHRP identifies the appropriate number and type of employees required as per stated green or environmental objectives of the company (Opatha, 2013; Jackson et al., 2011). To meet the corporate environmental management goals organization require special skills of employees for imminent job position. GHRP accomplishes this obligation in a planned manner (Arulrajah et al., 2015). To maintain the balance between supply and demand of employees this planning process should be flexible in accordance with future changing environmental orientations (Siyambalapitiya et al., 2018).

2.1.2 Green Job Analysis
Job analysis is the process which determines job duties, responsibilities and specifies characteristics of an individual for a particular organizational position (Dessler & Tan, 2006). Job analysis generates necessary details for writing Job description and Job specification (Shah, 2019). Green Job Analysis provides the environment related duties and task of a job position and also specifies the technical abilities of a person for performing environment related task. Therefore, it is essential for effective green recruitment that job description and job specification should cover environment related issues, expected roles, duties and other technical requirements appropriately (Renwick et. al, 2013; Shah, 2019).

2.1.3 Green Job description
A green Job description is a written statement about role, task and responsibilities of a green job what an employee is supposed to perform in implication of environmental management (Renwick, et al. 2008, 2013). As mentioned by Shah (2019), an organization has both environmental and societal responsibilities to protect environment that's why companies now a days includes at least one task related to environmental management in job descriptions. Therefore a green job description includes the environmental commitment of employees apart from routine duties. (Jabbour et al., 2010; Gupta, 2018).

2.1.4 Green Job specification
Job description provides details of the job while job specification highlights human traits and required experience to perform a job effectively. Green job specification is the process of mapping the required level of competencies and qualification to perform environment related jobs (Siyambalapitiya et al., 2018; Faisal & Sulphey, 2018). A

green job specification ensure that new employees will be according to the predetermined need of the job and will be fit in environmental strategies of the organization (Phillips, 2007; Stringer, 2009).

2.1.5 Green Recruitment
Green recruitment and selection is the most significant phase of implementing GHRM practices in organization. Many researchers (Renwick et al., 2013; Yusoff & Nejati, 2019; Islam et al, 2019; Saeed et al., 2019) hold the similar view on green recruitment. Arulrajah et al., (2015) argued that proactive companies about the environment develop their own system and policies as they require employees according to their planned framework. These types of companies, first focus on green recruitment, second develop their existing workforce by imparting training and awareness about the environment. For effective green recruitment the job description and job specification should focus on environmental aspects and company's green expectations from future employees (Wehrmeyer, 1996; Mandip, 2012; Renwick et al., 2013). Therefore, recruitment advertisements need to mention clearly the environmental related agenda of the organization (Crosbie & Knight, 1995; Wehrmeyer, 1996). By this way only potentially talented candidates will be attracted towards the organization and will apply for vacant positions (Greening and Turban, 2000). Showcasing organization's environmental accomplishment through own website, different web portals and other public facing channels leads to "employer branding". Furthermore, this amicable behavior with environment gives an edge to organization and fascinate environmental aware applicants (Phillips, 2007; Stringer, 2009; Jackson et al., 2011; Guerci et al., 2016).

2.1.6 Green Selection
In this phase, organization needs to distinguish the green awareness of the applicant and ensure whether the personality of the employees is well aligned with the organization environment related objectives (Tang et al, 2018; Saeed et al., 2019, Shah et al, 2019). According to Arulrajah et al., (2015) the environmental related selection criteria helps organization to select best environment friendly employees in order to meet organization' expectation as per predetermined job description. Therefore to hire most suitable employees the green selection criteria is based on the applicant knowledge, attitude about environment. Organizations need to examine applicant awareness and concern about environment during interview and evaluate them appropriately before the final selection (Crosbie and Knight, 1995; Wehrmeyer, 1996).

2.2. Green HR orientation, Training and development
A proper Orientation and training program amplify newly recruited employee towards organization and retain existing employees as well. Furthermore, it also helps in increasing employee productivity and establish long lasting relationship with organization. The Green HR orientation, Training and development program can be summarised into two elements namely "Green Induction" and "Training and development".

2.2.1 Green Induction
Wehrmeyer (1996) describe that green induction program aim to make new employees aware about the organizational environmental culture in a proper manner. This program can be of two types – first the general induction, and second job specific induction. In the first program employees are given basic knowledge about policies of the organization related to environment. Some organizations arrange job specific induction program for new employees which cover each aspect of a particular job (Arulrajah et al., 2015; Yusliza et al, 2019). Many researchers opined that induction program must ensure that employees are aware of their environmental responsibilities and become familiar with organizational policies, culture as well (Mandip, 2012; Renwick et al, 2013; Al-Romeedy, 2019).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

2.2.2 Green Training and development

Green training enhances skills, knowledge and develop sustainable behavior of employees by providing training about environment sustainability. (Zoogah, 2011; Gupta, 2018). According to North (1997) to change the attitude of the employees, organization should conduct seminar and environmental education workshops. Anthony (1993) states that environment related training needs analysis is the first step towards training the manpower. It ensures the required level of environmental knowledge needed by employees. After identification of training needs organization should design the training program for employees (Tang et al., 2017). According to Jabbour (2011) in order to attain environmental organizational objectives, green training is an effective system that provides more knowledge to employees about different aspects of environmental issues. It gives insight to them to deal with it properly. A green training program should not be for specific department, it should provide equal opportunity to develop skill, knowledge and awareness about environment to all categories of employees (Sammalisto and Brorson 2008). For the future needs of the organization, a well programmed job rotation needs to be implemented that can give more exposure to employees (Renwick et al., 2008).

2.3. Retaining highly competent employees in green HR practices

Human capital is the driving force of an organization, and competent employees play leading role in gaining the competitive advantage over others. Organization needs to take strategic initiatives in their GHRM practices to retain competent and talented workforce (Faisal et al., 2020). Therefore, organizations should provide suitable career development opportunities along with good work environment. By taking a cue from the existing literature, retainment of employees can be confined to three important pillars, namely "Green performance Management", "Green Reward system" and "Green employee relations."

2.3.1 Green performance Management

Green performance management system is key aspect of implementing the GHRM process (Gholami et al., 2016). An organization needs to judge separately the environment related performance of employees, and then the normal performance system to ensure the employees are on predetermined track. Companies usually prefer to have the environment performance standard, Environment Management Information Systems (EMIS) and environment audits to measure the environmental performance (Marcus and Fremeth, 2009; Renwick et al, 2013). According to Milliman and Clair (1996) EMIS should be integrated with the performance measurement system to evaluate the performance of employees rather than using it just as a reporting system. Saeed et al., (2019) discussed the usage of green performance indicator to specify the green criteria (environmental responsibilities, environmental incidents and communication of the green policies) in performance appraisal system.

2.3.2 Green Reward system

Green reward system is an integral part of GHRM system as it motivates employees who performed as per environment standards set by the organization (Jabbour et al., 2008; Ahmad 2015). Similarly, Organizational sustainability is highly dependent on the green reward system (Arulrajah et. al., 2015). This can be adopted in two forms, financial and non-financial. Some organization give financial rewards like monetary incentives, bonus and cash prizes for good environmental performance (Phillips, 2007; Jabbour et al., 2008; Tang et al., 2017). Crosbie and Knight (1995) mentioned that some companies review the salary of employees as a result of good environmental performance. On the other hand some companies give non-monetary rewards in form of awards, prizes, admiration and special recognition. Opatha (2013) mentioned that this type of extrinsic rewards also gives motivation to employees to perform better.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

2.3.3 Green employee Relation

Employee relation refers to cordial relationship between employer and employee. Hormonal employee relations lead to high moral of employees that also increase the productivity, employee participation and employee involvement (Ahmad, 2015, Siyambalapitiya et al., 2018). Arulrajah et al., (2015) suggested that for the maintenance of green industrial relations unionized workforce participation is crucial as they play centralized role in implementation of green initiatives of the organization. Some companies offer a range of benefits like joint consultation and gain sharing with trade union to accomplish environmental objectives. The company should encourage employees to be the part of environment sustainability and their eco-friendly suggestions should be welcomed (Casler et al., 2010). Green employee relations includes actively involving employees in green suggestion schemes, allow them to work with green idea, encourage them to participate in problem solving circle and increase their participation in other green matters. Supervisor also supports employees in environment sustainability related issues (Renwick et al., 2008, 2013).

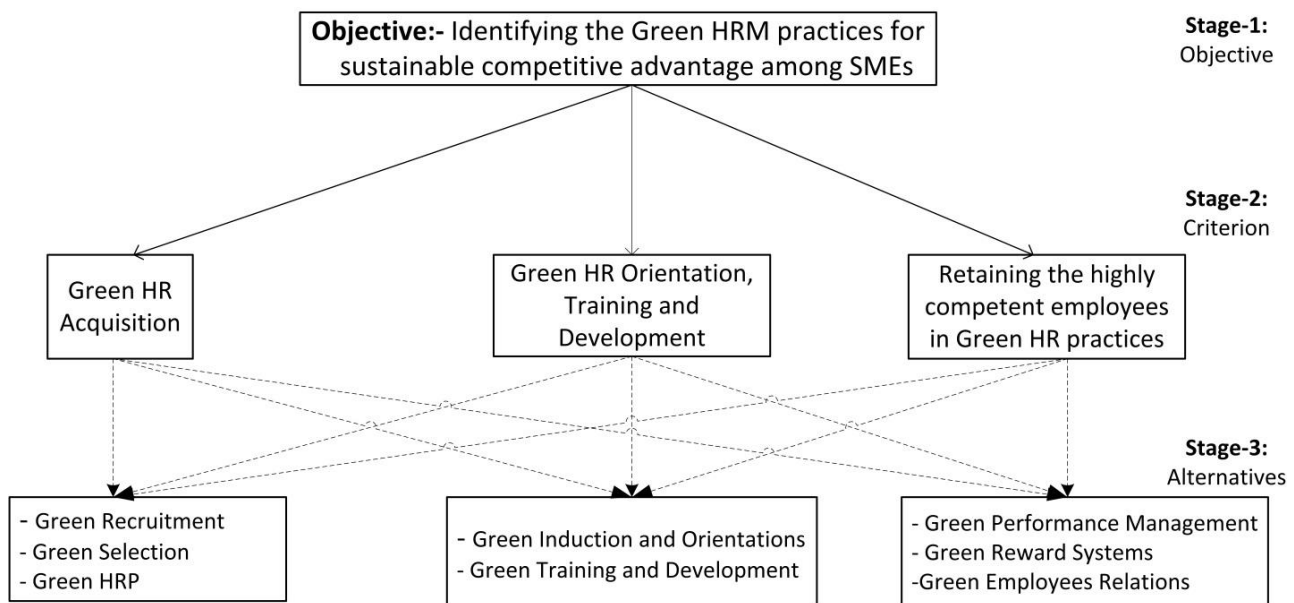
Thus, in the background of above discussion it could be easily understood that the green initiatives from HRM perspectives might not fetch equal weight from stakeholders, specifically the top management of corporations. Moreover, Small and Medium enterprises (SMEs) are highly susceptible to these practices due to their financial constraints. Overall, GHRM practices and systems are not practiced among SMEs. They tend to focus more on certain area rather considering the entire practices. Medium size companies might adopt the whole GHRM processes, while for small and micro enterprises, it is always difficult to look for entire system to be established. The current study is an endeavor to understand the highly expedient practices among SMEs and rank them in terms of their prioritization. Therefore, the model presented in figure 1 could be proposed for the current study to tackle the intended objectives of current study.


Figure 1. Theoretical Model for Green HRM practices among SMEs

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

From the figure 1 we can easily understood the theoretical framework of our study. Our aim is to identify the green HRM practices instrumental for sustainable competitive advantage. The objective can be further split into criterion for achieving the stated objectives. Each criterion has a series of distinct alternatives. Which form the stage three of our framework? The nature of the model aligns it into a hierarchy which can be understood by figure 1. Since, these criterion and alternatives are multiple, it create an ambiguous decision making scenario. Each criteria or alternative may not be equal in terms of importance to the objective. We need to shortlist the highly appropriate criteria and alternatives based upon their weighted score. A peer wise comparison is also needed to select the most appropriate criteria and alternative. The organic nature of current framework makes it highly appropriate for multi-criteria hierarchy analysis tool. We assume that Analytical Hierarchy Process (AHP) as the highly appropriate tool for problems with such nature.

3. Research objective and methodology

The nature of the problem discussed in the current study suggests that it emerged as a multi-criteria decision. The study intends to know the most relevant aspects of GHRM, being given high importance among SMEs. Moreover, it is intended to know what should be the focal area among SMEs for GHRM perspectives. It attracts the attention because most of SMEs lacks a formal and full-fledged HRM department/activity due to financial and size constraints. Therefore, the current study is grounded on the methodology of a multi-criteria decision-making approach. As without a scientific background and analogy a sound decision making is not feasible.

Therefore, a multi-criteria decision making tool must be considered for the given problem. Analytical Hierarchy process (AHP) is a multi-criterion decision making tool used in complex decision making problems, where criterion are many or ambiguous. AHP is a logical multi-criterion decision making technique based on human psychology and mathematics (Pourshahbi et al., 2018). Traditionally, AHP methodology is considered as a five step process (Naushad & Sulhpey, 2020). The first step of AHP is designed to set the goal. At second step the stated goal is decomposed in multiple criteria. In the next stage these criterion are again broken into multiple alternatives. In forth stage each criterion and alternatives are assigned weight based on their importance. The fifth stage of AHP methodology carried out the pairwise comparison with regard to criterion and alternatives. The final stage combined all judgments and come up with priority weights. The hierarchy thus developed for AHP studies could be seen in figure 1.

Usually, for AHP studies, data is collected either by structured interviews or focus groups with experts/practitioners in the same field. The data for the current study was collected from the HR practitioners in facility management SMEs in Riyadh region of Saudi Arabia. A structured questionnaire based on AHP scale was developed. Satty (1977), the premiere of AHP methodology seemed to develop a special nine point scale different from Likert scale. Before administering the AHP questionnaire, HR managers were oriented about green HRM practices and it's utilities. A focus group with HR managers was also conducted. Data thus collected was analysed by using Expert choice® software.

4. Results and Discussions

While, executing the AHP hierarchy (mentioned in figure 1) results were obtained in two forms of priority weights and pairwise comparison, i.e. (i) priority weights for criterion and (ii) priority weights to alternatives. Priority weights and pairwise comparison was made on a special AHP scale recommended by (Saaty, 2000), i.e. (from 1-9, where 9 is extremely important and 1 is equally important). Figure 2 specifies the importance of criterion selected based on their weighted score and pairwise comparison obtained after analysis. Results indicates that retaining the

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

competent employees in green HR practices had been the vastly important criterion for HR managers among SMEs. Moreover, Green orientation, training and development remains the second important thrust area for HR managers. While, green human resources acquisitions attracted the least importance from HR managers, retaining employees with value to the green HR practice attracted the highest weightage because of one obvious reason that organisations invest their good amount of resources on training and development and maintaining the good human relations. It is supported with the fact that among the facility management SMEs in KSA, "green human resource acquisition" attracted the least weightage. It could be arguably because that majority of workforce in KSA are expatriate workforce. Where employers are left with less choices because of availability and high acquisition cost. Therefore, they focus more on developing the existing/acquired workforce in green and environmentally sustainable practices. Which simply means that facility management SMEs are more interested in developing at their own "the sustainable green human capital". However, it has to be replaced with vice-versa strategy. SMEs are usually characterized with low financial resources. Thus, investing on training and development will add to their fixed costs. Therefore, SMEs in KSA must focus more on acquiring the workforce which are good in green HR practices instead of developing them at their own. They must acquire the employee which are already trained in Green HR practices.
Figure 2. Priority Weight for Criteria of Green HRM practices among SMEs

The results of relative weights for alternatives with respect to goal are presented in Figure 3. Green reward systems contributed highest to the goal with a priority weight of 58.30% (0.53). While, green job analysis contributes the lowest with a minimal weight of 0.20% (0.02) which is less than 1 percent (w<1). Green reward system gains the highest priority weight which indicates that SMEs in KSA generally and facility management companies specifically value the green initiatives and conduct of employees. This is in confirmation of the recommendations of studies like Jabbour et al., (2008); Opatha (2013); Tang et al., (2017) etc. It is supported by earlier studies too that rewarding the good conduct of employees not only motivate them to perform better but also helpful for organisational financial performance and human capital formation. A good amount of human capital ultimately results into a sustainable competitive advantage of organisations (Sulphey & Naushad, 2019; Naushad, 2019). If the top five green HRM practices are identified among the facility management SMEs, it could be summed up as (1) Green reward system with a priority weight of 58.30%, (2) Green performance management with a priority

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

weight of 15.90%, (3) Green Training and development (13.4%), (4) Green employee relations (4.4%) and (5) Green selection (3.5%).
Figure 3. Priority Weight for Alternatives of Green HRM practices among SMEs

The last step of AHP decision making process is to carry out a sensitivity analysis, where the input data are slightly modified in order to observe the impact on the results. If the ranking does not change, the results are said to be robust (Chen & Khan, 2013; Chang at el., 2007). The sensitivity analysis in Expert Choice varies with the weights of the criteria as input data. Sensitivity analysis is a fundamental process in the decision with AHP. Figure 4 (a) & (b) depicts the Performance Sensitivity Analysis (Preliminary).

In order to carry out the sensitivity analysis equal weights were assigned to three criteria selected for the study. Each criterion claimed approximately 33.33 per cent of weights. Figure 4 (a) & (b) presents the results of pre-sensitivity analysis, while figure 5 (a) and (b) provides the results of post sensitivity analysis. Figure 5 shows that changing the weights of criteria alters the priorities of alternatives. However, the top five alternatives were found to essentially remain same.
Figure 4(a). Performance Sensitivity Analysis (Preliminary)
Figure 4(b). Performance Sensitivity Analysis (Preliminary)

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810
Figure 5 (a). Dynamic Sensitivity Analysis (Preliminary)
Figure 5 (b). Dynamic Sensitivity Analysis (Preliminary)

This indicates that the results are directed at the same direction with a pattern. This shows that the alternatives that emerged from the analysis are robust enough to moderate changes in the criteria. Therefore, the priorities that emerged from the analyses could be sufficient and relied upon.

5. Conclusion

This study investigated the high priority factors of green HRM among facility management SMEs in KSA. Based on the results derived from AHP model, this analogy can be established that facility management SMEs in Saudi Arabia are least concerned about the "Green HR Acquisition" but moderately concerned about "Green HR orientation, Training and development", and are highly concerned about "Retaining highly competent employees in green HR practices".

Alternate adopted for the study witnessed the similar trend as "Green Reward system" attained the highest priority rate, followed by Performance Management. Both are considered elements of "Retaining highly competent employees in green HR practices". The results are in alignment of Gholami et al, (2016). This indicates that GHRM is in initial stage in SME sector. There is low recognition and acceptance of GHRP, Recruitment and selection, which are considered elements of "Green HR Acquisition" among SMEs. Most of the organizations are willing to adopt low cost initiatives of protecting environment. Masri and Jaaron (2017) found significant relations of green performance management and appraisal, green reward and compensation on environmental performance of Palestinian Manufacturing organizations. Similarly, Islam et al., (2019) revealed monetary incentives could be one of the effective solutions in implication of GHRM practices in the organizations. Similarly, Yu et al., (2020) suggested training (ability) and incentives (motivation) should be given focus in GHRM practices for better environmental collaboration. Current study also in line with this as it emphasized on "green reward" and also indictive towards importance of training in studied units.

The role of different GHRM Practices is widely acknowledged in the existing literature. Present study provides list of GHRM practices are highly effective and used by different SMEs in Kingdom of Saudi Arabia. Furthermore, present study clearly specifies the most important aspect of GHRM by comparing each practices using AHP tool. Therefore mangers can effectively plan and prioritize environmental related task. It is evident that organizations need to assess employees green behaviour and link it with pay and promotion (Hameed et al., 2020). The implications of the present study are in line with this, as it also suggested retention of effective green performance, and rewarding of the employees. The implication of the study is not only useful for mangers / owners of SMEs, but also for academicians working on GHRM especially for SMEs sector. A limitation of the study is that the results are based on only one sector, i.e. facility management SMEs in Saudi Arabia. This is considered to be a service sector organization. GHRM practices may vary between sectors, industries and national economies. Future research can be conducted on a bigger sample of SMEs by including manufacturing sector within and outside Saudi Arabia.

Abstract. Despite the variety of studies of modern innovative projects within the global pharmaceutical industry, the study of the management system for innovative projects in the pharmaceutical industry is relevant. The pharmaceutical business has a high social role in the country's economy, meeting the needs of the population in providing the necessary products. This is what determines the significant influence of the state on this sphere of economic activity, which is expressed in the mandatory fulfillment of a number of rigidly and clearly established requirements, due to which the observance of the rights of citizens in the possibility of obtaining high-quality pharmaceutical products will be ensured.The aim of the study is to consider the socio-economic characteristics of managing product innovations in pharmaceuticals (leading pharmaceutical markets) based on assessing the level of innovative activity of pharmaceutical companies, which addresses the problems of managing their role and importance in the healthcare system of Kazakhstan.

1. Introduction

A comparative analysis of the strategic goals of various economic systems allows us to talk about an objective increase in the role of innovative development in the general management system. Large-scale identification of new knowledge in various fields, as well as their combination, entails the emergence of new products and technologies. If an economic system of any scale and type of activity ceases to pay attention to innovation processes, then sooner or later this will lead, if not to the termination of its functioning as an economic system,

then to a decrease in the efficiency of activity. Innovation management is becoming a necessary element of economic development, since it allows us to differentiate in advance and identify the usefulness or hopelessness of an innovation, eliminate contradictions between innovations and existing old technologies, equipment, products, etc., as well as take into account the state policy in the field of innovation and scientific research.

The pharmaceutical market is an important sector of the economy of any country and is a criterion for its economic and social development, the level of well-being of the population. With the beginning of a large-scale diversification of the economy in Kazakhstan, industries that are fundamentally new for the country have appeared. The implementation of the state program for industrial and innovative development has borne fruit: machine building, petrochemistry, food production and a host of other new industries are developing in the country. One of the key, and without exaggeration, vital for every citizen of Kazakhstan, has become the pharmaceutical industry. The development of the pharmaceutical industry in Kazakhstan provides for a complex of organizational, economic, technological, managerial measures aimed at the design, construction and commissioning of pharmaceutical industries, the introduction of production technologies, research and development work for the development and development of the production of new competitive drugs , the creation of raw material bases in the regions from domestic medicinal plant materials, training of personnel for pharmaceutical production in accordance with GMP, which should ultimately contribute to an increase in the volume of domestically produced products, subject to state support for local pharmaceutical production, sustainable growth of the pharmaceutical market in recent years, and overall positive macroeconomic climate, Kazakhstan is becoming an attractive destination for pharmaceutical companies as a target market and region of the global center.

2. Research background

Most scientists who have studied the dynamics of the development of pharmaceuticals and the innovation processes characteristic of it indicated that in recent decades the industry has undergone continuous intensive changes both in business models and in production and research activities, while the cost of innovative medicines has risen. So, Rozhnova S.A., Tsypkina A.V. (2017) show the extremely important role of the stages of development of pharmaceutical products, which require detailed study, since they require more time and economic costs.We would also like to note that the strategic development of the pharmaceutical industry is subject to the influence of demographic trends: characteristic diseases corresponding to aging determine the focus of R&D and the directions of global investment activity in the industry. In this process, multinational corporations play a predominant role, locking in innovation processes and investing huge amounts of money in R&D.

In his scientific research, Scannell J. W. (2017) describes the profitability of drugs entering the market that are entirely dependent on their innovation and special status, supported by a patent mechanism. In the past two decades, the effective duration of the patent period has dropped significantly. This is due to the lengthening of the period of clinical trials and the timing of the review by regulators of the results of these trials in order to make a decision on the admission of innovative medicines to the market.

As a result, companies seek to recover costs in a shorter sales period and inflate the price of medicines. To this end, companies strive to release drugs at the same time with a high price and a potentially large sales market. That is, choose those therapeutic categories where, for example, the country's medical insurance system is ready to purchase a large number of expensive medicines (in accordance with the existing priorities in the country) (Philippidis, 2017).

Many scientists, including A. Bachman, J. Cantwell (2017), focused on the role of small companies in the innovative development of knowledge-intensive industries, including pharmaceuticals. As they pointed out, the development of information technologies leads to the convergence of technological competencies and knowledge among the largest high-tech companies - knowledge becomes more accessible for transfer, and globalization and internationalization of TNCs accelerate the exchange of knowledge between companies from different regions of the world and, more importantly, from different industries.

For example, if in the past industrial enterprises simply transferred knowledge about methods and processes from one production to another, then information technology has created an environment in which the interpenetration of various competencies takes place, which gives wider opportunities for innovative development. All this opens up prospects for a further global innovation leap, caused not so much by a specific technology (including technologies of widespread use), but by the emergence of a fundamentally new sectoral structure of the world economy. In such a situation, the sources (points of origin) of innovations and the mechanisms of interaction between them and established companies (in pharmaceuticals, mainly TNCs) change. In particular, many researchers highlight the growing role of pharmaceutical alliances and joint ventures, as well as independent researchers. That is, the innovation process ceases to be linear and goes beyond TNCs, opening up opportunities for small businesses and innovative start-ups.

According to the studies of Cantwell J. A., Bachmann A. (2017), an important role is also played by competition between developed and developing countries, as well as intra-industry competition between generic manufacturers and leading TNCs focusing on patented drugs.

Many scientists analyze the innovative indicators of the development of the world economy over the past ten years, which shows that in search of competitive advantages and effective technological solutions, the world's largest corporations have begun to increase investments in R&D (Ivanova, N., Mamadyarov, Z., 2019).

In their studies, Zervas G., Proserpio D., Byers J.W. (2017) highlight the development of the phenomenon of the shared economy (sharingeconomy), the intensification of the use of outsourcing, the changing role of small and medium-sized enterprises in a number of industrial and high-tech sectors of the economy, among which pharmaceuticals occupy an important place.

Most scientists, such as, for example, KoganL. (2017), who studied the dynamics of the development of pharmaceuticals and the innovation processes characteristic of it, indicated that in the past decade the industry has undergone continuous intensive changes both in business models and in production and research activities.Globalization played a key role in the intensive growth of the pharmaceutical industry, stimulated an increase in product sales and growth in the capitalization of leading TNCs. At the same time, globalization has led to increased competition in the pharmaceutical market, the emergence of a powerful generics market and the erosion of the share of leading TNCs in it. The largest pharmaceutical companies have already intensified their search for new opportunities for cooperation, have begun to develop new business models, trying to maintain their positions against the background of growing competition, and have tried to launch the process of transforming the industry from within, using the advanced capabilities of information technology (Schweitzer, S., Lu, Z., 2018).

The international activities of pharmaceutical TNCs are concluded in three main geographic regions of the planet: North America (up to 50% of the world market), Europe and Asia - primarily the USA, EU and Japan. China also plays a role - in addition to the potential of a huge domestic market, China is of key importance in supplying the world market with the primary substances necessary for the creation of drugs. It should be noted that for a long

time China remained relatively inaccessible to world TNCs, and only in recent years there have been tendencies for the activation of foreign TNCs in the Chinese market, strengthening of patent legislation and serious shifts in the mechanisms of pricing and R&D support (Hu, J., Mossialos, E., 2016).

Further development of the industry will depend on innovative success in pharmaceuticals and the reaction of leading TNCs to the ongoing changes (Kruger, H., 2018).Therefore, one of the main tasks of the state in the pharmaceutical industry is to achieve 50% of the domestic market supply with domestic pharmaceuticals.

Progress in the pharmaceutical industry does not stand still. The companies, together with scientific organizations, are actively working to find advanced approaches to pharmacotherapy. Pharmaceutical manufacturers spend about $ 150 billion annually on research and development. As a rule, out of thousands of compounds, only a small number of molecules receive approval for subsequent introduction into clinical practice. In general, in recent years, the largest number of new molecules at different stages of development or clinical trials fell on the segment of drugs for the treatment of cancer. The attention of pharmaceutical companies is also focused on such therapeutic areas as infectious diseases, neurology, hematology, endocrinology, allergy and immunology, cardiovascular and respiratory diseases, etc. (Bervelt, P., Dooren, V., 2019).

According to the forecast of IQVIA experts, by 2023 the global market for oncological drugs will grow to $ 140-150 billion, retaining its leading position among other therapeutic areas in terms of costs. Significant growth by 2023 should also be expected in the segment of drugs for the treatment of diabetes mellitus, the capacity of which will amount to 115-125 billion dollars. At the same time, the volume of the pharmaceutical market as a whole by 2023 will reach about 1.5 trillion dollars (IQWIA, 2019).

In her scientific research, Y. Prozherina (2019)analyzes the dynamics of the development of the global pharmaceutical market, which provides a forecast by 2023 with an emphasis on the growth of cancer drugs, which will grow to $ 140-150 billion, while maintaining a leading position among other therapeutic areas in terms of costs. Significant growth by 2023 should also be expected in the segment of drugs for the treatment of diabetes mellitus, the capacity of which will be 115-125 billion dollars. At the same time, the volume of the pharmaceutical market as a whole by 2023 will reach about 1.5 trillion dollars.

Analysis of the factors that determine the state and development of the global pharmaceutical industry, according to the research of T.A.Bizunok (2019), also indicates a high level of development of the pharmaceutical industry in economically developed countries, which is facilitated by the pharmaceutical transnational corporations created by them.

The growth of the global pharmaceutical industry is mainly due to the growth of the pharmaceutical markets of the BRICS countries, which include Brazil, Russia, India, China and South Africa (Kostin, K., Adams, R., Samli, C., 2015).

One of the key tasks facing the pharmaceutical industry of the BRICS countries today is to achieve a balance: on the one hand, it is required to provide citizens with vital, latest and most effective medicines, and on the other, to comply with the commercial interests of Big Pharma (Maksimtsev, I., Karlik, A., Yakovleva, E., 2016).

It should be noted that China stands out significantly against the background of other BRICS countries in terms of R&D expenditures. Moreover, at the beginning of the XXI century. countries started off with roughly the same indicators. However, it was China, developing its economy that stimulated the development of research and development and, in particular, the pharmaceutical sector (Plotnikov, V., Kuznetsova, V., 2018).

Currently, there is a need to solve a whole range of problems that impede the introduction of innovative drugs to the market, which requires an institutional approach, i.e. taking measures of a political, legal, social, organizational, scientific, technical and economic nature. In his research, A.A.Semin (2017) examines the institutional mechanisms for increasing the productivity of scientific research in the development of innovative medicines, consisting in improving institutions: public procurement, state registration of medicines, state support for small and medium-sized businesses, state scientific and technical policy, science and education, international relations.

Focusing on the Russian experience, C.Rudisill, S. Vandoros, J. Antoun (2014.) based on the current political and regulatory environment, it was proposed the possibility of switching to cost-based pricing, and in the short term - to introduce direct price negotiations and drug pricing in accordance with reference countries using the assessment of medical technologies.

The leading approach to the study of this issue, in accordance with the position of S.I.Ashmarina, A.V. Streltsov, A.M. Izmailov, E.M.Dorozhkin, M.Vochozka (2016) is an analytical approach that allows to determine the main directions of restoring the competitiveness of the pharmaceutical industry.

In the management of product innovations in the pharmaceutical industry, the marketing aspects of product innovations, pricing and stock options of the brand, as well as exclusivity options available through government regulators (Ding, Eliashberg, Stremersch, 2014).

Pharmaceutical policy in countries with a developing healthcare system has its own characteristics, which depend on the level of socio-economic status, as described in their research by W. Kaplan, N. Boskovic, D. Flanagan, S. Lalany, Ch. Ying Lin, Z. Ud Din Babar (2017.).

Thus, pharmaceutic are the most high technology industry in the world economy with research and development in the total sales of more than 14%, which in monetary terms in 2022 is expected to grow to $ 182 billion (Lin, Goncharov, Ivichev, 2016.).

3. Researchquestions

The dynamic development of the pharmaceutical market, the high organizational dynamics of its subjects and the increased competition impose new requirements on the organization of management of pharmaceutical enterprises. In these conditions, it is strategically important to determine the main directions for increasing competitiveness, based on the characteristics of a specific production of medicines, which is largely determined by the efficiency of organizing production processes, the use of limited resources, responsiveness to market conditions and flexibility in production management

For effective management of product innovations in the pharmaceutical industry, it is necessary to systematize the factors of innovative development of the industry, to identify problems in the market of innovative medicines, as well as opportunities for managing innovative activities of pharmaceutical enterprises. Therefore, in order to analyze the effectiveness of the management system for innovative projects in the pharmaceutical industry of the Republic of Kazakhstan, the author considered the main indicators of health care development and it's financing, which affect the further development of product innovations in the pharmaceutical industry. As a result, the dependence of the number of medical personnel in the pharmaceutical industry on the number of medical institutions and the amount of funding was revealed (Figure 1).

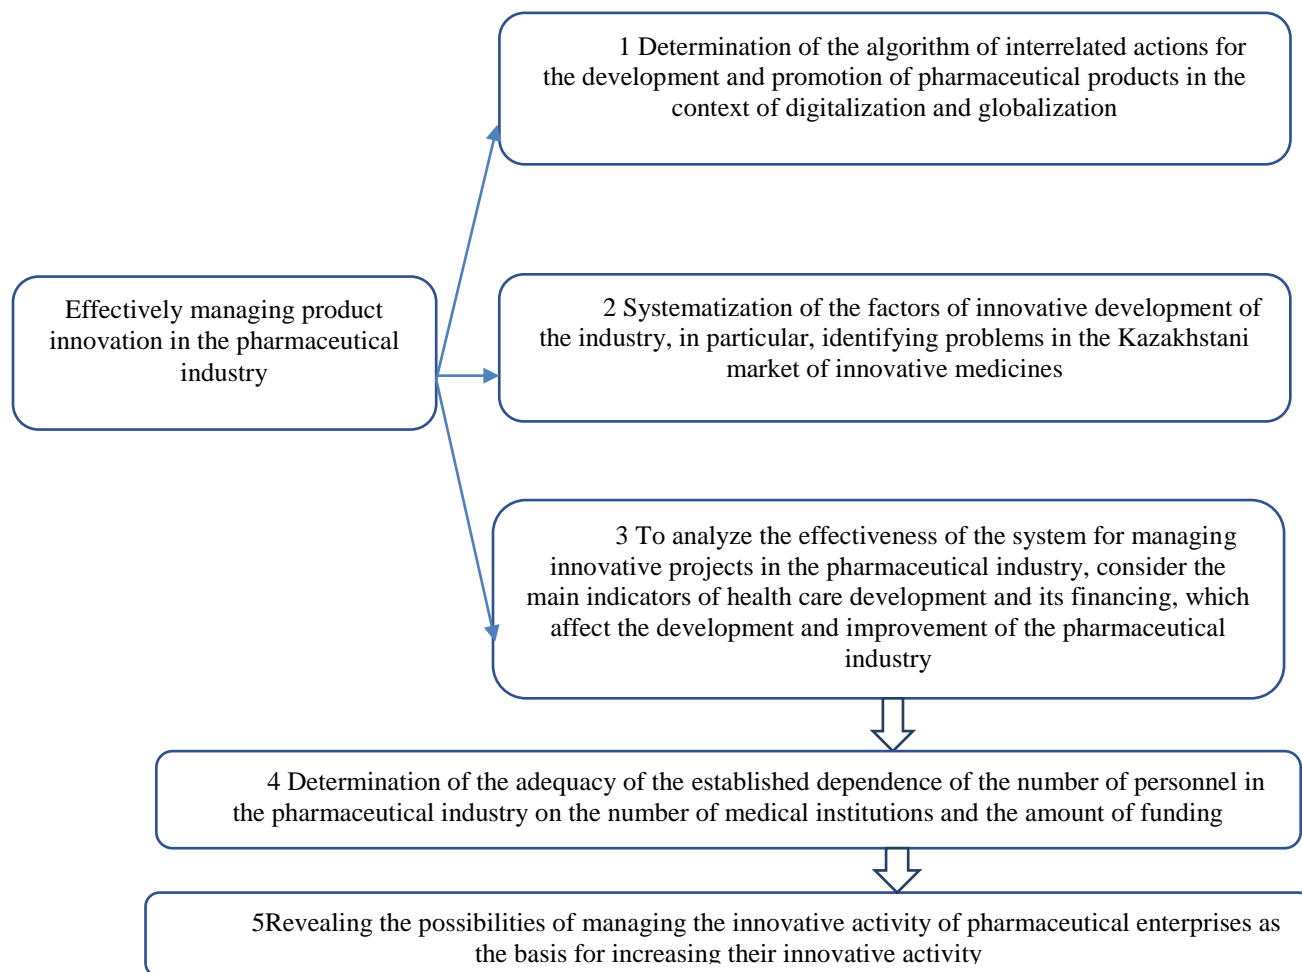
The pharmaceutical business has a high social role in the country's economy, meeting the needs of the population in providing the necessary products. This is what determines the significant influence of the state on this sphere of economic activity, which is expressed in the mandatory fulfillment of a number of rigidly and clearly established requirements, in particular, the effective management of product innovations in the pharmaceutical industry.


Figure 1. Research questions
Source: compiled by authors

Scientific novelty consists in a comprehensive study of innovative processes in the pharmaceutical industry, which will reveal the specifics and prospects for the development of the industry.

4. Methodologic approach and data analysis

The pharmaceutical industry is also one of the most socially significant segments of the economy. The results of the work of pharmaceutical companies have a significant impact on the health of the population and constitute an

important part of the healthcare systems of the countries of the world. The latest drugs, including vaccines, are critical to the stability of the global health system and are therefore strictly controlled by national regulators as well as international organizations such as the World Health Organization. All this determines the strategic nature of the industry both for the economic development of countries and their research potential. With all its scale and global character, the functioning of the pharmaceutical industry in each specific country depends both on the decisions and policies of local regulators and industry institutions, and on the level of participation of local companies in the global pharmaceutical market (Mamedyarov, Z., 2019).

In this regard, the decisive tasks of the state in the formation of the pharmaceutical market in Kazakhstan are:
- modernization of existing production facilities and construction of new pharmaceutical enterprises as part of the implementation of investment projects;
- implementation of international quality standards; i.e. Good Manufacturing Practice (GMP) at pharmaceutical industry enterprises;
- creation of conditions for import substitution of pharmaceutical and medical products based on modern technologies in accordance with international GMP standards;
- providing the industry with qualified personnel.

The development of the pharmaceutical industry in Kazakhstan provides for a complex of organizational, economic, technological, managerial measures aimed at the design, construction and commissioning of pharmaceutical industries, the introduction of production technologies, research and development work for the development and development of production of new competitive drugs, the creation of raw material bases in the regions from domestic medicinal plant materials, training of personnel for pharmaceutical production in accordance with GMP, which should ultimately contribute to an increase in the volume of domestically produced products.

Today, the domestic pharmaceutical industry is engaged in the research, development, mass production and distribution of medicines, medical products and medical equipment. At the moment, more than 200 pharmaceutical enterprises operate in the Kazakhstan market. 12 production sites of 8 domestic pharmaceutical companies received GMP (Good Manufacturing Practice) certificates (Table 1).

Table 1. InternationalGMPstandardsatdomesticpharmaceuticalcompaniesinKazakhstan

Source: compiled by authors according to Data of the Ministry of Health and Social Development of the Republic of Kazakhstan

It should be noted that most of them are enterprises with foreign participation. The presence of GMP certificates for certain industries should help to increase the output of manufactured products and contribute to a more free

promotion of domestic drugs to foreign markets. Of course, the state has a significant impact on the formation of the pharmaceutical market - this is:
- provision of a guaranteed volume of free medical care (guaranteed volume of medical care);
- support for domestic manufacturers within the framework of existing programs.
In fact, in order to develop the market, it was necessary to radically reform the entire system - production, import, registration and certification of medicines. Today, the country has streamlined activities for registration, certification, and quality control of medicines, medical devices and medical equipment, as well as their advertising. The National Medicines Information Center was created; state regulation of prices for medicines purchased from the budget was introduced. Also in Kazakhstan, a unified distribution system for medicines and medical products was created in the person of LLP SK-Pharmacia, which made it possible to ensure transparency of the public procurement of medicines market, bring it closer to the existing international standards of logistics, storage and distribution. All these measures brought their results.

In many respects, the current success of Kazakhstan producers is facilitated by the support they receive from the state, in particular, in public procurement (long-term contracts).

Within the framework of the State Program of Industrial and Innovative Development for 2015-2019, there are various tools to support business, including for pharmaceutical companies. Programs such as:
- "Business Roadmap 2020" (Official site of the Government of the RK, Business Roadmap 2020);
- "Exporter 2020" (Official site of the Government of the RK, Exporter 2020);
- "Employment 2020" (Official site of the Government of the RK, Employment program 2020);
- "Map of the industrialization of Kazakhstan for 2015-2019" (Official site of the Government of the RK, State program, 2015-2019);
- the program "Productivity 2020" and are aimed specifically at increasing the competitiveness of domestic enterprises by stimulating the production, export, personnel and technological potential of enterprises (Official site of the Government of the RK, Business Roadmap 2020).

And although, in general, according to the results of the first half of 2019, the volume of purchases of pharmaceutical products for guaranteed medical care in value and physical terms decreased, the share of Kazakhstani manufacturers increased - in physical terms from 59% in the first half of 2018 to 66.3% in the first half of 2019. year, in value terms - from 19% to 23.2%, respectively. But Kazakhstani producers are not only increasing their presence in the public procurement sector. They are systematically increasing sales in the retail segment, which is very important, since its volume is several times higher than the procurement segment for guaranteed volume of medical care, both in value and in kind. It is clear that they have to work in this segment without any support. on a par with other market participants, in a highly competitive environment for doctors' recognition and consumer preferences.As already noted, long-term contracts are a significant incentive for the construction of new or modernization of existing production sites in accordance with international GMP standards. After all, this is the main condition for their conclusion. So, since the beginning of the application of this support measure, 24 production sites have appeared in the republic, operating according to GMP rules.

The results for the first half of 2019 show that the Kazakh pharmaceutical market is going through difficult times. This is mainly due to the economic situation, the policy of the regulator aimed at rationalizing the costs of medicines purchased for the guaranteed volume of medical care. The high volatility of the national currency rate, the decrease in the purchasing power of the population and the related change in the structure of demand in favor of cheaper synonymous drugs make their contribution.

Only local producers are increasing their market share. Especially in the procurement segment for guaranteed volume of medical care. According to the Pharmacy Committee of the Ministry of Health of the Republic of Kazakhstan and LLP SK-Pharmacy, for 2019, the Single Distributor has already purchased 536 names of drugs and medical devices in the amount of 50.4 billion tenge for the provision of guaranteed medical care (Table 2).

Table 2. TOP-8 domestic manufacturers of medicines (A) and medical devices (B) in terms of the purchase amount for the guaranteed volume of medical care (tender, contract, agreement) for 2019

(in mln tenge)

Domestic manufacturers	medicines (A)		Domestic manufacturers	medicines (B)

Source: compiled by authors according to Data of the Ministry of Health and Social Development of the Republic of Kazakhstan

At the end of the first half of 2019, Kazakhstan took the first position in the ranking of producer countries in terms of market share. Only time will tell whether domestic producers will be able to retain their leading position in the future. But, certain prerequisites for this already exist.

Based on the available data on the sales volume of SANTO in the Kazakhstani pharmaceutical market, we will build a trend model with the help of which we will calculate the forecast value of the indicator under consideration for 2020.

Analytical methods for identifying trends in a time series are implemented within the framework of regression models, in which the variable acts as a dependent variable y_t, in our case, the sales volume, and in the role of the only explanatory variable time t.

The trend parameters are estimated using the least squares method, i.e. are selected in such a way that the graph of the function is located at a minimum distance from the points of the original data. According to OLS, when estimating model parameters, all observations are assigned equal weights, i.e. their information value is recognized as equal, and the development trend throughout the entire observation area is unchanged. Let's build a graph of the dynamics of sales for 2013-2018 (Figure 2).

Figure 2. Dynamics of sales volume, in million tenge
Source: compiled by authors

Graphical analysis indicates the closeness of the development of the considered indicator to the parabolic shape. Using the "Data Analysis" Excel setting, we will build a parabolic trend. The regression analysis protocol is shown in Figure 3.

CONCLUSION OF THE RESULTS

Regression statistics	
Multiple R	0,973240196
R-square	0,947196479
Normalized R-square	0,911994131
Standard error	1620,040941
Observations	6

Analysis of variance

Thus, the parabolic trend equation will take the form:

$$y_t = 14404,9 - 2394,275t + 719,125t^2.$$

To determine the predicted values of the sales volume, it is necessary to substitute the corresponding value of the time parameter into the resulting model ($t = 7$ и $t = 8$):

$$y_7 = 14404,9 - 2394,275 \cdot 7 + 719,125 \cdot 7^2 = 32882,1 \text{ mln.tenge;}$$

$$y_8 = 14404,9 - 2394,275 \cdot 8 + 719,125 \cdot 8^2 = 41274,7 \text{ mln.tenge.}$$

Thus, the forecasted values of the sales volume for 2019 amounted to 32882.1 million tenge, and in 2020, respectively, will amount to 41,274.7 million tenge.

According to the Pharmacy Committee of the Ministry of Health of the Republic of Kazakhstan and LLP SK-Pharmacy, in 2019, the range of domestic pharmaceutical products purchased under long-term contracts will increase to 493 drugs and medical devices (231 drugs, 262 medical supplies), and by 2021 it will be replenished another 112 drugs and 32 medical devices. At the same time, domestic companies demonstrated the highest sales growth rates, which significantly outstrip the growth of the pharmacy segment as a whole (Figure 4).
Figure 4. TOP-15 companies in the Kazakhstan market for 2019, (%)
Source: compiled by authors according to resource of www.pharm.reviews

In this regard, an increase in the purchase volume of the Single Distributor of domestic pharmaceutical products in monetary terms from 30 billion tenge to 73 billion tenge in 2024 is forecasted. This will help to increase the share in the budget segment, and if Kazakhstan pharmaceutical manufacturers continue to develop as actively in retail, they will have every chance to remain number 1 on the market.

Today, drug provision of the population is one of the most acute social problems in the system of state interests. It is no secret that at this stage, the country's drug supply is not effective enough and the costs are growing, a significant part of the population does not receive the necessary drugs.

Focusing on innovation, it is necessary to understand that innovation in the pharmaceutical sector is costly and unpredictable in terms of results, since it requires significant R&D expenditures in order to invent and test new drugs. Pharmaceutical companies can spend up to 10-15 years developing new drugs until they enter the market. During this time, companies incur significant costs with the high risks that new drugs may not pass clinical trials. Hence, the retail price for drugs that have successfully passed clinical trials and brought to the market is usually high, since the manufacturer must compensate for its costs. As a consequence, innovation in the pharmaceutical industry offers more patent protection than any other industry. Patent protection allows pharmaceutical companies to recover the substantial costs of inventing, testing new drugs, and obtaining regulatory approval for placing them on the market. However, determining the optimal balance between the level of innovation and the optimal timing and scope of intellectual property protection is an extremely difficult task, and each state solves this task in its own way.

By analyzing customer preferences and applying the latest technologies, it is possible to promote products in a more targeted manner, taking into account the characteristics of each target group, which increases the efficiency of promotion costs. For this you need to learn new tools and master them. In this regard, we propose a certain algorithm of interrelated actions for the development and promotion of pharmaceutical products in the context of digitalization and globalization (Figure 5).

Pharmaceutical companies need to use new channels of promotion, not limited to the activities of medical representatives, to introduce omnichannel models. This requires systematic targeted work, which includes the following components:
1) setting goals for the effectiveness of new product development;
2) creating partnerships with other companies, medical institutions, scientific institutions, as well as regularly analyzing trends and best practices to obtain new ideas from external sources and develop new dosage forms (including through the acquisition of biotech startups);
3) development of new competencies in a number of areas:
- the use of digital technologies, for example, for working with large amounts of data and using artificial intelligence;
- portfolio management of innovative ideas;
- building partnerships, including searching for and buying promising startups or shares in them;
- development of export markets;
4) the use of new approaches to work with portfolios of innovations in the field of products, processes and business models, in particular, mastering the methods used in the field of venture capital;
5) improving the efficiency of the research and development process:
- using digital technologies, rapid prototyping based on the Agile model, involving a large number of participants in the process;

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

6) the development of the function of fast time-to-market for new products, including the use of RWE's practical evidence base and innovative pricing methods (risk sharing concept).

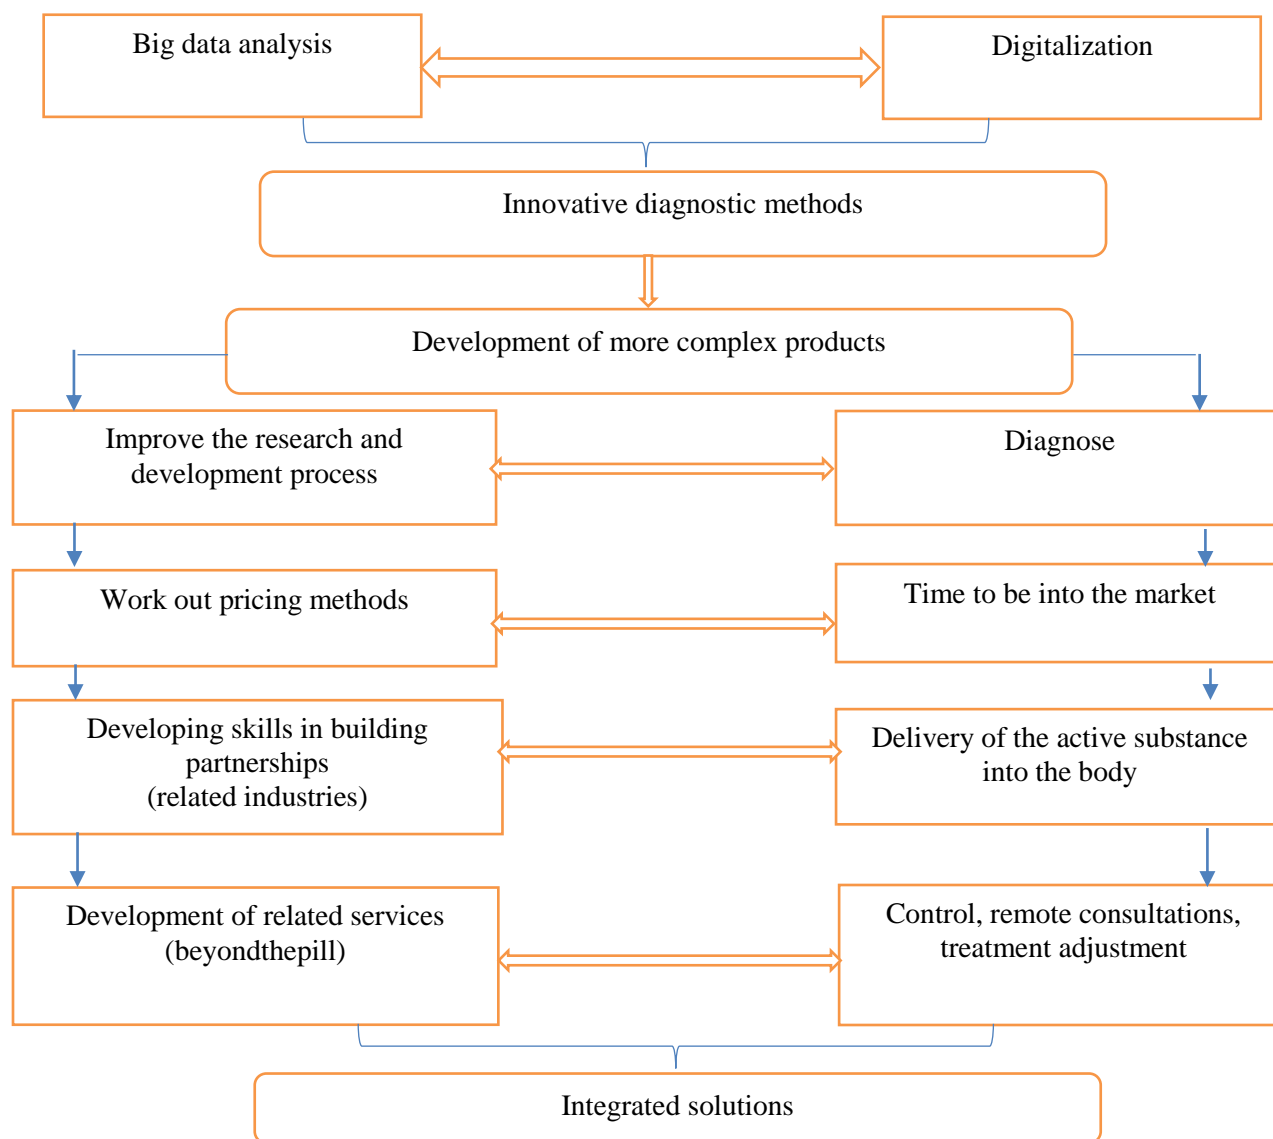

Figure 5. Algorithm of interrelated actions for the development and promotion of pharmaceutical products in the context of digitalization and globalization

The introduction of innovations is becoming one of the priority instruments for ensuring the growth of the state economy. Innovation is an effective tool in the competition, as it definitely leads to a company of welfare, to attract inevitable investments, as well as to the formation of new effective demand.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

In today's environment, only pharmaceutical companies that have sufficient sales volume, have an optimized structure for working with clients and possess the necessary new concepts for successful operation can be able to conduct a profitable business. In this regard, the role of the pharmaceutical industry in healthcare, in particular, for the Republic of Kazakhstan is obvious and huge.

The author uses a project approach to innovation and investment activity, which is based on the principle of cash flows, a feature of which is its predictive and long-term nature, where the analysis takes into account the time factor and the risk factor. At the same time, the effectiveness is determined on the basis of Methodological Recommendations for assessing the effectiveness of innovative projects and their selection for financing.

Therefore, to analyze the effectiveness of the management system for innovative projects in the pharmaceutical industry, we will consider the main indicators of health care development and its financing, which affect the development and improvement of the pharmaceutical industry (Table 3, 4).

Table 3. Key indicators of health care development in Kazakhstan

Indicators	2015	2016	2017	2018	2019	Growth in 2019 compared to 2015, in %
The number of doctors of all specialties in the pharmaceutical industry, in thousands of people	54,6	54,8	55,5	57,3	59,4	108,8
per 10 000 population	36,5	36,3	36,5	37,6	38,4	105,2
Number of nursing staff in the pharmaceutical industry, in thousands of people	115	117	119,6	125,2	130	113,0
per 10 000 population	76,9	77,6	78,6	81,8	84	109,2
Number of hospitals (using pharmaceutical products)	1029	1042	1063	1086	1055	102,5
Number of medical institutions	3463	3462	3434	3609	3896	112,5

5. Mathematical approach

Having considered the main indicators of health care development, as well as the amount of financing of health care in Kazakhstan for the period from 2015-2019, which were analyzed in Tables 3 and 4, their average values were identified and the forecast of expenditures for priority areas of the health care system is shown using regression analysis (Table 5).

For the analysis of costs, as a resultant attribute, such an indicator as the total expenditure of healthcare financing, which affects the further development of the pharmaceutical industry, was taken as a basis, and the factors affecting the resulting attribute:

x1 - inpatient care;
x2 - PHC;
x3 - construction and reconstruction of healthcare facilities;
x4 - medical education and science;
x5 - other expenses, including SES;
x6 - priority areas.

Table 5. Forecast of expenditures for priority areas of the health care system of the Republic of Kazakhstan

Indicator	Sign	Average value in 5 years	Calculation formula	Credibility	Forecast 2020	Forecast 2021
Total consumption	y	319,36	Y=76,1X+90,9	$R^2 = 0{,}98$	547,5	623,6
Inpatient assistance	x1	86,54	Y=9,29X1+58,6	$R^2 = 0{,}98$	114,3	123,6
PHC	x2	65,76	Y= 34,802exp(0,19 x^2)	$R^2 = 0{,}99$	108,43	131,04
Construction and reconstruction of healthcare facilities	x3	66,26	Y=16,81X3+15,8	$R^2 = 0{,}97$	116,6	133,47
Medical education and science	x4	10,3	Y=2,55X4+2,65	$R^2 = 0{,}99$	17,95	20,5
Other expenses	x5	15,88	Y=5,9X5-1,82	$R^2 = 0{,}97$	33,58	39,48
Priority directions	x6	74,62	Y=28,5X6-11,03	$R^2 = 0{,}97$	159,97	188,47

Source: compiled by authors according to Data of JSC Kazakhstan Industry Development Institute (KIDI)

Analyzing the data in Table 5, the following should be noted:
1) if the expenditure on inpatient care is increased by 1 unit, the total expenditure will increase by 0.29 units.
2) if the consumption for PHC is increased by 1 unit, the total consumption will increase exp (0.19) times.
3) if the expenditure on the construction and reconstruction of healthcare facilities is increased by 1 unit, the total expenditure will increase by 16.81 units.
4) if the expenditure on medical education and science is increased by 1 unit, the total expenditure will increase by 2.55 units.
5) if other expenses, including SES, are increased by 1 unit, the total consumption will increase by 5.9 units.
6) if the consumption for priority areas is increased by 1 unit, the total consumption will increase by 28.5 units.
Elasticity coefficient:

1) if the expenditure on inpatient care is increased by 1%, the total expenditure will increase on average by 0.93%.
2) if the expenditure on PHC is increased by 1%, the total expenditure will increase on average by 12.49%.
3) if the expenditure on the construction and reconstruction of healthcare facilities is increased by 1%, the total expenditure will increase on average by 0.99%.
4) if the expenditure on medical education and science is increased by 1%, the total expenditure will increase on average by 0.91%.
5) if other expenses, including SES, are increased by 1%., The total expense will increase on average by 1.02% units.
6) if the expenditure on priority areas is increased by 1%, the total expenditure will increase by 1.01% on average.
Thus, the total expenditure is more influenced by other expenditures, including SES (1.02%) and expenditures on priority areas (1.01%), to a lesser extent, expenditures on construction and reconstruction of healthcare facilities (0.99%) and the least influence have expenses for inpatient care (0.93%) and for medical education and science (0.91%).
on the number of honey. staff in the pharmaceutical industry is more influenced by the number of clinics than by funding.
Let us establish the dependence of the number of honey. personnel in the pharmaceutical industry from the number of medical institutions and the amount of financing of the guaranteed volume of medical care.
Let be:
y - number of medical personnel (doctors and paramedical personnel in the pharmaceutical industry) - thousand people;
x_1 - number of medical institutions - thousand units;
x_2 - volume of financing guaranteed by the guaranteed volume of medical care - billion tenge.
We will look for a two-factor regression equation in the following form:

$$y = a + b_1 x_1 + b_2 x_2, \qquad (1)$$

The system of normal equations for determining the coefficients of the regression equation is:

$$\begin{cases} na + b_1 \sum x_1 + b_2 \sum x_2 = \sum y \\ a \sum x_1 + b_1 \sum x_1^2 + b_2 \sum x_1 \cdot x_2 = \sum y \cdot x_1 \\ a \sum x_2 + b_1 \sum x_1 \cdot x_2 + b_2 \sum x_2^2 = \sum y \cdot x_2 \end{cases} \quad (2)$$

To determine the required values of the amounts, we will draw up a calculation Table 6.

Table 6. Estimated indicators

№	y	x_1	x_2	x_1^2	x_2^2	$y \cdot x_1$	$y \cdot x_2$	$x_1 \cdot x_2$
1	169,6	3,463	90,5	11,9924	8190,2500	587,3248	15348,8000	313,4015
2	171,8	3,462	118,5	11,9854	14042,2500	594,7716	20358,3000	410,2470
3	175,1	3,434	139,6	11,7924	19488,1600	601,2934	24443,9600	479,3864
4	182,5	3,609	195,1	13,0249	38064,0100	658,6425	35605,7500	704,1159
5	189,4	3,896	225,6	15,1788	50895,3600	737,9024	42728,6400	878,9376
Σ	888,4	17,864	769,3	63,9739	130680,0300	3179,9347	138485,4500	2786,0884

Source: compiled by authors

Thus, we obtain the following system of normal equations:

$$\begin{cases} 5a + 17{,}864b_1 + 769{,}3b_2 = 888{,}4 \\ 17{,}864a + 63{,}9739b_1 + 2786{,}0884b_2 = 3179{,}9347 \\ 769{,}3a + 2786{,}0884b_1 + 130680{,}03b_2 = 138485{,}45 \end{cases}$$

Let's solve the system of equations using Cramer's method:

$$\Delta = \begin{vmatrix} 5 & 17{,}864 & 769{,}3 \\ 17{,}864 & 63{,}9739 & 2786{,}0884 \\ 769{,}3 & 2786{,}0884 & 130680{,}03 \end{vmatrix} = 2153{,}8925,$$

$$\Delta_1 = \begin{vmatrix} 888{,}4 & 17{,}864 & 769{,}3 \\ 3179{,}9347 & 63{,}9739 & 2786{,}0884 \\ 138485{,}45 & 2786{,}0884 & 130680{,}03 \end{vmatrix} = 260798{,}801$$

$$\Delta_2 = \begin{vmatrix} 5 & 888{,}4 & 769{,}3 \\ 17{,}864 & 31799347 & 2786{,}0884 \\ 769{,}3 & 138485{,}45 & 130680{,}03 \end{vmatrix} = 23702{,}6084,$$

$$\Delta = \begin{vmatrix} 5 & 17{,}864 & 888{,}4 \\ 17{,}864 & 63{,}9739 & 3179{,}9347 \\ 769{,}3 & 2786{,}0884 & 138485{,}45 \end{vmatrix} = 241{,}9091.$$

So,

$$a = \frac{\Delta_1}{\Delta} = \frac{260798{,}801}{2153{,}8925} = 121{,}0826,$$

$$b_1 = \frac{\Delta_2}{\Delta} = \frac{23702{,}6084}{2153{,}8925} = 11{,}0045,$$

$$b_2 = \frac{\Delta_3}{\Delta} = \frac{241{,}9091}{2153{,}8925} = 0{,}1123.$$

We get the following two-factor regression equation:

$$y = 121{,}0826 + 11{,}0045\,x_1 + 0{,}1123\,x_2$$

To check the adequacy of the established dependence of the number of honey. personnel in the pharmaceutical industry on the number of medical institutions and the amount of funding, we use the correlation index. To calculate it, we will compose the following calculation Table 7.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Table 7. Estimated indicators

№	y	x_1	x_2	$\tilde{y}$	$(y - \tilde{y})^2$	$(y - \bar{y})^2$
1	169,6	3,463	90,5	169,3556	0,0597	65,2864
2	171,8	3,462	118,5	172,4893	0,4752	34,5744
3	175,1	3,434	139,6	174,5510	0,3014	6,6564
4	182,5	3,609	195,1	182,7101	0,0442	23,2324
5	189,4	3,896	225,6	189,2940	0,0112	137,3584
Σ	888,4	17,864	769,3		0,8917	267,1080

Source: compiled by authors

where $\bar{y} = \dfrac{\sum\limits_{i=1}^{n} y_i}{n} = \dfrac{888,4}{5} = 177,68$

The correlation index is equal to:

$$R = \sqrt{1 - \frac{\sum\limits_{i=1}^{n}(y - \tilde{y})^2}{\sum\limits_{i=1}^{n}(y - \bar{y})^2}} = \sqrt{1 - \frac{0,8917}{267,1080}} = 0,9983$$ indicates a very close relationship between the effective trait

and factor variables.

Let's analyze the resulting equation: an increase in the number of medical institutions by 1 unit leads to an increase in the number of honey. There are 11 personnel in the pharmaceutical industry, an increase in the volume of financing of the guaranteed volume of medical care by 1 billion tenge leads to an increase in the number of honey. personnel in the pharmaceutical industry 112 people.

Let's calculate the coefficients of elasticity:

$$Э_1 = b_1 \cdot \frac{\bar{x_1}}{\bar{y}} = 11,0045 \cdot \frac{3,5728}{177,68} = 0,2213$$, where $\bar{x_1} = \dfrac{\sum\limits_{i=1}^{n} x_{1i}}{n} = \dfrac{17,867}{5} = 3,5728$

- an increase in the number of medical institutions by 1% leads to an increase in the number of honey. personnel in the pharmaceutical industry by 0.22%;

$$Э_2 = b_2 \cdot \frac{\bar{x_2}}{\bar{y}} = 0,1123 \cdot \frac{153,86}{177,68} = 0,0973$$, where $\bar{x_2} = \dfrac{\sum\limits_{i=1}^{n} x_{2i}}{n} = \dfrac{769,3}{5} = 153,86$:

- an increase in funding by 1% leads to an increase in the number of honey. personnel in the pharmaceutical industry by 0.0973%.

Thus, the number of medical institutions has a greater influence on the number of medical personnel in the pharmaceutical industry than the amount of financing of the guaranteed volume of medical care. Comparing the two obtained regression equations, it can be noted that the volume of financing of guaranteed volume of medical care has a greater impact on the number of honey. personnel in the pharmaceutical industry than the total funding. Speaking about innovation in the pharmaceutical industry, we understand that we are talking, first of all, about modern biotechnologies used in medicine, where methods of influencing the pathological process at the level of molecules and genes are used. It has two main goals: analysis of the pathogenesis of a disease at the molecular

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

level and the production of drugs based on genetic modifications of microorganisms and body cells. Few biotech companies have managed to maintain their autonomy. Among them: Gilead, Amgen, Celgene (Table 8).

Table 8. Leaders among biotech companies that have retained independence

In general, everything has led to the fact that today the biotechnological sector has come under the control of the leaders of the global pharmaceutical market. This trend is quite logical and logical, since the number of new drugs that are produced by biotechnology is increasing every year. And, of course, large companies, instead of funding expensive in-house developments, buy out the rights to biologics from small businesses as soon as they show the first promising results in clinical trials. At the same time, a 50-80% markup on the current exchange quotation is already becoming a normal phenomenon. From the above facts, we can conclude that there is an intensive consolidation process in this area, and the number of main players is decreasing.

The biotechnology market in Kazakhstan is going through a real revolution, Kazakhstani pharmaceutical manufacturers offering modern high-quality drugs pose serious competition for the players of the international large pharma. In this situation, it is extremely important to create and strengthen in the minds of representatives of target audiences a strong and reliable image of Kazakhstan pharmaceutical manufacturer.

6. Conclusion

An analysis of the volume of financing in the health care system contributes to the modernization of public medical institutions, an improvement in the quality of medical services to the population, the successful implementation of large infrastructure projects, both in the health sector and in the further development of the pharmaceutical industry.

For effective management of product innovations in the pharmaceutical industry, it is necessary to systematize the factors of innovative development of the industry, to identify problems in the market of innovative medicines, as well as opportunities for managing innovative activities of pharmaceutical enterprises. Therefore, in order to analyze the effectiveness of the management system for innovative projects in the pharmaceutical industry of the Republic of Kazakhstan, authors considered the main indicators of health care development and its financing, which affect the further development of product innovations in the pharmaceutical industry. As a result, the dependence of the number of medical personnel in the pharmaceutical industry on the number of medical institutions and the amount of funding was revealed.

By analyzing customer preferences and applying the latest technologies, it is possible to promote products in a more targeted manner, taking into account the characteristics of each target group, which increases the efficiency of promotion costs. To do this, we need to learn new tools and master them. In this regard, authors had developed an algorithm for interrelated actions for the development and promotion of pharmaceutical products in the context of digitalization and globalization.

Thus, the growing volumes of pharmaceutical markets, high growth rates of drug prices, a shortage of certain types of drugs, the need for effective spending of budget funds and the social significance of drug markets make it necessary to conduct a thorough study and identify problems in the Kazakhstani market of innovative drugs and the reasons for their low effectiveness.

The introduction of innovations is becoming one of the priority instruments for ensuring the growth of the state economy. Innovation is an effective tool in the competition, as it definitely leads to a company of welfare, to attract inevitable investments, as well as to the formation of new effective demand.

Abstract. Starting with overview of existing approaches to meaning and use of the terms the paper focuses on analysis of two indicators vital in any economy – debt and investments. It discusses the differences of sovereign and country debts as well as internal and external debts. Public debt is important indicator for government performance evaluation but outcome and impact of total external debt should be on focus too for sustainable growth of any country. The article discusses the results of analysis conducted with regard to the gross public debt, gross external debt by sectors. Further analysis is focused on Foreign Direct Investment and External Debt stocks of the selected countries which are from developing and emerging economies. Empirical analysis of external debt and foreign direct investments of Kazakhstan is carried out as of the country which leads the list of Foreign Direct Investment related component of the external debt. We discuss the important factors to be further investigated with regard to debt management and investment policy of a country.

Keywords: external debt; foreign direct investment; investments; public debt; quasicorporations

1. Introduction

When used correctly, public debt improves the standard of living in a country. That's because it allows the government to build new roads and bridges, improve education and job training, and provide pensions. This spurs citizens to spend more now instead of saving for retirement. This spending by private citizens further boosts

economic growth. Whether a government spends on social security, health care, or others, it's pumping money into the economy. That boosts economic growth because businesses expand to meet the demand created by spending. That usually results in new jobs, which expected to have a multiplier effect in stimulating further demand and growth. As long as the sovereign debt remains within a reasonable level, creditors feel safe that this expanded growth means they will be repaid with interest.

Debt to GDP ratio is considered as an indication of how likely the country can pay off its debt. The ratio is usually related to public debt and public debt is one of sources to finance public expenditures. If the government has a shortage in public income to finance its activities experiencing a deficit of funds the solution may be a borrowing. But "public debt" may mean central government debt as well as debts of all branches of government. Moreover, depending on domestic legal jurisdiction, public debt may or may not include debts carrying a government guarantee. Analysis of any type of debt requires to make sure the definitions as they may be not the same and measured differently if called identically, for example, what is actually included in sovereign debt by the debt rating agency may not be the same as defined by the international institutions.

The ability to service a debt depends on the size of the debt, on the conditions of borrowing, the nature of the use of the loan, the prospects for the development of the borrower and the economic situation. Debt may be there in a result of investment decision, cash flow management problems and/or extraordinary events what may impact on a country's performance. Nations finance their debt through bonds or can also take on loans directly from banks, private businesses or individuals. Some also borrow from other countries. Depending on a borrower's residency the debt may be internal/domestic or external. Total gross external debt includes, as a rule, the external debts of all branches of government as well as private debt that is issued by domestic private entities under a foreign jurisdiction.

Investors drive up interest rates in return for greater risk of default. That makes the components of economic expansion, such as housing, business growth, and auto loans, more expensive. To avoid this burden, governments must be careful to find that effective "point" of public debt. It must be large enough to drive economic growth but small enough to keep interest rates low.Investment is referred to the purchase of capital goods being interchangeably called capital and meaning all manufactured aids used in producing consumer goods and services. The paper discusses the results of Gross External Debt Position analysis of 75 countries the data for which are available from "Quarterly External Debt Statistics SDDS". In addition to "External Debt-To-GDP" ranking the analysis reveals the debt position by sector – general government, central bank, deposit-taking corporations except the central bank, other sectors and Direct Investment Intercompany Lending.

Increase in government spending, which, through budget deficit, gets added to the debt contributes to a growing economy as well as foreign direct investments (FDI), which, in principle, should contribute to investment and growth in host countries.

2. Literature review

The national debt becomes a sovereign debt – debt instrument issued by a sovereign government, most sovereign debt takes the form of bonds: used interchangeably with the terms national debt, public debt – crisis when the country is unable to pay its bills. The first sign is when the country finds it can no longer get a low-interest rate from lenders. Banks worry that the country cannot afford to pay the bonds and fear a debt default they may require higher yields to offset their risk what, in its turn, may cause more costs what the country may face to

refinance its debt. The ability to pay off its debt by the nation is measured through commonly used Debt-To-GDP (Debt/GDP) ratio. The higher the ratio, the higher the risk of default what may worry investors.

Consequences of government deficits what leads, as a rule, to a borrowing and cumulatively, from year to year, becomes a "government" or "public" debt was discussed with the point of immediate consequence – paying more and more interest. Economists have traditionally argued that government borrowing, just like individual borrowing, may be justified relative to the purpose for which the money is used. By borrowing, the government places the burden of reduced consumption to future generations. Foreign indebtedness may increase, reducing future standards of living (Stiglitz, 2019; Zhao, Liu, Liu, Usman, Dutta, 2020; Mazzanti, Mazzarano, Pronti, Quatrosi, 2020).

The impact of Debt to the economy is one of matters what requires thorough analysis based on reliable data. The matter is on discussion of researchers during the last two to three decades. Debt discussion is necessarily conducted from the point of view of developed or developing countries dividing countries along economic prosperity (Bengoa, Sanchez-Robles, 2017). Debt is considered together with capital flow and impact of debt to economic growth may be assessed through its effect toinvestment, exchange rate, inflation, unemployment, etc. Some researches highlight the problems of mismanagement and relevant policieswhile others suggest that foreign direct investment is positively correlated with economic growth in the host countries (Ndubuisi, 2017). Another group of researches pointed out a critical level (or 'tipping point') when the debt may weaken GDP growth. Some studies found so-called 'tipping point', the level of Debt-To-GDP, 77% for any and 64% for developing countries, exceeding what may cost the country, 1.7 and 2 percent, respectively, in economic growth (Caner, Grennes, Koehler-Geib, 2018).

Countries of Eurozone follow the rule of critical level referring to the ratio of gross government debt to GDP not higher than 60% set by The Maastricht treaty in which "General government gross debt" is defined "as consolidated general government gross debt at nominal (face) value, outstanding at the end of the year in the following categories of government liabilities (as defined in ESA 2010): currency and deposits, debt securities and loans. The general government sector comprises the subsectors: central government, state government, local government and social security funds" (Official site of Eurostat, 2019).

The majority of EU countries satisfy The Maastricht criteria (Figure 1). Experiences of OECD countries for the period considered are worth to note: Luxemburg's public debt doubled in 2008 achieving 14,9% comparing to 7,7% in 2007, some countries – Latvia, Portugal, Slovenia, Slovak R., Spain and UK –suffered high level, 2 and more times higher than in 2007, public debts by 2014 and only few of them could manage to reduce the level. Interesting experience of two more countries – Ireland and Norway – may be learnt further: Ireland's public debt increased to 120% in 2013-2014 from 23,9% in 2007 and dropped to 76,9% in 2015 continuing to go down to date, Norway experienced decrease of public debt form 49% in 2007 to 27,4% by 2011 what kept further few years but significantly increased, more than 50%, during the last two years of the period considered.

The global composition of government bond stocks is particularly interesting where G-7 governments account for 75% of all government bonds outstanding with 55% accounted by two governments – US and Japan – while the other five 20%. As the researcher states, "Debt-to-GDP ratios continue to rise, because investors simply have nowhere else to go" and "only a handful of governments have the economic and institutional means of supplying bonds in the quantities needed to fulfil this safe haven function" (Lysandrou, 2017).

Public debts of Developing Economies and Emerging Market Economies are significantly low comparing to governments of developed countries with Singapore which is in the top of selected countries with increasing PublicDebt-To-GDP ratio in the period after 2015 reaching 112.9% in 2018.Ukraine has the highest ratio among the Emerging Market Economies countries from 2014 what may be explained by the political instability and relevant economic situation in the country. Significant increase of ratio in case of Azerbaijan and Kazakhstan is likely due to a fall in oil prices. Particularly, in Azerbaijan, the ratio achieved 48,4% being almost four times higher than in 2009 (12,4%).

Figure 2. Gross Public Debt, selected Developing Economies and Emerging Market Economies (% of GDP)
Source: compiled by authors according to data of IMF, Fiscal Monitor

Low level of public debt, comparing to OECD countries (Figure 2), characterizes the public finance situation in transition economies what may be explained by different factors from the significantly different starting point ("transition" from one system to another comparing to the countries which has a historically different economic and political situation) to the risks associated with a country's political regime.

Within the neoclassical economic paradigm, economic efficiency is the benchmark by which both market outcomes and government intervention are judged. Public borrowing within a democracy is a means by which state-based intermediation replaces market-based intermediation. This replacement might be universally beneficial or it might be beneficial to some but not to others, with the outcome depending on the institutional arrangements within which political and fiscal outcomes emerge (Jürgen, 2018).

Discussions on Debt consider the risk of triggering a crisis of confidence in the ability to repay debt, mainly focusing on "government debt". Public borrowing is significantly discussed in investigations with regard to impact of public expenditure on economic growth (Sasmal, 2018) and relationship between economic growth and other factors – investment, private and government consumption, trade openness – with a focus on sustainability of growth (Pegkas, 2018). A number of investigations attempt to assess a sustainability of the debt policy (Aviral, 2016) and a systematic long-term relationship between debt and structural primary balance (Beqiraj, 2018).

Both key words "growth" and "sustainability" of development is actively discussed in studies of the past years form several points of views, riskiness of high indebtedness with negative effect to fiscal policy and investors' perception, examination of the relationship between sovereign credit ratings and FDI inflows (Bayar, 2016), trying to understand the boundaries and effects of debt-based financing of public investments (Ari, 2018). Development of macroeconomic policies for achieveing future growth targets in long-term perspective and

relationship between growth and imbalances are considered with study of the fiscal policy issues (Akar, 2019), the effects the foreign exchange market and regulation of capital flows and "appropriate industrial policy" (Landesmann, 2018).

Some authors shed new light on the debt-growth relationship looking at the determinants of transfers and investmentin order to understand the effect of debt to an economy and suggest that there is a negative marginal relationship between debt and growth at intermediate levels of debt (Cordella, Antonio Ricci, Ruiz-Arranz, 2015). Nur Hayati Abd Rahman found that there is no mutual consensus on the relationship between public debt and economic growth referring to less studied effects of public debt on the economic growth in the upper-middle-income economies (Rahman, 2019).

The total country debt is the sum of public and private debts each of which, in its turn, is the sum of internal and external debts. Or relatively, the country's external debt may be both public and private, representing the capital flow from non-residents to public and private entities of the country.In accordance with the IMF glossary, "Gross external debt, at any given time, is the outstanding amount of those actual current, and not contingent, liabilities that require payment(s) of principal and/or interest by the debtor at some point(s) in the future and that are owed to nonresidents by residents of an economy" (Official site of IMF, 2019).

Developing countries usually seek foreign assistance such as aid, loan, investment, etc. In theory, international capital flow is expected to positively influence to the economy of recipient country which may directly or indirectly benefit through reducing cost of capital, technology transferring, promoting specialization, committing to better economic policies, etc (Bekaert, Campbell, Lundblad, 2017). But empirical research does not confirm straightforward benefits finding no or at best mixed effects reverting to the conclusion that it is not easy to find a strong and robust causal effect from financial globalization to economic growth, especially for developing countries. Some authors study the effect of legal system and institutional environment (Belgibayeva, Plekhanov, 2018). Lucio Sarno and Mark P. Taylor distinguishes four ways the broad categories of flows in the capital account: equity flows (EF), bond flows (BF), official flows (OF), commercial bank credit (BC), and foreign direct investment (FDI). They found "relatively low permanent components in EF, BF and OF, while commercial BC flows appear to contain quite large permanent components and FDI flows are almost entirely permanent" (Sarno, Taylor, 2016).

As per the glossary of IMF, Foreign Direct Investment (FDI) is defined as "the acquisition of at least ten percent of the ordinary shares or voting power in a public or private enterprise by nonresident investors. Direct investment involves a lasting interest in the management of an enterprise and includes reinvestment of profits". FDI appears to bring about a one-for-one increase in domestic investment. Highly efficient investment and a large growth response might be expected in countries with a relatively high physical and human capital stock, efficient financial markets and good legal institutions (Official site of UNCTAD, 2004). Changes in resource flows affected the share of public and publicly guaranteed debt what fell, while that of private debt increased as a consequence of financial and capital account liberalization and led to a shift from syndicated bank lending to foreign direct investment (FDI) as the major source of external financing for developing countries (Tanna, Li, De Vita, 2018). Despite the evidence presented in recent studies, other work indicates that developing countries should be cautious about taking too uncritical an attitude toward the benefits of FDI (Hausmann, Fernandez-Arias, 2017).

Hausmann and Fernández-Arias (2000) point to reasons why a high share of FDI in total capital inflows may be a sign of a host country's weakness rather than its strength. One striking feature of FDI flows is that their share in

total inflows is higher in riskier countries, with risk measured either by countries' credit ratings for sovereign (government) debt or by other indicators of country risk. There is also some evidence that its share is higher in countries where the quality of institutions is lower. One explanation is that FDI is more likely than other forms of capital flows to take place in countries with missing or inefficient markets. In such settings, foreign investors will prefer to operate directly instead of relying on local financial markets, suppliers, or legal arrangements (Official site of UNCTAD, 2009).

Less volatility of FDI comparing to other types investment flows were noted by several authors as well as the fact that FDI flows involve not only financial capital but technological, managerial and intellectual capital (Wie, 2016). The versatileimpact to and from FDI in a globalized world can be found in the works of the authorswho studied dynamics of gross capital flows across crisis types, correlation between net inflows and outflows of FDI, relationship between FDI and the home performance of firms (Prakash, 2001). The most recent studies assess the impact of FDI to the environment (Broner, Didier, Aitor Erce, Schmukler, 2016).

However, FDI may not necessarily benefit the host country: through FDI, foreign investors gain crucial inside information about the productivity of the firms under their control (Kim, Pertovsky-Nadeau, 2016). This gives them an informational advantage over "uninformed" domestic savers, whose buying of shares in domestic firms does not entail control. Taking advantage of this superior information, foreign direct investors will tend to retain high-productivity firms under their ownership and control and sell low-productivity firms to the uninformed savers. As with other adverse-selection problems of this kind, this process may lead to overinvestment by foreign direct investors. The recent work has also cast the evidence on the stability of FDI in a new light (Dirk, Procher, 2018). Though it is true that the machines are "bolted down" and, hence, difficult to move out of the host country on short notice, financial transactions can sometimes accomplish a reversal of FDI (Ah, Nguyen, 2019). For instance, the foreign subsidiary can borrow against its collateral domestically and then lend the money back to the parent company (Zhenghui, Zimei Huang, 2019). Likewise, because a significant portion of FDI is intercompany debt, the parent company can quickly recall it.Currency crisis, excessive leverage, weak institutional environment were mentioned by these researchers as reasons for caution (Demena, 2019).

Comparing the debt to GDP, as the GDP is an income for the period while the debt is the position at the specific date, is not sufficient to assess the financial position of any country while excess GDP debt is the indicator to be subject to further detailed analysis in order to understand the economic and financial situation of the country.

Evaluation of effects is usually carried out to understand the causes brought to the effects and identify the factors driving the effect. The result of evaluation can form a basis for changes in regulation and creating tools for government intervention what might cause effects in other areas of national economy. We looked at the issue from the point of short-run and long-term: do we mean one-year saying short-run or three years what is, for example, a "budget period" in Kazakhstan what the inputs and outputs form public expenditures are planned for. Then long-term definition depends on short-run period length, from one side, and the "long-term" plans and/or strategies for the next 5-10 years. Empirical study may be performed for the long period to assess the general effect of subjects under investigation and more accurate results may be achieved with detailed appropriately structured data.

Considering a number of classifications of the debt – "government debt", "public debt", "sovereign debt", "external debt" – we were interested in "external debt" meaning both public and private sectors borrowings where the lender is a non-resident. The external debt matter is one of frequently discussed questions in the countries with a rapid development what could cause an excessive debt burden from the point of a society.

The next point what we focused on is the nature of the item to be investigated in order to correctly determine the relationship in imbalance issues. The debt is the "balance sheet" item and, consequently, accounted in the country's accounts as liabilities. The debt may be either short-term or long-term. Other effects from the debt is expenses being an "income statement" item and in- or out-flows being a "cash-flow" or "capital-flow" item. If the majority of total debt is external, i.e. related to non-residents, it might become the country dependent on the economic and financial position of another country and/or countries.

FDI, by its definition, is another "balance sheet" item being accounted as an asset and depending on its size ("10%", "49%" or even "100%") and on scale of activity its effect might be very significant to the industry and/or even to the national economy. Effect from FDI to the economy is production of goods/services being a part of GDP. Foreign investors may finance the activity by means of investments into shares of the company or by the debt instrument where the borrower is FDI with any counterpart. If the counterpart is a non-resident it brings to "outflows" of cash and might have an effect to financial policy of the country. Discussions on FDI is more meaningful if to focus on "gross" and "net" (or, "inflows" and "outflows"). But the flows may be related to both FDI to the country and FDI from the country.

Our study is about the economy sectors' share in the external debt of a country with comparing the external debt with FDI flows empirically testing the FDI flows to the country and its relationship to the country's external debt.

3. Data and methodology

Preliminary analysis of "Data from database: Quarterly External Debt Statistics SDDS" of 74 countries as of the end "2018Q4" last updated 07/31/2019 (Table 1 - Gross External Debt Position by Sector (USD millions) reveals Luxemburg at the top of the list of ExternalDebt/GDP (%) list with the debt almost 60 times higher than its GDP (see Annex 1). West Bank and Gaza is in the bottom of the list with 9.7% ExternalDebt/GDP ratio.

Table 1. Gross External Debt Position by Sector

External Debt position	General Government	Central Bank (CB)	Deposit-Taking Corp., exc. CB	Other Sectors	DI: Intercom Lending	total
mln USD	17 535 699	4 421 087	25 176 987	23 416 413	12 006 267	82 556 453
% oftotalExternal Debt	21,2%	5,4%	30,5%	28,4%	14,5%	100,0%
min	0,2%	0,01%	0,04%	3,0%	1,6%	
max	77,0%	32,6%	66,7%	54,6%	63,6%	

Source: compiled by authors according to Eurostat

As given in the table 1 provide above, "Other Sectors" and "Deposit-taking corporations excluding Central Bank" accounts for about 60% of the total external debt. It should be noted that, "general Government is defined as "All government units and all nonmarket, nonprofit institutions that are controlled and mainly financed by government units comprising the central, state, and local governments; includes social security funds and does not include public corporations or quasicorporations. While the definition of "Other sectors" might be not straightforward, we believe that the external debt of "public corporations or quasicorporations" is accounted under this label. The debt related to FDI is accounted as a part of external debt and due to payment to non-residents.

Further analysis of details of each country's position demonstrates "the leaders" for each section. Ecuador's government sector is the main borrower of debt from non-residents with 77% of the country's total external debt. Slovak Republic's Central Bank leads the list of central banks who relies on the non-residents' funds. Deposit-taking corporations of Denmark is the most active sector in the country in attracting funds from abroad. Ireland's "Other sectors" owe to non-residents 54.6% of the country's total external debt. Finally, Kazakhstan's external debt is mostly – 63,6% of the country's total – related to FDI despite of significant difference between gross and net FDI inflows. The details of inflows for the period 2013-2019 is given in the Table 2 in accordance with the country's official statistics.

Table 2. Kazakhstan: Gross and net FDI inflows

mln USD	2013	2014	2015	2016	2017	2018	2019
Gross inflow of direct investment	24 098	23 809	15 368	21 367	20 960	24 276	24 114
Net inflow of direct investment	10 321	8 489	4 057	8 511	4 669	3 817	3 118
difference (Gross-Net), calculated	13 777	15 320	11 311	12 855	16 291	20 459	20 996

Source: compiled by authors

Comparative analysis of two indicators – External Debt stock and FDI stock – was conducted in order to understand their correlation and graphically presented below. Both indicators are given as per the World Bank data except to Azerbaijan and some Central Asian countries – Kyrgyz Republic, Tajikistan, Turkmenistan and Uzbekistan – external debt stock of which are referred to publicly available unofficial sourcesdue to lack of official disclosure.
Figure 3a. Developed economies: FDI and External Debt stocks of selected countries
Source: compiled by authors according to Eurostat

World FDI inflows tend to decrease from 2015 to date with a dominant position of developed economies in investments to other countries. In order to investigate a relationship between FDI flows and debt the gross

amounts would be relevant to use.Due to shortage of time series data on external debt position of developed countries further analysis was not carried out. In case of developed countries, FDI stock is not a major component of external debt.

As of the end of 2018, selected developing economies external debt position is insignificant being in total less than the UK external debt.In the meantime, comparison of two figures – 3a) for developed economies and 3b) for developing countries – reveals an obvious difference in relationship of the FDI and external debt stock. Unlike developed countries, developing countries are interested in attracting foreign investment. A certain relationship between the FDI and external debt stock of developing economies may be there due to attractiveness of these countries for investors who expect higher returns as a reward for higher risks.
Figure 3b. Developing economies: FDI inward and Gross External Debt stocks of selected countries
Source: compiled by authors according to Eurostat

Time series data on External debt limited to the available data from "External debt stocks (% of GNI), World Development Indicators, Last updated 01.07.2020" is given for comparison purposes assuming the insignificant differences between GDP and GNI of the countries under analysis. Few developing countries like Hong Kong, Korea Republic and Singapore were not analyzed as there is no relevant data. Graphical method of analysis is given in the Figure 4.

Figure 4. External debt stocks (% of GNI), years 2007-2018
Source: compiled by authors according to data of OECD

The figure approximately represents the trend for a given period and countries as the Gross National Income (GNI) of the countries is nearly of their GDP. According to data of the World Bank Group, Annex 1 – Gross External Debt Position by Sector, some countries – Luxembourg, Ireland, Malta – appear at the very top of the list as of the 2018 year end with the highest External Debt-to-GDP ratio.
Figure 5. Kazakhstan: External Debt structure by borrowers
Source: compiled by authors according to data of National Bank of the Republic of Kazakhstan https://nationalbank.kz/en

Debt means extra, interest, expenses, what could be compared to the return on investments if the debt is due to investment policy. The country's capacity to repay a debt may depend on a total – public and private – (external) debt burden. If the private external debt is significant and, consequently, the businesses profit goes down due to high interest expenses the government may decide on intervention. This fact is especially important in the countries like Kazakhstan where there are big government business enterprises. To the date the country's external debt to GDP is 93% about 1/3 of which is the external debt of, mainly, state-owned enterprises while more than 60% is "liabilities of local firms to foreign investors and related (foreign) parties", i.e. due to FDI as noted above.

According to Figure 5, graphical method of external debt analysis of the Republic of Kazakhstan demonstrates some risks mentioned above with regard to FDI being increased from 31,0% in 2007 to 62,1% in 2019 of the total external debt.

4. Empirical results

Referring to the fact of leadership of Kazakhstan in FDI sector the external debt and FDI stock regression analysis was the subject of the empirical study with 23 of observations considering the dependence of external debt growth on FDI.

Assuming that FDI flows influence growth of external debt, the dependence may be expressed as Y = a+bx, where External debt is denoted by 'y' and FDI inflows is by 'x'. The result of the study gives an overall impact of FDI and dependent on other factors influencing external debt.

As FDI net inflows is less relevant to Debt we decide to use FDI gross inflows. Indeed, the difference between gross and net FDI inflows is considerable (see Table 2 above) emphasizing the nature of the FDI flow rather than the FDI stock/asset.

We conducted some further investigation into the FDI details as the gross FDI comprises both equity and loan components. The matter is important for evaluation of the FDI effect to the GDP growth through the investments into main capital. Results of the investigation will be presented in coming papers after thorough analysis of appropriate data and relevant information.

5. Conclusion

External debt burden is subject to further analysis depending on the borrower and lender as well as maturity and other terms. For the thorough analysis of the external debt impact to economy the countries' data should be carefully selected with the clear borders of the public and private sectors as well as with the internal and external components of the debt.Then Debt as "flow of money" not in any way belonging to capital or any other contribution could be compared to "capital flow", i.e. investments for assessment of its impact to economy.

Foreign direct investment may contribute to growth if it is an economic investment. If the potential risks – reversal through financial transactions; adverse selection and fire sales; excessive leverage; loss of domestic competition – are managed well then "flow" is transformed into "asset", and the real contribution to economy of "asset" may be assessed depending on the investment return. The assessment may be carried out on the basis of investment by investment analysis considering both economic and social benefits.

Further research in this regard may concern the investments into main capital. An increasing debt may dampen growth over the long term as debt holders may demand larger interest payments as a compensation for an increasing risk that they won't be repaid. Therefore the issue of investment into main capital is vital in public spending as well as in foreign investor's activity. Economically beneficial investments made with care on social and environmental aspects of an activity may bring to sustainable growth thereby justifying the efforts of government and/or investors. Adding value to the business should be on focus in foreign investment analysis. Foreign investors who try to dispose of unprofitable portions of the business or use the company's collateral to get low-cost loans will not add economic value. Economic value added may be assessed by study of reinvestment policy, when earnings in host country work for expansion instead of lending the funds back to the parent company.

One of important matters for further investigation is well-defined border between private and quasi corporations what certainly affects the public debt position. The matter is whether the debt of quasicorporation should be treated as public. As the assets of corporations with a full or controlling ownership of government are public, the liabilities could be treated public as well.

Policy recommendations for developing countries should focus on improving the investment climate for all kinds of capital, domestic as well as foreign. Referring to the analysis provided above we conclude that the majority of developing and emerging economies are dependent on FDI what may directly impact the external debt of the country. The external debt indicator matters to any economy, to be it public or private, due to fiscal and monetary impacts.

Abstract. The article presents the results of the practical implementation of the methodology for assessing the innovative potential of small and medium-sized businesses of the Republic of Kazakhstan. To identify the level of development of innovative activity of SMEs in Kazakhstan the methods of correlation and regression analysis were implemented. The analysis conducted on the basis of available statistical materials discloses the impact of different factors on the innovative potential of small and medium-sized businesses. According to the author's approach to the evaluation of innovative potential, there are three groups of factors affecting the innovative potential – factors of general economic development, factors of development of small and medium-sized businesses and factors of development of research activities. The article also analyzes the main indicators of innovation activity of the considered enterprises and institutional features of their development. The results of the research allowed to identify both the advantages and disadvantages of innovative activity of national SMEs.

Keywords: innovative potential; innovative activity; small and medium-sized business; correlation method; statistical analysis; regression analysis

1. Introduction

In all developed countries of the world, small and medium-sized entrepreneurship (SME) is a powerful engine of innovative development. SME is often the main subject of innovation, being the source and generator of new ideas and innovations. This is facilitated by characteristic features of small and medium-sized businesses such as flexibility in relation to the constantly changing conditions of the external environment, high mobility of resources, efficiency and return of financial resources and a propensity for risk.

In recent decades, research has shown that innovation is a key factor in improving the competitive position of firms. Their innovative ability significantly affects competitiveness, which is based on qualitatively new skills and abilities. The innovation potential for achieving much higher competitiveness means providing less expensive products and services of better quality than those provided by competitors. Therefore, the measurement of innovation potential remains one of the main problems studied by scientists, senior and middle managers.

Particularly for small and medium-sized enterprises, the adoption of best practices in innovation management has played a fundamental role in the growth and progress of these firms, creating new sources of competitive advantages compared to their competitors. Since there are many approaches and methods for researching innovative activities and innovation potential of small and medium-sized enterprises, it is necessary to build the logic of research of the development problem of small and medium-sized enterprises' innovation potential.

2. Literature review

In order to disclose the nature of the given problem and the validity of the studies, an important stage is to review the literature and analyze various view points regarding the concept of "innovation potential of small and medium-sized enterprises". A significant contribution to the development of the modern theory of innovation introduced by Rosenbusch, Brinckmann, Bausch (2011), Dewangan, Godse (2017), Cocca, Alberti (2018), Carpinetti, Gerolamo, Cardoza, Galdamez (2017), Calantone, Cavusgil, Zhao (2018), Xiong, Ye, Wang (2019), Kumar (2019), Mazzoni, (2020) and others who have elaborated on theory of innovative management. The problem of the innovation potential of small and medium-sized enterprises was studied by scientists Zawislak (2018), Hoq, Ha (2019), Maravelakis, Bilalis, Antoniadis, Jones, Moustakis (2016), Manjon, Mompo, Redoli (2016), Leskovar, Baggia, Metlikovič (2018) and others.

The works of scientists Baizholova (2014), Ismailova (2016), Kenzhebayeva (2014), Kurmanov (2015) are devoted to the problem of formation of innovative potential, as well as the assessment of the impact of various factors on its development.

According to the definition of Zawislak (2018) "innovation opportunity" is defined as a process of studying technology, turning into technological development and operational capabilities, and management and transactional procedures.

Moreover, the approach of Hoq, Ha (2019) is also interesting in terms of innovation efficiency for small and medium-sized businesses, according to which the innovation potential of small and medium-sized enterprises includes the following three areas:
1) orientation to social capital, which is a positive attitude and participation of human and social capital in innovation;

2) market orientation, including the ability to respond to market conditions, as well as adapting innovation to changing environmental conditions;
3) entrepreneurial orientation, which includes a proactive attitude of the company to risk and competition.

In the work of Maravelakis, the innovation potential of small business is explained as the ability of the company to identify and perceive business opportunities and effectively implement market innovations (Maravelakis et al., 2016).

Based on a comprehensive analysis of various theoretical approaches, Manjon, Mompo, Redoli formulated the following definition: innovation is a process that is stimulated through the promotion of research and development, the acquisition of technology, human or financial resources that lead to results in the form of product and process innovations or and both of them, i.e. companies engaged in product and process innovation achieve greater efficiency, sales growth, profit and market expansion than companies that do not innovate. (Manjon et al., 2016).

In the work of Glazunova, the innovation potential is explained as the ability and readiness of the organization to use production, labor, intellectual, scientific-technological, marketing, material-energy, infrastructure, financial-economic and managerial resources to implement the innovative development of the organization, ensure its innovative activities and achieve innovative goals. According to this definition, the organization's innovation potential can be represented as a dependence on the potentials of its subsystems (Glazunova 2016):

$$IP = f\,(P_p;\ P_l;\ P_{mar};\ P_r;\ P_{int};\ P_{st};\ P_{fe};\ P_{inv};\ P_{man}) \qquad (1)$$

Where:

P_p - production potential;
P_l - labor potential;
P_{mar} - marketing potential;
P_r - resource potential;
P_{int} - intellectual potential;
P_{st} - scientific and technical potential;
P_{fe} - financial and economic potential;
P_{inv} - investment potential;
P_{man} - management potential.

This approach considers the interaction of the organization's subsystems and the correct assessment of the innovation potential as part of the effective management of the organization's entire innovation activity.

A group of researchers from the Universities of Maribor (Slovenia) and Klagenfurt (Austria) considers the innovation potential of the company as the difference between the two states of the company: its goals and the actual state (Leskovar, Baggia, Metlikovič, 2008).

According to the author's approach of Kuzmina (2012), the innovation potential of the enterprise is one of the important resource components providing leadership in the competitive struggle. The author defines the innovation potential of the enterprise as the aggregate capabilities of the enterprise to achieve certain goals and solve problems of mastering new knowledge with the subsequent implementation process, resulting in new products, technology, process.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

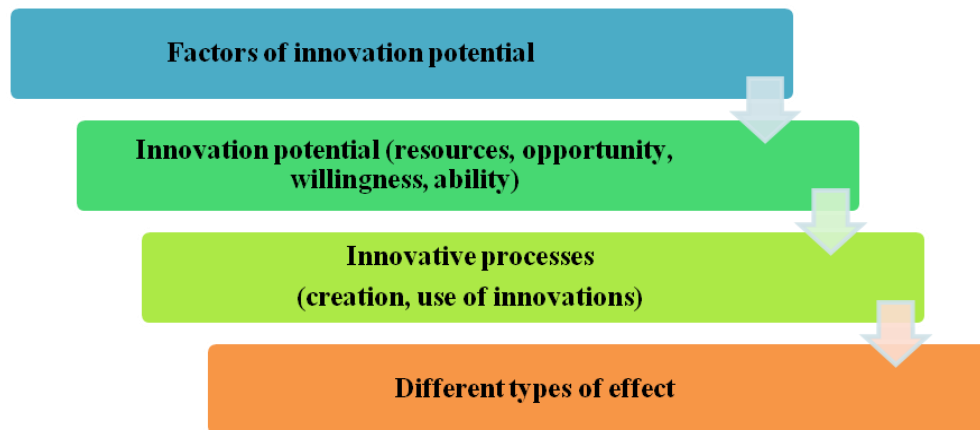
In the work of Lapteva (2014), innovation potential is considered as an opportunity, readiness and the ability of an enterprise to create and use innovations with the available resources to obtain different types of effect (Figure 1).


Figure 1. Innovation potential of the enterprise by Lapteva (2014)
Source: compiled by authors

The interpretation of Askarova (2016), based on the system approach, is also interesting. She proposes the definition of innovative capacity as the ability of the system to transform the actual order of things into a new state in order to meet existing or emerging needs, i.e. this is a kind of characteristic of the system's ability to change, improve, progress.

In general, the review of sources on this issue has shown that all approaches to the nature of innovation potential could be viewed from two aspects: first, innovation potential is a set of resource opportunities that enable the implementation of innovative projects; second, innovation potential as an indicator of the economic potential of the business entity.

Obviously, in order to identify the innovation potential of economic entities, taking into account all the significant indicators that characterize the various aspects of activity and the features of their innovation activities, it is necessary to determine the structure of the innovation potential of enterprises.

A review of the literature that, despite the existence of a wide range of definitions, the concept of "innovation potential of SMEs" does not have a well-developed and substantiated methodology for assessing innovation potential of SMEs. The authors of this study made an attempt to assess innovation potential of SMEs based on factors of influence on innovative products. Based on the set goal, the following tasks were set and solved in the research process: developed a conceptual model for the evaluation of innovation potential of SMEs, the analysis and the estimation of the innovation potential SMEs of Kazakhstan on the basis of three groups of factors: factors of SME development, factors of the General economic development of the country and factors of the development of research activities. On the basis of the results of the study, the identified factors influencing the final result of the innovative activity of SMEs were proposed Innovation activity characterizes the readiness to update the main elements of the innovation system - their knowledge, technological equipment, ICT and the conditions for their effective use, as well as sensitivity to everything new.

## 3. Analysis of the current state

One of the important sectors for the implementation of the strategic objectives of innovative development of the economy of Kazakhstan is small and medium business, which serves as the foundation for ensuring the competitiveness of the economy and improving the welfare of the population of the country. The problem of using and enhancing the innovation potential of small and medium-sized businesses in Kazakhstan is becoming urgent due to the need to increase the role of small and medium business in the economy and the formation and development of innovative activities to increase the economic potential of the country as a whole. To identify the innovation potential of small and medium business in Kazakhstan, the level of their innovation activity in recent years will be analyzed. Innovation activity characterizes the readiness to update the main elements of the innovation system - their knowledge, technological equipment, ICT and the conditions for their effective use, as well as sensitivity to everything new.

According to the Methodology, approved by order of the Chairman of the Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan, the indicator of innovative activity is determined by the ratio of the number of innovatively active enterprises, that is engaged in any types of innovative activity, to the total number of existing enterprises and multiplying by 100 (Methodology for the formation of indicators of statistics of research and development works and innovations).
Figure 2. The level of innovation activities of small and medium-sized enterprises of the Republic of Kazakhstan, in %
Source: compiled by authors according to Methodology for the formation of indicators of statistics of research and development works and innovations

According to the Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan, in 2019 the level of innovation activity of small and medium-sized enterprises increased in comparison with the indicator of five years ago, in particular for small enterprises by 1.9%, for medium-sized enterprises by 7.4%. Including the highest level of innovation activity of medium-sized enterprises (25,2%) rather than small (7,4%). An analysis of changes in the level of innovation activity of small and medium-sized enterprises over the past 5 years shows unstable dynamics (Figure 2).

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810
**Figure 3.** Structure of enterprises of the Republic of Kazakhstan, which have innovations in 2019, %
Source: compiled by authors according to Internet resource of the Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

For completeness, the structure of enterprises that have innovations will be compared. According to the data of 2019, as shown in the diagram (Figure 3), the share of small and medium-sized enterprises that have innovations is lower than the share of large enterprises, which indicates that the main entities of innovation activity in Kazakhstan are mainly large enterprises.

In addition, the development of innovative activities of small and medium-sized businesses in Kazakhstan depends on regional innovation features. So, in the context of regions, small and medium-sized enterprises of Nur-Sultan (14.8%) and East Kazakhstan region (14.9%) are the most innovative, which level is 3.5% higher than the average for the republic. The least innovative are enterprises of West Kazakhstan (5.3%), Mangistau (3.4%) and Shymkent (7.3%) regions (Figure 4).
Figure 4. Level of innovation activity of small and medium-sized enterprises in Kazakhstan in the regional section in 2019, %
Source: compiled by authors according to Internet resource of the Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

Moreover, in order to identify the innovation potential of small and medium-sized businesses in Kazakhstan, we analyzed the level of innovation activity for major types of innovations such as product and process over the past 3 years.

In domestic practice, the calculation of the indicator of innovative activity of enterprises is based on two types of innovations. According to the Methodology for the formation of indicators of statistics of scientific research and experimental design works and innovations (Order No. 232 of the Chairman of the Committee on Statistics of the Ministry of the National Economy of the Republic of Kazakhstan dated from 6 October 2016), the following definitions of product and process innovation are given:
1) product innovation – is the implementation of a product or service that is new or significantly improved in terms of the properties or methods of use, and also includes significant improvements in technical characteristics, components and materials, embedded software, user friendliness or other functional characteristics;
2) process innovation – is the implementation of a new or significantly improved method of production or delivery of the product and includes significant changes in technology, manufacturing equipment and (or) software.
Accordingly, the level of innovation activity is determined by the ratio of the number of enterprises carrying out product and process innovations to the entire number of functioning enterprises

Figure 5. The level of innovation activities of small and medium-sized enterprises in the RK for process and product innovations in 2015-2019, %
Source: compiled by authors according to Internet resource of the Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan

As Figure 5 shows, the level of innovation activity in product and process innovations of medium-sized enterprises is significantly higher than of small enterprises (by 4 times, according to 2019), which indicates that medium-sized enterprises, by virtue of their capabilities, have more innovation potential than small enterprises. As for the dynamics of the level of innovation activity in product and process innovations, there is also a positive tendency for medium-sized enterprises (an average increase of 1.42% per year), while for small enterprises a rise is observed by 1% in 2019 compared to 2017, and a decrease of 0.1% in comparison with 2015.

Summarizing the analysis of the level of innovation activities of small and medium-sized enterprises in Kazakhstan, several important points could be highlighted:
- The innovation potential of small and medium-sized enterprises is significantly lower compared to large enterprises, which indicates the need to formulate and implement a targeted innovation policy in the sphere of small and medium-sized businesses;
- in the context of the intra-sectoral structure, the level of innovation activity of small enterprises in comparison with medium-sized enterprises ought to be better, as evidenced by the data for the last three years, which mainly affects the competitiveness and efficiency of small enterprises as a whole;
- the uneven development of innovation activities of small and medium-sized enterprises by regions, which in turn determines the unevenness of economic development and the resource potential of the regions (the indicator of the region with the highest level of innovation activity (14.9%) is 4.4 times higher than the region with the lowest level (3.4%);
- a significantly low level of product and process innovation of small and medium-sized enterprises, which are basic in the innovation activity of economic entities, providing mainly improvements in the quality of products and raising the technical level of production.

4. Institutional framework for supporting innovation development

An important aspect of supporting the innovative development of SMEs is the creation of specialized structures and institutions that form the infrastructure of innovation activity, among which, first of all, JSC National Innovation Fund (NIF) established in 2003 by the resolution of the Government of the Republic of Kazakhstan dated 30.05. 2003 with 100% state participation in the authorized capital, which was reorganized in 2012 in JSC "National Agency for Technological Development" (NATD - further Agency). The main goal of the activity is coordination of innovative development processes and provision of state information, analytical and investment support. For a relatively short period from the foundation of the Agency, significant results have been achieved, including:

1) the framework of investment support, the Agency provides financing for innovative projects and the creation of venture funds. At the end of 2018, the agency allocated 4.67 billion tenge to finance innovative projects and provide services.

2) the framework of information and analytical support, Agency developed normative documents and state programs. So in 2010, the Government approved the Program for the Development of Innovation and Assistance for Technological Modernization until 2014, and in 2012 the Law of the Republic of Kazakhstan "On State Support of Industrial Innovative Activities" was adopted. Proposals to the Tax Code were formed, according to which enterprises can reduce the taxable base by 50% of the cost of research and development (R & D).

3) the Agency's total investment portfolio as of 2018 is 2.36 billion tenge ($13 million), which includes 5 project companies and 6 venture funds (3 domestic and 3 foreign).

4) the development of the system of commercialization of technologies in 2011, the Agency created 9 commercialization offices with the best research institutes and universities in Kazakhstan, which are the link between science and business in order to promote the results of research activities to the market.

5) in order to stimulate innovation activities, the Agency carries out activities to promote innovation and revitalize the rationalization movement. Annually there are an international innovation congress, competitions of innovative business projects and rationalization solutions, a contest of journalistic materials, as well as exhibitions of domestic innovative projects.

6) 8 regional technology parks and 3 design bureaus are created and are functioning in order to develop the innovation infrastructure, the free economic zone "Park of Innovative Technologies" is functioning on the territory where an innovation cluster on the principle of "education-science-technology-production" is planned to be created.

7) during the period between 2011 and 2015, the Agency set up five international technology transfer centers in Korea, China, the USA, Russia and France to implement and promote joint technology transfer projects. As a result, 15 Kazakh enterprises were assisted in the transfer of technology in the region of the mining and metallurgical complex, agriculture, power engineering and machine building, etc. (The development strategy of the joint stock company "National Agency for Technological Development" for 2014-2023).

In addition to the National Agency for Technological Development, in order to promote the development of priority, initiative, risk research and development work in 2006, JSC "Science Foundation" was established. According to the decision of the Higher Scientific and Technical Commission under the Government of the Republic of Kazakhstan dated 21.04.2011, the priority areas of the investment activity of the Science Foundation are: energy, deep processing of raw materials and products, information and telecommunication technologies, life sciences, intellectual potential of the country. The Fund provides loans to scientists in the amount of 50 thousand to 2 million US dollars, planning to establish an enterprise or to realize the results of its research activities for 3-5 years. During the 10 years of its activity, the Fund has financed 22 research projects for a total amount of 242.2 million tenge ($ 752,000) and provided innovative grants for financing 28 projects for 690.2 million tenge ($ 2.1

million). Another important player on the innovation field is the Development Bank of Kazakhstan, which was founded in 2001. The Bank renders financial support to the private sector and state organizations in the implementation of infrastructure projects and lending to industrial enterprises. In the framework of GPIFIR, the Bank participated in the implementation of 22 investment projects with a total value of more than 5.6 billion US dollars, of which 3.8 billion US dollars was allocated by the Bank. Among them there are strategically important projects such as Kazakhstan Electrolysis Plant, Kazakhstan Petrochemical Industries, Atyrau Oil Refinery and others.

Entrepreneurship Development Fund "Damu" was established in 1997 with the aim of financial and non-financial support the small and medium-sized enterprises (SMEs), as well as stimulating demand for their products. Initially, Damu was responsible for managing public funds received on credit from the Asian Development Bank (ADB) and the European Bank for Reconstruction and Development (EBRD). In 2002, the Fund began direct financing of SMEs at its own expense. Over the years of the foundation's work, they received financial support for a total of 1,505 billion tenge ($ 4.6 billion) of about 31,000 SMEs. Most of these funds (approximately 70%) were used on stabilization programs to support enterprises affected by the financial crisis through interest rate subsidies, loan guarantees, charter capital, etc. Priority is given to regional support programs, financing of the real production sector, women's entrepreneurship, as well as leasing financing for SMEs. Since 2009, Damu also provides non-financial support, which includes training and consulting services, business plan preparation services, the creation of a nationwide network of business support centers.

The Investment Fund of Kazakhstan (IFK) was established in 2003 for private investments into share capital. IFK is engaged with investing in new and existing companies that deal with the processing of raw materials, using new technologies. The Fund also finances investment projects abroad in the framework of industrial cooperation between national and foreign companies (Kulmaganbetova, 2013).

5   Methodology

The methodology of this study includes the study of theoretical approaches to the assessment of innovation potential, as well as the collection of necessary statistical data for its implementation. During the formulation of the problem in question, the task was set to identify the main groups of factors affecting the indicator of innovation potential of small and medium-sized businesses in the Republic of Kazakhstan, as an indicator of the volume of manufactured innovative products. The basis for this approach to the choice of the indicator of innovation potential of enterprises is the evolutionary theory of factors of production, according to which the produced product is considered as a function of the aggregate of resource (human, technical, technological, material, institutional, organizational and information) opportunities of production. In this paper, it is proposed to consider the volume of innovative products as a result of the implementation of the innovation potential (Inshakov, 2006).

Using the proposed methodology for evaluating innovation potential, there was a study conducted of the impact of factors on the volume of produced innovative products by small and medium-sized enterprises in Kazakhstan using statistical analysis applying the PSPP package. At the initial stage of the study, official statistical data for the period of 2010-2019 were collected and processed by the Committee on Statistics of the Ministry of National Economy of the Republic of Kazakhstan in the public domain.

An empirical analysis of the available data allowed to develop a conceptual model of the connectivity of the innovation potential of small and medium-sized enterprises with the factors grouped as follows (Table 1):

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

Table 1. Factors affecting the innovation potential of small and medium-sized enterprises

Name of group	Factors
Factors of development of small and medium-sized enterprises	1. The number of SMEs 2. The share of SMEs in GDP 3. The level of employment in SMEs 4. The volume of production of SMEs 5. Fixed assets of small and medium-sized enterprises
Factors of General economic development of the country	1. Volume of GDP 2. The share of innovative products produced in GDP 3. Costs of production of innovative products 4. The volume of production of industrial products 5. Investments in fixed assets 6. The inflow of foreign direct investment
Factors in the development of research activities	1. The number of employees performing R&D 2. Expenditures on R&D 3. The share of R&D expenditure in GDP 4. The number of organizations conducting R&D 5. The average monthly wage of employed R&D 6. The volume of produced innovation products 7. The number of students and doctoral students of higher educational institutions 8. The number of teaching staff of higher educational institutions

Source: compiled by authors

A review of the literature on the problem under study showed that there is no unified methodology for assessing innovative potential that reveals the features of its development at all levels. Taking into account the above, the authors propose a grouping of factors influencing the innovative potential of SMEs at the macro, micro and meso levels.

1 group - the factors of small and medium-sized business development that determine the necessary conditions for the development of innovative activities of SMEs and include the number of SMEs, the share of SMEs in the country's GDP, the level of employment in SMEs, the volume of SMEs production, the availability of fixed assets of small and medium-sized enterprises;

2 group - factors of the country's overall economic development are considered as factors determining the potential of the national economy, an important part of which is small and medium business and provides effective innovation activities. Among these factors, there are the volume of GDP, the share of innovative products produced in GDP, the costs of production of innovative products, the volume of industrial production, investment in fixed assets, the inflow of foreign direct investment;

3 group - the factors of the development of research activities are factors determining the level of development of science and technology, which are the basis for the implementation of innovative activities at SMEs. It includes the number of employees performing R&D, R&D expenditures, the share of R&D expenditures in GDP, the number of R&D organizations, the level of wages of R&D workers, the volume of innovative products produced, the number of students in higher education institutions, the number of professors and instructors of higher education institutions, etc.

6. Results

For further evaluation, a correlation matrix was constructed that made it possible to determine the 13 variables associated with the volume of produced innovative products by small and medium-sized enterprises in Kazakhstan (Table 2).

Table 2. Variables associated with the volume of innovative products produced by SMEs in Kazakhstan

Indicators	Correlation coefficient
1. Number of SMEs	0,83
2. The share of SMEs in the country's GDP	0,77
3. Number of employees in the SME	0,82
4. Production of SMEs	0,93
5. Volume of GDP	0,94
6. Costs for product and process innovation	0,73
7. Volume of production of industrial products	0,83
8. Investments in fixed assets	0,92
9. Average monthly wage of employed R&D	0,92
10. Costs of R&D	0,7
11. Volume of produced innovation products	0,92
12. Number of doctoral students of higher educational institutions	0,95
13. Fixed assets of small and medium-sized enterprises	0,8

Source: compiled by authors

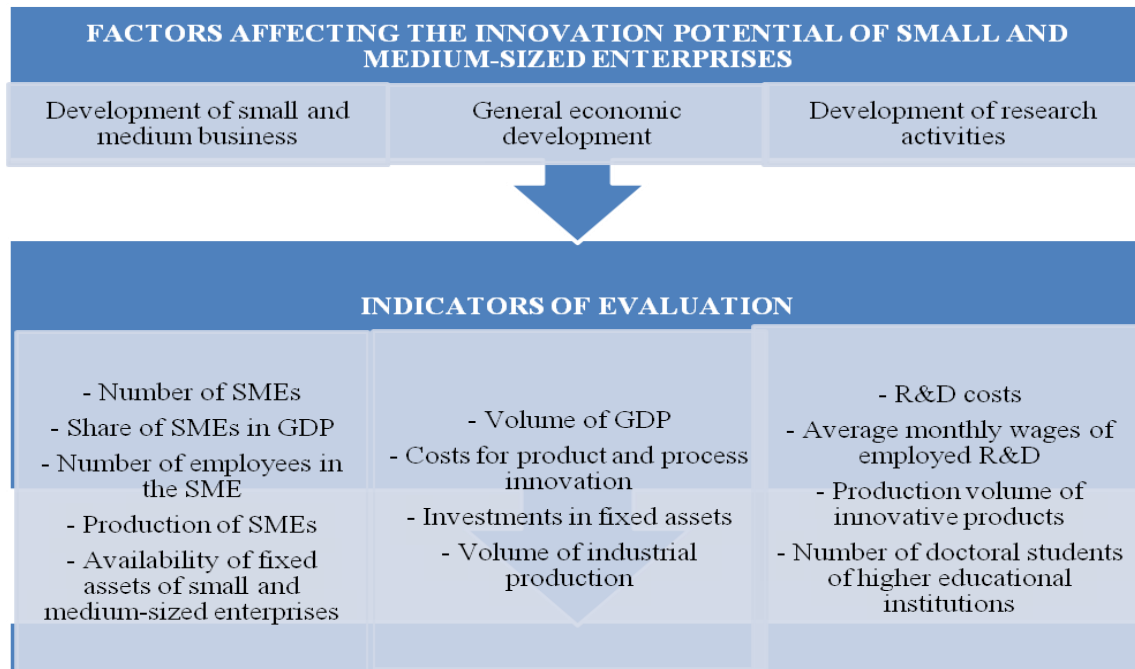
Based on the results of checking the coherence and consistency of statistical indicators using methods of measurement theory and correlation analysis, the authors developed a model for assessing the influence of factors on the innovation potential of small and medium-sized enterprises (Figure 6).


Figure 6. The model for assessing the impact of factors on the innovation potential of SMEs
Source: compiled by authors

The grouping of variables into the appropriate groups was carried out on the basis of an assessment of the internal consistency (reliability, consistency) of the indicators included in the group. For this purpose, the Cronbach alpha

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

coefficient was calculated in the PSPP program, which characterizes the internal consistency (homogeneity) of the variables (Dubina, 2010).

To form groups of internally consistent indicators, the following property of the alpha coefficient was used. If you exclude any indicator from the group, the alpha coefficient will change (decrease or increase). With the exclusion of indicators that do not contradict other indicators (in the sense that they are all aimed at measuring the general factor), the Cronbach alpha coefficient decreases. And, on the contrary, if you exclude indicators that do not agree with others, the value of the alpha coefficient will increase. The Cronbach alpha coefficient takes values in the range from 0 to 1. It is considered that the values of α 0.6 indicate a fairly acceptable measurement consistency, and the values α 0.8 characterize good consistency (Dubina, 2010).

Thus, it was possible to form three groups of variables corresponding to 3 factors (Figure 6). For variables (economic indicators) included in the first group (development of small and medium businesses), the alpha coefficient was 0.98. For the second group (general economic development) and the third group (Development of R&D), this figure is 0.95.

So, a model coordinated and collated by indicators has been constructed, it describes the relationship of the evaluation indicators to the main groups of factors affecting the innovation potential of small and medium-sized enterprises.

To determine the degree of influence of changes in independent variables (X) on the volume of innovative products produced (Y) by small and medium-sized enterprises in Kazakhstan, the pairwise linear regression method is applied (Table 3). Pairwise regression models were constructed, since the multiple regression models are statistically insignificant due to the multicollinearity effect (the connectivity of the attributes included in the model) (Dubina 2010).

In this study, the hypothesis is to determine the degree of influence of changes in factors on the final result of innovative activities of SMEs.
As a result of the simulation, the following equations of pair regression were obtained:

1. $Y = -195347,79 + 0,37X_1 \pm 56150,48$; X_1 – Number of SMEs
2. $Y = -160363,33 + 14396,71X_2 \pm 63500$; X_2 – The share of SMEs in GDP
3. $Y = -423798,9 + 0,21X_3 \pm 57564,5$; X_3 - Number of employees in the SME
4. $Y = -43481,2 + 0,02X_4 \pm 37070,6$; X_4 - Production of SMEs
5. $Y = 12130,42 + 0,01X_5 \pm 60598,7$; X_5 – Fixed assets of small and medium-sized enterprises
6. $Y = -201343,92 + 0,01X_6 \pm 71508,3$; X_6 – Costs of R&D
7. $Y = -97887,83 + 7,48X_7 \pm 35241,46$; X_7 – Volume of GDP
8. $Y = -121063,74 + 1,81X_8 \pm 39283,88$; X_8 – Average monthly wage of employed R&D
9. $Y = -21573,91 + 0,46X_9 \pm 40086,65$; X_9 – Volume of produced innovation products
10. $Y = -31794,07 + 110,52X_{10} \pm 31448,93$; X_{10} – Number of doctoral students
11. $Y = -230722 + 0,06X_{11} \pm 38791,36$; X_{11} – Investments in fixed assets
12. $Y = -155274,34 + 0,02X_{12} \pm 55639,15$; X_{12} – Volume of production of industrial products
13. $Y = 54932,69 + 0,16X_{13} \pm 68029,74$; X_{13} – Costs for product and process innovation

Source: compiled by authors

The parameters of the constructed regression models allow us to compare the connectedness of the variability of the effective indicator (the volume of the innovative products produced) with the variability of the corresponding indicators. This connectivity could also be interpreted as the degree of influence of factor characteristics on the outcome. Thus, the emergence of each new enterprise in the SME will lead to an increase in the volume of innovative products by an average of 370 thousand tenge ($ 1,1 thousand), an increase in the share of SMEs in GDP by 1% - by 14,396 billion tenge ($ 44.7 million), an increase in the number of people employed in SMEs by 1 person - by 210 thousand tenge ($ 652), an increase in R&D expenses by 1,000 tenge ($ 3) - by 10,000 tenge ($ 31), an increase in GDP by 1 billion tenge ($ 3.1 million) - by 7.48 million tenge ($ 23.2 thousand), an increase in the average monthly salary of employed R&D by 1,000 tenge ($ 3) - by 1.81 million tenge (5,6 thousand dollars), an increase in the number of doctoral candidates by 1 person will lead to an increase in the volume of innovative products by an average of 110.52 million tenge ($ 343.2 thousand).

In order to analyze the influence of different groups of factors on the volume of produced innovative products, small and medium-sized enterprises calculated the aggregated indicators for each group of factors, the degree of correlation that is quite high with the volume of innovative products produced, which demonstrates the compatibility of integrated factors for characterizing the innovation activity of SMEs (Table 4).

Aggregated indices were calculated from the corresponding groups with high internal consistency (reliability), determined using the Cronbach alpha coefficient. Since the indicators in the group have different scale and dimension, they were reduced to a standard z-distribution with an average of 0 and a standard deviation of 1:

$$R_{nz} = \frac{R_c - m}{s},$$

Where:

R_{nz} - is the z-normalized value of the indicator for the analyzed group;
R_c - is the initial value of the indicator for the analyzed group;
m - is the average value for the characteristic in the group;
s - is the standard deviation for the characteristic in the group.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

With this transformation, the indicators with values less than the average for the group will have negative values, with large - positive.
As a result, sets of values of three indices corresponding to three groups of analyzed factors were obtained.

Table 4. Parameters of the degree of dependence of the volume of innovation products produced from different groups of factors

Group of factors	Alpha Cronbach (reliability)	Correlation with aggregated index	Closeness of the relationship between the aggregated indicator and the dependent variable
Factors of development of small and medium business	0,98	0,87	75,69%
Factors of General economic development of the country	0,95	0,88	77,44%
The factors in the development of research activities	0,95	0,93	86,49%

Source: compiled by authors

Correlation-regression analysis showed the presence of very high bonds of aggregated indices with the result of innovation activity of SMEs. Thus, the variability of the output of innovative products by small and medium-sized enterprises in Kazakhstan depends on 75.7% of the development factors of small and medium-sized businesses, by 77.44% of the factors of the general economic development, the highest degree of cohesiveness has been found with the factors of development of research activities (86.5%).

7. Conclusion

Based on the assessment, it was revealed that the closeness of the relationship of the aggregated indicator for micro-level factors was 86.49%, meso-level factors 75, 69% and macro-level factors 77.44%. This means that for the development of innovation potential of SME, the factors of development of research activities are of the greatest importance, and the factors of development of small and medium-sized businesses are of the least importance.
The conducted studies made it possible to conclude that in assessing the innovation potential of SMEs, the key point is the opportunities for innovative development of small and medium-sized enterprises, which ultimately are expressed by the volume of innovative products produced by them.

On the basis of the correlation-regression analysis of the influence of factors on the effectiveness of innovation activity of small and medium-sized businesses, it was possible to develop a conceptual model for assessing the innovation potential of SMEs in the Republic of Kazakhstan, which includes three main groups of indicators, namely, the group of "SME development indicators", indicators of the "general economic development of the country" and a group of "indicators of scientific and innovation activities". The conceptual model allows to integrate the results of innovation activities of enterprises and existing conditions for its development both at the macrolevel and at the sectoral level.

Also, during the research it was revealed that the volume of produced innovative products by SMEs in Kazakhstan is most influenced by factors such as the volume of GDP produced in the country (correlation coefficient - 0.94), the volume of products produced by SMEs (correlation coefficient - 0.93), the volume of

innovative products produced in the economy in general (correlation coefficient - 0.92), the volume of investment in fixed assets (correlation coefficient - 0.92), and the level of wages engaged in R&D (correlation coefficient - 0.92).

In addition, as shown by the correlation analysis, there is a very weak relationship between the result of innovation activity of small and medium-sized enterprises with such factors as the number of workers performing R&D, the share of R&D expenditures in GDP, the number of organizations performing R&D, the share of innovative products produced in GDP, the teaching staff of higher education institutions, and the influx of foreign direct investment. As one of the main reasons for the low degree of coherence of the outcome indicator with factorial, the so-called "deferred effect" of the influence, which in innovation activities manifests itself after a certain period of time, is considered.

On the basis of the construction of the pair regression model, it has been established that SMEs, the share of SMEs in GDP, the number of people employed in SMEs, the cost of R&D, the volume of GDP, the average monthly salary of employed R&D, the number of doctoral candidates, have a significant impact on the volume of SMEs produced by innovative products. The degree of influence of the relevant factors is also determined.

Proceeding from the results of the assessment of the influence of factors on the results of innovation activity of SMEs subjects, the most important problems are identified, which need to be paid attention to further enhance their innovation potential:
- the need to increase the level of innovation activities of SMEs by encouraging the creation of innovative enterprises;
- the need to create conditions for the development of SMEs to increase the share of SMEs in the production of the country's GDP;
- increase in the level of employment in the SME, which is expressed by the increase of labor potential, which is an important component of the whole SME potential;
- stimulation of financing of research and development activities of small and medium-sized enterprises, designed for a long-term perspective of innovation;
- the solution of the most important issues in the staffing of innovation activities of SMEs, in particular the increase of wages of employed R&D, the provision of science personnel to SMEs.
The novelty of this study lies in the development of a system of factors affecting the innovation potential of SME and its assessment using the economic and statistical method.

Abstract. There are a big number of researches which analyzing stock price returns. Some of them is based on fundamental analysis theory. Meanwhile other studies are based on efficient market hypotheses and financial behavior theories. However, there is not enough researches combining the characteristics of these theories into one. Such kind of researches in the scientific literature is usually referred to macroeconomic news, announcements, surprises, expectations studies. These studies examine not only the actual but also the predictive values of macroeconomic indicators announcements, normalizing them and thus creating absolutely a new surprise indicator. Purpose of this paper is modeling EURO STOXX 50 index price returns based on Industrial production surprise indicator. Empirical part shows that the best models for explaining EURO STOXX 50 index price returns was obtained at the 40 and 42 in different surprise indicator scenario. The coefficient of determination was obtained respectively 24.70% and 21,80%. Meanwhile applying machine learning method of artificial intelligence, a much more accurate models were obtained. The coefficient of determination respectively was 33,22% and 26,60%.

Keywords: surprises; price; return; EURO STOXX 50; Industrial production

JEL Classifications: L16, P22.

Additional disciplines: mathematics, statistics, law

1. Introduction

Attempts to explain and predict changes of stock price returns have been trying for decades. Some of them is based on fundamental analysis theory (Tetteh, et. al., 2019; Abed, Zardoub, 2019; Ho, 2018). Meanwhile other studies are based on efficient market hypotheses (Altinkilic, et. al., 2015; Fama and French, 2015; Yen and Lee, 2008) and financial behavior theories (Kozel, 2015; Pasquariello, 2014; Nawrocki and Viole, 2014). However, there are not enough researches combining the characteristics of these theories into one. Such kind of researches in the scientific literature is usually referred to macroeconomic news, announcements, surprises, expectations studies (Alexiou, et. al., 2018; Cakan, Gupta 2017; Nadleri, and Schmidti, 2016; Chen, et. al., 2015; Miao, et. al., 2014; Gurgul, Wójtowicz, 2014; Harju, Hussain, 2011; Gupta, Reid 2012; Hussain, 2010; Masood et al., 2020 and others). These studies examine not only the actual but also the predictive values of macroeconomic indicators announcements, normalizing them and thus creating absolutely a new surprise indicator.

However, the high frequencies analysis is not sufficiently developed in those studies. As a result, it becomes unclear how quickly the stock price returns adapt to the economic indicators announcements. The above-mentioned studies examine the stock markets of the USA, South Africa, Poland, and China, but there is a lack of research examining the stock market of the Eurozone. None of them uses scenario analysis. There is also not enough research to model stock price returns based on Industrial production announcements. Lastly, there are not enough studies which modeling stock price returns based on basic and machine learnings methods and at the same time compared them to each other. By reasons mention above a scientific problem is formulated further. What is the specificity of economic indicators surprises and how to model stock price returns based on Industrial production surprises?

The main purpose of the article is to construct, test, analyze and compare models for predicting the impact of industrial production surprises on EURO STOXX 50 returns changes based on basic and machine learning approaches. The following tasks are pursued: 1. To reveal the methods of modeling stock price returns based on economic indicators surprises and to review legal regulations related to securities in the EU and the USA. 2. To create methodology for modeling stock price returns based on economic indicators surprises. 3. To construct, test, analyze and compare models for predicting EURO STOXX 50 index price returns based on Industrial production surprises.

Research methods: 1. Systematic analysis of the scientific and law literature. 2. Comparative analysis. 3. Correlation analysis. 4. Analytical-logical method. 5. High frequency data analysis. Regression analysis based on OLS method (both basic and machine learning approaches)

2. Literature review: modeling stock returns based on economic indicator's surprises

Studies which is aimed at modeling changes in stock price returns and incorporating individual elements of fundamental analysis, efficient market hypotheses and financial behavior theories in the scientific literature is usually referred to macroeconomic news, announcements, surprises, expectations studies (Zhai, et. al., 2020).

Researchers Alexiou, et. al. (2018) analyzed the response of 25 equity portfolios to macroeconomic surprises spanning the period from April 1998 until May 2017. The three methodological methods used in this study which shown that the ISM Institute of Supply Management non-manufacturing index, the number of employees working in the non-agricultural sector (employees on non-farm payrolls), retail sales, personal consumption personal

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

consumption expenditure and initial jobless claims have a significant impact on portfolio returns. It was also found that the surprises in the ISM non-production index, personal consumption expenditure and unemployment claims indicators shape certain trends in various portfolios. It is observed that by creating portfolios with companies that have higher operating profitability and investment level, the investor can potentially reduce the risk of volatility arising from the above three macroeconomic indicators.

The US macroeconomic indicators such as "PPI, CPI, state employment, employment situations, labour turnover, and job openings, US export/imports, unemployment, real earnings, earnings of wages and salary, business employment dynamics and employment cost index" and their uncertainty play a significant role in the equity market and other markets (Shaikh, 2020). Cakan and Gupta (2017) modeled the impact of U.S. inflation and unemployment rate surprises on South African stock price volatility. The study found that bad news about U.S. inflation does not affect the volatility of South African stock returns, while good news increases volatility. It has also been studied that the country's stock market fluctuates more with an unexpected rise in the U.S. unemployment rate and fluctuates less with an unexpected decline in the U.S. unemployment rate. And even more the last effect being stronger than the former. Thus, an unexpected slowdown in inflation and an increase in the unemployment rate increase stock market instability, which in turn would mean that financial conditions in the country would deteriorate and adversely affect the real economy, according to researchers. Meanwhile, positive surprises in US inflation and employment are contributing to more stable, and therefore less volatile, stock markets in developing countries.

Researchers Nadleri and Schmidti (2016) analyzed the response of the ETF's price to macroeconomic surprises spanning the period from January 2009 until July 2013. It was found that the average daily return of the ETF's on the days of publication of indicators may be significantly higher than the buy-and-hold strategy, although their difference may be statistically insignificant. It was observed that the surprises of the ISM Manufacturing index of non-agricultural employees Non-Farm Payrolls, International Trade Balance, Index of Leading Indicators, Housing Starts and Jobless Claims have the largest and statistically significant impact to ETF's.

Researchers Chen, et. al. (2015) examine the role of investor attention in planned macroeconomic reports to explain price fluctuations in China's future stock index. It has been observed that the attention of investors, as indicated by the Baidu search index, is the highest in anticipation of the consumer price index. Only the CPI has been found to have a significant short-term impact on the price, liquidity, and volatility of the CSI 300 futures index. In addition, price fluctuations in the CSI index are greater in the face of bad CPI surprises and a period of high inflation.

Researchers Miao, et. al. (2014) analyze the impact of macroeconomic indicators on the futures price of the S&P 500 index. Research confirms a strong correlation between macroeconomic indicators and index price fluctuations. More than 60% of jumps between 10:00 and 10:05 and more than 75% of jumps between 8:30 and 8:35 are related to one or more indicators released at 10:00 and 10:30 respectively. Attention is also drawn to the positive impact of surprises in GDP (GDP), the production price index (PPI), factory orders and CPI, advanced retail sales on the S&P 500 index prices.

Gurgul and Wójtowicz (2014) analyzed the impact of US macroeconomic indicators on the price changes of four Warsaw stock indices (WSE, WIG20, WIG40, WIG80). Stock index price changes were analyzed 1 minute after the indicator appears. Consumer price index, producer price index, indicators were observed to be below expert forecasts and durable goods orders, retail sales, industrial production, number of employees in the non-agricultural sector announcements above expert forecasts are times of good news and have a positive impact on

the price of the WSE stock index. It was also observed that the price of the WIG20 stock index reacts more sensitively than the WIG40, WIG80 indices after the first minute of the news.

U.S. Securities and Exchange Commission is responsible for investor oversight. The mission of the U.S. Securities and Exchange Commission is to protect investors, maintain fair, orderly, and efficient markets, and facilitate capital formation. The world of investing is fascinating and complex, and it can be very fruitful. But unlike the banking world, where deposits are guaranteed by the federal government, stocks, bonds and other securities can lose value. There are no guarantees. By far the best way for investors to protect the money they put into the securities markets is to do research and ask questions.

The laws and rules that govern the securities industry in the United States derive from a simple and straightforward concept: all investors, whether large institutions or private individuals, should have access to certain basic facts about an investment prior to buying it, and so long as they hold it. To achieve this, the SEC requires public companies to disclose meaningful financial and other information to the public. This provides a common pool of knowledge for all investors to use to judge for themselves whether to buy, sell, or hold a particular security. Only through the steady flow of timely, comprehensive, and accurate information can people make sound investment decisions (U.S. Securities and Exchange Commission, 2020).

MiFID II (Markets in Financial Instruments Directive) and MiFIR (Markets in Financial Instruments Regulation) started to apply in January 2018, bringing significant improvements to the functioning and transparency of EU financial markets. Right now, the consultations on improving these legal instruments are taking place. Under MiFID II it is more difficult for national regulatory authorities to waive the pre-trade transparency obligations in respect of listed shares. The pre-trade transparency obligations have been extended to financial instruments other than listed shares. MiFID II distinguishes in this connection between equity and non-equity instruments. Equity instruments are shares, depositary receipts, ETFs, certificates and other similar financial instruments. Non-equity instruments are bonds, structured finance products, emission allowances and derivatives (Busch, 2017). MiFIR introduced wide-ranging pre-trade and post-trade transparency requirements to EU markets.

In United States of America, The Economic Growth, Regulatory Relief, and Consumer Protection Act introduced relaxed rules on financial institutions in year 2018. A revised framework for applying prudential standards for U.S. financial institutions have been established. Still legal regulation in U.S. is quite variegated and complicated. It is believed (Kress, Turk, 2020) that policymakers have effectively ignored potential adverse consequences of looser financial institutions oversight. While reducing examination frequency and reporting requirements will lessen banks' administrative burden, the trade-off will be increased societal costs in the form of excessive risk taking and more frequent bank failures.

Gupta and Reid (2012) in their work investigated the impact of macroeconomic indicator surprises on changes in the price indices of South African industrial stocks. A study conducted using the event study method shows that in the long run, only the surprises of consumer price index (CPI) indicators significantly and negatively affect the return of stock indices. Meanwhile, a study conducted by Bayesian Vector Autoregressive analysis shows that surprises in the production price index (PPI) also have a significant impact on stock index prices. It is true that in the last method, the volatility of the prices of both CPI and PPI stock indices is short-lived - as soon as the indicators appear.

Researchers Harju and Hussain (2011) in their work analyze the impact of macroeconomic indicator's surprises on the largest fluctuations in European indices prices. The authors analyzed the changes in stock index prices 5

minutes after the indicator appears. The findings of the study show that the price volatility of European indices increases significantly with the start of U.S. trading. Unexpected macroeconomic indicators also have a direct and significant impact on the daily returns and changes in European stock indices. According to the researchers, the research suggests that interdependencies in the stock market between the U.S. and Europe should be further explored. Also, strong daily fluctuations in stock indices in the European market have a significant impetus for researchers and investors not only to analyze and model short-term index returns, but also the dynamics of the behavior of financial market participants. The EU has established a comprehensive set of rules on investment services and activities with the aim to promote financial markets that are fair, transparent, efficient, integrated. The first set of rules adopted by the EU helped to increase the competitiveness of financial markets by creating a single market for investment services and activities. They also ensured a high degree of harmonised protection for investors in financial instruments, such as shares, bonds or derivatives (European Commission, 2020).

Hussain (2010) in his own article examined the impact of European and U.S. monetary policy indicator's surprises on indices prices in these markets. Stock indices price changes were analyzed 5 minutes after the indicator appears. The study shows that surprises in monetary policy indicators have a significant impact on the price and volatility of indices. In addition, the author noted that the press conference of the European Central Bank (ECB), which takes place 45 minutes after the same day's monetary policy decisions, also has a significant impact on the price and volatility of European stock indices.

Looking at the scientific literature above, we see that researchers get quite different stock return results with different economic indicators. In some cases, surprises in economic indicators have a positive effect on stock returns, while in others they have a negative effect. All the studies include at least a few indicator surprises and model their impact on stock returns. It has been observed that the results are quite contradictory regarding the industrial production indicator. Researchers agree that, in theory, better-than-expected news on this indicator should have a positive impact on stock returns, but the results are contradictory. Researchers Alexiou, et. al. (2018) found a positive but not statistically significant relationship when examining the impact of industrial output surprises on the stock market. Nadleri and Schmidti (2016), meanwhile, demonstrated that the relationship is negative but insignificant. Other researchers Chen, et. al. (2015) found a negative and at the same time statistically insignificant relationship when examining the Chinese stock market. In the European market, according to U.S. the surprise of the industrial production indicator, researchers Gurgul and Wójtowicz (2014) and Harju and Hussain (2011) obtained positive and statistically significant results. Thus, as can be seen, the results are quite contradictory, therefore, in the opinion of the authors, it would be relevant to examine the surprises of this indicator separately from other indicators. Also, as can be seen, many researchers study U.S. indicator's and its markets, but a few is done on the European indicators and its market, so in this study we are going to modeling European stock market returns based on European industrial indicator.

Moving on to a more detailed analysis of researches mentioned above it is worth presenting the methods used by scientists on this topic.

Table 1. Stock price returns analysis methods based on economic indicator's surprises

Years	Authors	Research period	Data frequency	Research methods (in short)
2018	Alexiou, et. al.	1998 - 2017	Daily	- REGRESSION (OLS) - SUR - MM WEIGHTED LEAST SQUARES
2017	Cakan, Gupta	1994 - 2016	Daily	- GJR-GARCH
2016	Nadleri, Schmidti	2009 - 2013	Daily	- ARMA – GARCH
2015	Chen, et. al.	2011 - 2014	Minute	- REGRESSION
2014	Miao, et. al.	2003 - 2010	Minute	- REGRESSION
2014	Gurgul, Wójtowicz	2007 - 2013	Minute	- ES - ARMA
2012	Gupta, Reid	2002 - 2011	Daily	- BVAR - REGRESSION - ES
2011	Harju, Hussain	2000 - 2006	Minute	- ARMA – GARCH
2010	Hussain	2000 - 2008	Minute	- ARMA – GARCH

*REGRESSION (OLS) – regression analysis ordinary least square method
*GJD - Generic jump-diffusion method
*GARCH - Generalized Autoregressive Conditional Heteroskedasticity method
*ARMA - Autoregressive–moving-average method
*ES - Event studies method
*BVAR - Bayesian Vector Autoregressive method

Source: compiled by the authors based on the above sources

The table 1 above shows that the average period of research is 9 years. Thus, the developed models cover several periods of the economic cycle, which is good because ups and downs are estimated. By data frequency, authors collect daily and minute stock price data. The choice of data frequency type usually depends on whether data is easy to obtain. Usually use more frequency data leads to the more reliable models. Thus, according to the above-mentioned studies, the most objective models are based on per-minute stock price data. From table above was noticed that many researchers are calculating surprise indicator which shows how economic announcements impact stock price returns (see Formula 1)

$$S_{k,t} = \frac{A_{k,t} - E_{k,t}}{\hat{\sigma}_k} ; \quad \hat{\sigma}_k = \sqrt{var(A_{k,t} - E_{k,t})} ; \quad (1)$$

From here:
$S_{k,t}$ - standardized surprise value of the economic indicator k, on the trading day t.
$A_{k,t}$ - the actual value of the economic indicator k, on the trading day t.
$E_{k,t}$ - the predictive value of the economic indicator, which is obtained by interviewing experts, household, or business.
$\hat{\sigma}_k$ - standard deviation of the surprise value of the economic indicators k.

Although as we can see from table 2 the methods are diverse, the authors usually choose regression analysis or ARMA-GARCH methods to do their research. The ARMA-GARCH model is usually used to analyze continuous time series when the model equation also includes fluctuations the values of a variable for a previous period. For this reason, this method is not suitable for this case because past stock price returns are not examined in this work. Therefore, one of the research methods chosen in this study is the least square method (OLS). The second method that the authors have chosen and that is innovative is the machine learning method. It is a method belonging to the class of artificial intelligence methods, which is characterized not by a direct solution of the problem, but by learning. None of the mention scientists have used this method and this is a novelty of this study. The use of these two methods will allow to choose and understand which, the model is better on this problem

Research limitation / assumption: We assume that only surprises in economic indicators can affect stock returns and other factors are not included in the model.

3. Research methodology

Regression analysis is used to investigate the dependence of one variable on one or more variables and to predict subsequent mean values of the variables. To construct regression models, it is necessary to perform whether a data is passing regression analysis assumptions.
1. Whether the dependent variable is normally distributed. In this paper we are using Shapiro-Wilk test. A test p value of ≥ 0.05 indicates that the standardized errors are normal.
2. Whether the residual errors of the different observations are not correlated. In this paper Durbin-Watson statistic are used. If the value obtained is between 1.5 and 2.5, it usually means no autocorrelation.
3. Whether the regressors correlate with each other. In this paper we are NOT calculating variance reduction coefficient (VIF) because we have just one regressor.
4. Whether there are outliers in the data. In this paper the Cook measure is calculated. Cook measure calculated for each set of regressors. If the sample size is n, then the cook's measure will be n as well. If the value of n of at least one cook measure exceeds 1, it is said that there are outliers in the data.
5. Whether the data are homoscedastic. In this paper we calculated by the Breusch-Pagan test. If the test p value is ≥ 0.05 then the data are homoscedastic (no heteroskedasticity).

After checking whether the data are suitable for constructing a regression model, the model itself is further constructed. The regression model is usually described by the following indicators:
1. Coefficient of determination (R^2). This is the most important indicator of model confidence in the data, which is mandatory in all descriptions of regression models. The interpretation of R^2 is as follows - what percentage of Y's behavior is explained by the behavior of the variables X, Z, W. The coefficient of determination values acquires between 0 and 1. The higher value indicates more reliable model.
2. T - (Student's) test for each regressor. It helps to decide if a regressor is statistically significant or not. If the value of the regressor p is <0.05, then we can say that the regressor is statistically significant and we do not delete it. If the value of the regressor p is ≥ 0.05, then the regressor is statistically insignificant and we remove it from the model.

The EURO STOXX 50 stock index price returns were modeling in this paper. The analysis period between 2008-02-29 - 2019-10-01, and the frequency of the data is minutes. The data was obtained from the Bloomberg terminal, which includes the following information: index opening price and closing price. Having the closing and opening price of an index minute, it is possible to calculate the price return of an index for a specific minute, which is the dependent variable of the model to be predicted. The return on the index is calculated further

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

$$G_m = \frac{U_m - A_m}{A_m} \times 100 \qquad (2)$$

From here:

G_m % – EURO STOXX 50 index return on minute (m).

U_m – EURO STOXX 50 index close price on minute (m).

A_m – EURO STOXX 50 index open price on minute (m).

As mentioned before EURO STOXX 50 stock price returns are modeling which is based on Industrial production surprises. This indicator reflects the state of the industrial sector. The industrial sector includes manufacturing, mining, and utilities. Although these sectors account for only a small share of GDP, they are highly sensitive to interest rates and consumer demand. This makes the industrial production index an important tool for forecasting future GDP and economic activity.

Moving on to the design of the empirical research, it involve three stages. In the first step, correlation matrices are developed that show the biggest relationship between the surprise indicator and the price returns of the index. In this way, it is possible to decide at which minute, after the announcement of industrial production, the surprise indicator and the index price return correlate the most. To make the models as accurate as possible, correlation matrices are created in five scenarios:

a) Included all surprise values
b) When surprise value > 0
c) When surprise value >= 0
d) When surprise value < 0
e) When surprise value <= 0

The aim of this split is to obtain as much refined and filtered correlation information as possible, which will then allow more reliable regression models to be developed under the five contingency scenarios.

Further regression models are selected according to these criteria:

a) $R^2 >= 0$.
b) Industrial production p-value < 0,05.
c) Count of events > 20.

In the second step of this study, these regression models are tested to see whether they meet the assumptions of the regression analysis discussed above. The remaining models are analyzed. In the third step of the research, by applying the artificial intelligence method, we create new regression models based of the machine learning method, which are compared with the previously developed models.

4. Empirical research results

Following the methodology described above, the table 2 table presents regression models with ten different surprise values scenarios with the highest index price returns correlation between.

Table 2. Industrial production regressions models

Economic indicator	Regression model	R^2	R^2 in minute	P-value	Count of events	Scenario
Industrial Production (Y/Y)	Index return Chg % = -0.0069 + 0.0218 * surprise	6,00%	3	0,004	140	All
Industrial Production (Y/Y)	Index return Chg % = -0.0071 - 0.0238 * surprise	2,50%	13	0,063	140	All
Industrial Production (Y/Y)	Index return Chg % = -0.1040 + 0.1745 * surprise	24,70%	40	0,000	61	>0
Industrial Production (Y/Y)	Index return Chg % = -0.0949 + 0.1401 * surprise	13,90%	43	0,004	59	>0
Industrial Production (Y/Y)	Index return Chg % =-0.0876 + 0.1705 * surprise	21,80%	42	0,000	70	>=0
Industrial Production (Y/Y)	Index return Chg % =-0.0641 - 0.1159 * surprise	10,10%	43	0,008	69	>=0
Industrial Production (Y/Y)	Index return Chg % =0.0395 - 0.0658 * surprise	7,00%	20	0,026	70	<0
Industrial Production (Y/Y)	Index return Chg % = 0.0514 - 0.0454 * surprise	1,60%	31	0,288	71	<0
Industrial Production (Y/Y)	Index return Chg % = 0.0204 - 0.0531 * surprise	4,60%	20	0,059	79	<=0
Industrial Production (Y/Y)	Index return Chg % = 0.0363 - 0.0357 * surprise	1,10%	31	0,354	81	<=0

Source: created by the author

These regression models can be economically interpreted as follows: What change in the price return of the EURO STOXX 50 index can be expected at a given minute when economists have correctly or incorrectly predicted the actual values of the Industrial production indicator.

The value of R^2 indicates the percentage of the economic indicator surprise that explains the change in the return of EURO STOXX 50 in given minute. The table shows the minute at which the maximum R^2 value was recorded in 45 minutes. The P-value indicates whether the indicated regression model is statistically reliable. If the p-value estimate is less than 0.05, then the model is considered statistically reliable.

Only two models meet the research assumptions. This is R^2 > 20%, p-value less than 0.05, and number of events more than 20. In this case, in this scenario, this study will be continued only with these indicators.

In the next stage of the study, the remaining models is checked to see if they meet the assumptions of the regression analysis.

Table 3. Verification of the regression model assumptions on Industrial production (Y/Y) indicator in scenario >0

Assumptions of regression model	Results of assumption / method
1. Is the dependent variable normally distributed?	**Yes** Shapiro-Wolf p-value equal 0,63
2. Are the residual errors of different observations correlated (autocorrelation problem)?	**No** Durbin-Watson value equal 1,979
3. Is there no multicollinearity between the regressors?	**Not relevant in this paper**
4. Are there outliers to the data?	**No** All Cook values do not exceed 1
5. Is the data homoscedastic?	**Yes** Breusch-Pagan p-value equal 0,30

Source: created by the authors

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

As we can see from table 3 above the model meets all the assumptions required for the regression analysis, therefore it can be stated that the developed model is statistically reliable to predict the returns of the EURO STOXX 50 index.
The next model regression analysis assumption in another scenario is checked further.

Table 4. Verification of the regression model assumptions on Industrial production (Y/Y) indicator in scenario >=0

Assumptions of regression model	Results of assumption / method
1. Is the dependent variable normally distributed?	**Yes** Shapiro-Wolf p-value equal 0,64
2. Are the residual errors of different observations correlated (autocorrelation problem)?	**No** Durbin-Watson value equal 1,866
3. Is there no multicollinearity between the regressors?	**Not relevant in this paper**
4. Are there outliers to the data?	**No** All Cook values do not exceed 1
5. Is the data homoscedastic?	**Yes** Breusch-Pagan p-value equal 0,14

Source: created by the authors

As we can see from table 4 above the model meets all the assumptions required for the regression analysis, therefore it can be stated that the developed model is statistically reliable to predict the returns of the EURO STOXX 50 index.

Turning to the analysis of the Industrial production indicator and EURO STOXX 50 index, a figure 1 was created which contains information of EURO STOXX 50 price returns and Industrial production surprises values which are > 0
Figure 1. EURO STOXX 50 price returns analysis based on Industrial production surprises in scenario > 0

Source: created by the authors

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

Assessing the impact of this indicator on the price return of the index, both Figure 1 and Table 3 show that under the positive surprise values scenario, its impact on the price return on the EURO STOXX 50 index is positive (index price return increases). As we can see, the highest values of CMAR and R ^ 2 are seen between 31 and 40 minutes. It is difficult to justify economically why this is so, as it can be influenced by many factors. One of them is the behavior of market participants in connection with the fact that forecasts have been confirmed and decisions on purchase or sale transactions do not need to be made very quickly.

Best coefficient of determination for the regression model is 24.70%. From a statistical point of view, this is a relatively small value, which explains approximately one quarter of the return on the EURO STOXX 50 index at 40 minute. However, from an economic point of view and knowing that stock markets are multifaceted and affected by huge flows of information, events, moods, speeches, and so on. - this percentage is quite high and weighty. If a quarter of the return on an index can be explained by only one economic indicator, then by extending the research to include more indicators or factors, this percentage should increase.

Turning to the analysis of the second model, a figure 2 was created which contains information of EURO STOXX 50 price returns and Industrial production surprises values which are >= 0 .
Figure 2. EURO STOXX 50 price returns analysis based on Industrial production surprises in scenario >= 0

Source: created by the authors

Assessing the impact of this indicator on the price return of the index, both Figure 2 and Table 3 show that under the positive surprise values scenario, its impact on the price return on the EURO STOXX 50 index is positive (index price return increases). As we can see, the highest values of CMAR and R ^ 2 are seen last 15 minutes. It is difficult to justify economically why this is so, as it can be influenced by many factors. One of them is the behavior of market participants in connection with the fact that forecasts have been confirmed and decisions on purchase or sale transactions do not need to be made very quickly.

Best coefficient of determination for the regression model is 21.80%. From a statistical point of view, this is a relatively small value, which explains approximately the fifth of the return on the EURO STOXX 50 index at 42

1315

minute. However, from an economic point of view and knowing that stock markets are multifaceted and affected by huge flows of information, events, moods, speeches, and so on. - this percentage is quite high and weighty. If a quarter of the return on an index can be explained by only one economic indicator, then by extending the research to include more indicators or factors, this percentage should increase.

Last part of the empirical research - the comparison between the already shown models and the newly developed artificial regression models. This method is innovative and has not been performed often, therefore it is relevant to investigate which EURO STOXX 50 price return models can be obtained using this method.

Table 5. Comparison between ML and Basic regression analysis models

Economic indicator	Regression model	R^2	R^2 in minute	Count of events	Scenario
Industrial Production (Y/Y) basic model	Index return Chg % = -0.1040 + 0.1745 * surprise	24,70%	40	61	>0
Industrial Production (Y/Y) ML model	Index return Chg % = - 0.0819 + 0.1365 * surprise	33,22%	40	21	>0
Industrial Production (Y/Y) basic model	Index return Chg % =- 0.0876 + 0.1705 * surprise	21,80%	42	70	>=0
Industrial Production (Y/Y) ML model	Index return Chg % = - 0.0589 + 0.0968 * surprise	26,60%	42	25	>=0

Source: created by the authors

From table 5 can be seen that the values of the coefficients of the ML regression model differ from the base model. The effect on index returns remains the same - positive. In the ML model number of events is much smaller due to the data had to be broken down into training and testing sets. The coefficient of determination differs significantly between models. This indicates that even with smaller count of events, ML model can provide better explaining of EURO STOXX 50 price returns.

The results of this work confirm the theoretical assumption that better-than-expected news on industrial production has a positive effect on stock returns. Similar results were obtained by the researchers Gurgul and Wójtowicz (2014) and Harju and Hussain (2011), but the coefficients of determination cannot be compared because the researchers examined not one but several indicators.

Given how fast basic and maching learning is evolving, the regulatory framework should leave room to serve for further developments. Any changes should be limited to clearly identified problems for which feasible solutions exist. This kind of approach can be also found, for instance, in EU Commissions White Paper on Artificial Intelligence (COM 2020 (65) final, 19.2.2020), also in Executive order of USA President on "Maintaining American Leadership in Artificial Intelligence" (Issued 11.02.2019).

Conclusions

From the scientific literature analysis, we see that researchers get quite different stock return results with different economic indicators. In some cases, surprises in economic indicators have a positive effect on stock returns, while in others they have a negative effect. It has been observed that the results are quite contradictory regarding the industrial production indicator. Researchers agree that, in theory, better-than-expected news on this indicator should have a positive impact on stock returns, but the results are contradictory. Therefore, this indicator was chosen for this analysis. Simple regression analysis (OLS), GJR-GARCH, ARMA-GARCH, SV, GJD, ES, BVAR methods are used to model the impact of economic indicators on changes in stock price returns. The most

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES:@Entrepr69728810

common of these are the least squares regression analysis method and the ARIMA-GARCH methods. The ARMA-GARCH model is usually used to analyze continuous time series when the model equation also includes fluctuations the values of a variable for a previous period. For this reason, this method is not suitable for this case because past stock price returns are not examined in this work. Therefore, one of the research methods chosen in this study was the least square method (OLS). The second method that the authors have chosen and that is innovative is the machine learning method. The use of these two methods will allow to choose and understand which, the model is better on this problem

A methodology includes three stages of data analysis and modeling. In the first stage, correlation matrices are developed that show the biggest relationship between the surprise indicator and the index price returns. In this way, it is possible to decide at which minute, after the announcement of industrial production, the surprise indicator and the index price return correlate the most. To make the models as accurate as possible, correlation matrices are created in five scenarios. In the second stage of this study, the regression models are created and tested to see whether they meet all assumptions. The remaining models are analyzed. In the third stage of the research, by applying the artificial intelligence method, we create new regression models based of the machine learning method, which are compared with the previously developed models.

Total 10 regression models were constructed. Of those, 2 met all assumptions. Model statistics shows that the coefficient of determination is respectively equal to 24.70% and 21.80%. Trying to evaluate the value of the coefficient of determination from a statistical point of view, this is a relatively small value, which explains approximately one quarter of the return on the EURO STOXX 50 index in specific 40 and 42 minute. However, from an economic point of view knowing that stock markets are multifaceted and affected by huge flows of information, events, moods, speeches, and so on. - this percentage is quite high and weighty. If a quarter and fifth of the return on an index can be explained by only one economic indicator, then by extending the research to include more indicators or factors, this percentage should increase. Correlation matrix show that the higher values of the coefficient of determination are visible in the last five minutes. This indicates that the surprise values of the indicators have lagged but longer impact on stock price returns over all period. Thus, the opportunity to take a profit raise. In the end of the research machine learning method was applied to create new regression models on purpose to compare with base models. Results show that the values of the coefficients of the ML regression model differ from the base model. The effect on index price returns remains the same - positive. In the ML model number of events is much smaller due to the data had to be broken down into training and testing sets. The coefficient of determination differs significantly between models respectively 33,22% and 26,60%. This indicates that even with smaller count of events, ML model can provide better explaining of EURO STOXX 50 price returns. Stock regulation in both the US and Europe is an evolving process that depends not only on economic factors and technological development, but also on political will. The development of artificial intelligence will certainly have a positive impact on the stock institute not only in economic, but also in legal terms. The rules for financial institutions which systematically internalise have become more detailed and the pre-trade and post-trade transparency obligations have been extended to financial instruments other than listed shares in EU. In USA on the contrary, the rules on the financial institutions have been relaxed in recent years. European and the US markets depend on how legal regulation affects the trading process. Although they are both intend to promote competition in markets, EU and U.S. adopt different provisions with respect to main that strongly influence the competition for order flow among trading venues.

THE CONCEPT OF GLOBAL GOVERNANCE IN TOURISM FRANCHISES: A CASE STUDY OF TUI GROUP

Asad H. Aburumman

University of Sharjah, 27272 Sharjah, United Arab Emirates

E-mails: asadaburumman34@gmail.com

Abstract. The study characterizes the global corporate governance in the context of tourism. Risks the TUI Group would face during the implementation of the global governance strategy were assessed. The analysis of management and operational risks revealed that in conditions of global economic uncertainty tourism companies may use risk diversification to ensure flexibility. The risk likelihood assessment justified the need for the use of innovative management models with the aim of reducing the likelihood and impact of risks. An organizational-managerial framework for risk diversification was established that enables companies to cope with the global challenges in a synergistic effort. Finally, the study explored the socio-economic impact of global governance strategy on the competitive regional tourism

1. Introduction

Globalization has broadened the horizons of business markets, increased competition and technological advances. To achieve their presence on the global platform and stimulate international trade, organizations consistently make efforts to adopt global management tactics. It has become imperative for transnational organizations to be strategically effective by developing synergies between operations, capital and human resources (Bhullar, 2018).

In the aftermath of the 2008 financial crisis, discourses have emerged around variation in risk management, highlighting the interconnected role of business cycles, as well as derivative markets and geopolitical fragmentation (Han et al., 2019). Traditionally, the diversification process has been considered the most effective

way to reduce corporate risk (Sun et al., 2020). Implementation of a diversification strategy is a resource-intensive activity, therefore, determining the determinants of an effective strategy is necessary for global project managers to make more informed decisions in the management of companies (Shao et al., 2020).

The tourism services market transnationalizes in response to the current trends of the global tourism industry, giving room to international tourism complexes. National economies and social systems of different countries hence become interdependent and the international trade intensified. To regulate global problems in the tourism industry, international institutions were established that adapt relative standards and principles of international tourism.

The history of transnational tourism began in the mid 80-ies of 20th century with the internalization of the service industry (Skarga, 2018). A network marketing business model of interaction between tour operators and travel agents that was employed during that period allows acquiring a regular customer base and gaining control over the consumer market in remote destinations. Since the 90s, the network of tourist multinationals has been dynamically developing that are capable of effectively managing a set of tourism brands in the international tourism market as well as a tourism infrastructure (Dovgal, 2014). Under the auspices of tourism multinationals, an unrelated diversification strategy emerged (Duginets, 2017) that provides for the active cooperation with other industries such as food, retail, transport, media and information technology.

Transnationalization of the tourism market resulted in a tremendous growth in mergers and acquisitions (M&A) at the end of 90s (horizontal integration) (Dangi & Jamal, 2016). The consolidation of tourism entailed regional expansion and the emergence of conglomerate structures with related diversification (vertical integration). The restructuring of the global tourism industry took place with the penetration of new industries such as transport, banking, insurance, advertising, trade, and production. Furthermore, new destinations were introduced. In the context of globalization, European and British tour operators like TUI (Germany), Thomas Cook (Germany), My Travel (UK), Rewe Touristic (Germany), First Choice (UK), Kuoni (Switzerland), Grupo Iberostar (Spain), Club Med (France), Alltours (Germany), and Hotelplan (Switzerland) serve as an example of vertical and horizontal integration (Skarga, 2018). At the end of the 20th century, these companies acquired dominance in the European tourism market.

TUI Group is a German travel company, originated from the industrial and transportation organization. In the mid-nineties, the company turned its gears towards tourism and shipping, partly selling its industrial groups to acquire several large travel and transport companies. After the merger with a British subsidiary of TUI Travel in 2014, TUI Group became the world's largest travel business: many tour operators with leading positions in their own domestic markets are gathered under its roof. In Germany, they include TUI Deutschland, 1-2-FLY, airtours and Wolters Reisen; in the UK, Thomson and First Choice. TUI operators are also among the leading national brands in Austria, Poland, Switzerland, Denmark, Finland, Norway, Sweden, France, Belgium, the Netherlands, China, Russia and Ukraine. The TUI Group's Global governance Strategy drives on four specific strategic initiatives (Tui Group, 2019a).

Markets & Airlines: maintain strong market positions. In 2019, Markets & Airlines business experienced a number of external challenges such as potential Brexit and two 737 MAX crashes in Indonesia and Ethiopia. These events, the Boeing 737 MAX ban specifically, caused an 85% reduction of net profit in the third quarter of 2019. Therefore, the company's strategic goals were market consolidation in the Markets & Airlines sector and solution to structural problems. The company seeks to improve flexibility and cost position, facilitate innovation, and promote centralized IT processes. These initiatives will enable the expansion of product offering beyond

accommodation-only packages while remaining competitive, maintaining the leading market positions, and supporting the airline asset management system.

Hotels & Cruises: expansion at scale, driving returns by benefiting from vertical integration. With 411 hotels, TUI Group has built a large and highly profitable hotel business (with a return on invested capital of 14%). Hotels & Cruises business is closely linked to Markets & Airlines by virtue of benefits from vertical integration. According to the company's strategic plans, TUI will continue to invest in portfolio expansion and risk diversification through joint venture structures. It is planned to accelerate the growth of the TUI Blue brand to 100 hotels by the end of 2020 using a franchise partnership system. The key investment focus area are the Caribbean, South East Asia and Africa.

GDN-OTA platform: building a digital distribution platform based on competitive pricing to attract consumers. The new strategy relates to new markets: China, India and Brazil. The platform will focus on the asset-light business model. As the hotel and cruise portfolio grows, the TUI expands its digital capabilities. The company has ambitious plans for engaging hotels that previously had no collaborative relationships with it. TUI plans to surpass its competitors by offering attribute-based booking services and expanding the range of service offering to meet customer likings. Since the global hotel chains are accustomed to this technology, TUI may benefit from cooperating with the spa industry. The strategic goal of company's CRM system is to position TUI as a holistic digital hotel service provider by 2022.

Destination experiences platform: building scale in the 'things to do' market. The tours and activities market annually grows approx. 7% with a sales volume of around 150 billion euros. In this market, TUI has built a growing platform business with an impressive range of local tourism products. The TUI business model is based on a two-sided open platform that is accessible for direct booking, distribution colleagues and third parties (i.e., travel services suppliers), connecting company's destination experiences products.

With further growth of the information space, businesses need to improve their business practices and methods as well as to find effective ways of gaining competitive advantages. Organizational-managerial innovations based on online platforms and new forms of partnerships impel international tourism networks towards capacity strengthening.

This paper aims to examine the TUI Group strategy for global governance in the regional context. The following objectives were set to facilitate the achievement of this aim:
— Characterizing global governance within the context of corporate interactions.
— Exploring organizational and managerial risks of implementing TUI Group strategy for global governance.
— Assessing the likelihood of global and local risks the TUI Group may face with.
— Finding organizational and managerial solutions to reduce the likelihood of these risks materializing and eliminate their destructive impact.
— Building a blockchain-based organizational model of global governance in the tourism business.

Indentifying the socio-economic impact of the Global Governance Strategy on the competitive regional tourism.

2. Materials and methods

Exploring official statistics on the company's performance and development strategy as well as current trends of the global tourism industry, risks of implementing the TUI Group Strategy for Global governance were determined and a diversification solution was found. Methodology for the risk impact assessment consists of four steps: risk identification, risk description, risk assessment and organizational-managerial solution.

Risk identification: management identifies the risks relevant to the pursuit of the strategy within their business area in the context of four risk types, i.e., long-term strategic and emerging threats; medium-term challenges associated with business change; short-term risks due to changes in the external and regulatory environment; and short-term risks associated with internal operations and control.

Risk description: concerns in relation to risks are identified; causal factors that may result in the risk materializing and potential consequences if it does are determined. This allows evaluating the interaction of risks and potential triggers before developing mitigation strategies for causes or consequences.

Risk assessment: The main advantage of assessing the gross risk is that it highlights the potential risk exposure if mitigation fails completely or takes no place at all. Both impact and likelihood are ranked using the criteria given in Table 1.

Table 1. Risk assessment criteria

Impact Assessment				
Minor	**Moderate**	**Significant**	**Major**	**Serious**
Impact on:	*Impact on:*	*Impact on:*	*Impact on:*	*Impact on:*
- financials (sales and / or costs) - reputation; - technology reliability; - compliance; - health & safety standards; - tourism program delivery.	- financials (sales and / or costs) - reputation; - technology reliability; - compliance; - health & safety standards; - tourism program delivery.	- financials (sales and / or costs) - reputation; - technology reliability; - compliance; - health & safety standards; - tourism program delivery.	- financials (sales and / or costs) - reputation; - technology reliability; - compliance; - health & safety standards; - tourism program delivery.	- financials (sales and / or costs) - reputation; - technology reliability; - compliance; - health & safety standards; - tourism program delivery.

Likelihood Assessment				
Rare	**Unlikely**	**Possible**	**Likely**	**Almost Certain**
<10% Chance	10-<30% Chance	30-<60% Chance	60-<80% Chance	≥80% Chance

Source: Developed by the authors based on Tui Group (2019b).

The next step is to assess and document the mitigation to reduce the likelihood of the risk materializing and its impact on company's performance if it does.

Organizational-managerial solution: If the management assesses the current risk score too high, an action plan will be drawn up with the aim of introducing new or stronger measures to reduce the impact and/or likelihood of the risk.

Details on the likelihood and impact of the principal risks to the TUI Group as well as organizational-managerial solutions for their reduction are shown in Figure 1. In the risk assessment, the current risk position relates to the current level of risk faced by TUI and triggered by challenges in the global tourism industry. The target risk position shows the target level of risk after implementing an organizational-managerial mitigation solution. Table 2 showcases a risk management technology relevant to the corporate strategy of the TUI Group.
Figure 1. Management and organizational risks to TUI Group, adapted from Tui Group (2019a, 2019b, 2019c)

Table 2. Risk management under the global governance strategy, adapted from Tui Group (2019a, 2019b, 2019c)

Risk Identification	Risk Description	Impact	Likelihood	Organizational-managerial solution
MANAGEMENT RISKS				
1. IT Development & Strategy	Inability to provide strong technological solutions in the company's markets	Decline in competitiveness, quality and operational efficiency, impacting customer numbers, income and profitability	10-<30% (unlikely)	1. Developing and adapting (in conjunction with Executives, Business and IT teams) the Group's IT strategy which is clearly aligned to the overall business objectives. 2. Implementing the GDN-OTA platform, moving from retail to online to mobile in order to enhance customer experience and conversion. 3. Implementing a SAP-based central customer platform to collate all information on our customers across their journey to provide a single view of the customer alongside an eCRM platform which will support strategic marketing. 4. Placing increased focus on ensuring continuity plans for critical IT systems are in place and regularly tested. 5. Establishing clear technology standards and roadmaps which are linked to target audience and individual market objectives. 6. Adopting API, Big Data and Cloud architecture to improve speed, productivity and efficiency. 7. Using Blockchain to manage hotel bed allocation to be ahead of the competition.
2. Growth Strategy	Non-optimal asset utilization; Failure to achieve some of the initiatives required for overall growth	Decline in profits; Failure to achieve the overall growth targets and the loss of potential markets	30-<60% (possible)	1. Establishing a remuneration mechanism to create incentives for the sustained growth and robust financial performance. 2. Coordinating and monitoring the various growth initiatives. 3. Implementing initiatives to achieve growth with the focus on GDN-OTA sectors as well as adding scale through Destination Experiences with the new tours and activities platform which reduces the risk through diversification. 4. Adhering to investment criteria and authorization processes. 5. Maintaining strong relationships with the providers of aircraft finance. 6. Monitoring the overall market conditions in order to respond to extreme situations and invoke action plans.
3. Integration & Restructuring Opportunities	Challenges in integrating business and reducing the overlapping activities; Challenges in building a leaner and streamlined operating model	Financial and reputational damages	30-<60% (possible)	1. Establishing Markets and Domain Transformation Board to control over the standardization of processes across the markets. 2. Creating strong project management structures for all of the major restructuring, acquisition and disposal programs, designed to ensure the effective management. 3. Generating effective tools for project reporting in order to enhance transparency of project progress. 4. Regular reporting by the major projects to ensure quick resolution of any issues or to enhance coordination across the Group where required.
4. Corporate & Social Responsibility	Failure in upholding corporate and social responsibility standards from suppliers	Failure to achieve some of the initiatives required to sustainably manage tourism; Decline in company confidence;	<10% (rare)	1. Continuing to implement the 'Better Holidays, Better World' 2020 sustainability strategy framework which includes specific targets for key sustainability indicators. 2. Establishing a special sustainability department to collaborate with the business and other stakeholders to implement the sustainability strategy. 3. Operating one of the most carbon-efficient airlines in Europe with continued investment in new, more efficient aircraft (e. g. Boeing 787 Dreamliner & 737 Max) and cruise ships (e. g. the

		Reputational damage; Reduction of demand; and loss of competitive advantage		TUI Cruises and Hapag-Lloyd Cruises). 4. Implementing an environmental management system with airlines that achieved ISO 14001 certification. 5. Increasing measures to influence accommodation suppliers to achieve third party sustainability certification recognized by the Global Sustainable Tourism Council (GSTC). 6. Expanding Care Foundation to focus on the achievement of 2020 target for charitable donations and sustainability projects.
5. Information Security	Increased susceptibility to cyber-attacks and hacks; Inability to ensure an appropriate level of security control across the company	Negative impact on the relationship with the key stakeholders; Reputational damage; Potential for financial implications	30-<60% (possible)	1. Continued support of key initiatives to ensure all existing and future IT systems are secure by design, that exposure to vulnerability is managed effectively, user access is sufficiently controlled and colleagues are made aware of information security risks through appropriate training. 2. Promoting secure behaviors amongst our colleagues through the launch of a company-wide awareness campaign. 3. Continuous review and testing of all external devices and ongoing monitoring of logs in order to identify any potential threats as they arise. 4. Continuous improvement through the experience of real or simulated cyber incidents.
6. Impact of Brexit	Restricted access to European Union's airspace	Operational and financial damage	60-<80% (likely)	1. Establishing a Brexit Steering Committee to monitor developments as the political negotiations take place, assess any impacts on the Group's business model and coordinate suitable mitigation strategies. 2. Lobbying to protect consumer choice in liberalized and deregulated aviation markets.
7. Impact of COVID-19	Restricted international air traffic	Operational and financial damage	≥80% (almost certain)	3. Tracking and assessing COVID-19's impact as well as modeling various action scenarios to support customers, colleagues and stakeholders. 4. Adapting an action plan to reduce costs and mitigate the impact on company's profits.
	ORGANIZATIONAL RISKS			
A. Destination Disruptions	May impact one or more destinations	Damage from operational disruption and increased costs	≥80% (almost certain)	1. Defining crisis management procedures and emergency response plans with the focus being laid on the customer welfare. 2. Expanding destination portfolio with alternative experiences.
B. HR Management	Inability to attract and retain key talent, built leadership capability, and maintain trust of employees.	Challenges in managing and maintaining human resources under the corporate strategy; Decline in shareholder confidence; Inability to maintain a corporate business model	10-<30% (unlikely)	1. Enhancing performance and engagement through performance review, development plans, and career planning process. 2. Developing the International Leadership Program that attracts, develops, and retains high-quality employees. 3. Establishing and maintaining online professional academies to provide employees with learning offerings in specific fields. 4. Promoting strategically aligned leadership academy for high performing management at all levels.
C. Customer Demand	Sensitivity of customer spending power to external factors	Reduction of growth; Margin erosion	30-<60% (possible)	1. Building an integrated business model, whilst positioning the company as a globally operating tourism group (this enables a reduction of competitive threats). 2. Offering new experiences and tourism services to match customer demands and preferences. 3. Building strong and lasting relationships with the key hotel

				partners to develop new concepts. 4. Using scale to reduce costs and make prices competitive. 5. Market diversification in order to reduce the exposure to one particular economic cycle. 6. Promoting the benefits of travelling with a sustainable globally-operating tour operator to increase customer confidence.
D. Input Cost Volatility	Inability to adequately manage the volatility of exchange rates, fuel prices and other input costs; A rigid hedging policy; Change of macroeconomic conditions	Increased costs and margin erosion; Inability to respond to competitive pricing pressures during the season; Impact on exchange rates and the translation of market results into the reporting currency.	60-<80% (likely)	1. Using the appropriate derivative financial instruments to provide hedging of the underlying transactions with fuel and foreign currency. 2. Maintaining an appropriate hedging policy to ensure that the hedging cover is taken out ahead of the customer booking profiles. 3. Tracking the foreign exchange and fuel markets to ensure the appropriateness of the hedging policies.
E. Seasonal Cash Flow Profile	Inability to adequately manage cash balances in the winter low season	Inability to settle liabilities as they fall due whilst ensuring that financial covenants are maintained	30-<60% (possible)	1. Ensuring an even distribution of profit and cash profile across the year. 2. Producing short-term and long-term cash forecasts during the year to manage cash resources effectively. 3. Implementing a financial policy which leads to an improvement in the credit rating and makes it easier to maintain financing capabilities. 4. Maintaining high-quality relationships with the key financiers and monitoring compliance with the financial covenants. 5. Raising additional finance from the capital markets when required.
F. Legal & Regulatory Compliance	Non compliance with laws and regulations	Fines or other sanction from regulatory bodies	30-<60% (possible)	1. Communication and strong position of management regarding the compliance with laws and regulations. 2. Establishing Legal Compliance Committee to ensure appropriate oversight, monitoring and action plans and to further improve the compliance effort across the Group. 3. Embedding legal and tax expertise in all major businesses responsible for maintaining high quality relationships with the relevant regulators and authorities. 4. Ongoing implementation and review of Compliance Management System to monitor compliance with regulations and provide expert advice to local teams on specific compliance areas..
G. Health & Safety	The occurrence of accidents or incidents causing illness, injury or death to customers or colleague on a trip	Reputational damage and/or financial liabilities through legal action being taken by the affected parties	<10% (rare)	1. Establishing health and safety functions in all businesses in order to ensure an appropriate focus on health and safety processes as part of the operating activity. 2. Ongoing monitoring to ensure compliance with minimum standards. 3. Putting appropriate insurance policies to action.
H. Supplier Reliance	Failure in suppliers	Inability to continue the core operations	<10% (rare)	1. Using reputable and financially stable suppliers, particularly in areas where a single supplier is used to provide a service. 2. Regular monitoring of supplier performance against agreed terms and conditions.

				3. Building strong working relationships with all key suppliers.
				4. Attracting more owned and joint venture partner hotels that form a substantial part of the risk reduction program.
				5. Establishing a robust prepayment authorization process to both limit the level of prepayments made and ensure that they are only paid to trusted, credit-worthy counter-parties.
				6. Monitoring prepayments to effectively manage financial risks.
I. Joint Venture Partnerships	Failure of good relationships with key partners; Inconsistency of business objectives	Operational difficulties and jeopardized achievement of financial targets	<10% (rare)	1. Maintaining good working relations with the main joint venture partners as well as commitment to the growth strategy

3. Results

Current and potential risk management is critical to the long-term success of business and integral to corporate management. The process of risk identification, assessment and response is continuous and embedded within the company's operations. It is consolidated, reported and reviewed at varying levels of corporate management on a quarterly basis. This study divides the principal risks to the Group into management and operational sub-categories.

Management risks to TUI Group (Tui Group, 2019c):

1. IT Development & Strategy. The Group aims to improve customer experience by providing appealing and continuous customer service through delivery of digital solutions, innovative platform capabilities, underlying technical infrastructure and IT services required to support the overall strategy for steady corporate growth. An ineffective IT strategy may inhibit the ability of the Group to provide strong technological solutions in its markets. This will therefore affect company's competitiveness, quality and operational efficiency, ultimately affecting customer numbers, income and profitability.

2. Growth Strategy. The strategic positioning of the Group combines its own products with strong multi-channel sales and diversification across destinations. The Group focuses on improving its competitiveness, expanding the range of tourism products, and on developing digital platforms in new markets and destinations. The optimal asset utilization of aircraft, cruise ships and hotels is critical to the financial success of the Group, especially in a growth phase. There is a risk that the Group will not be able to achieve some initiatives and hence the overall growth.

3. Integration & Restructuring Opportunities. The key strategic paradigm of the Group is to act 'as one' wherever possible, particularly through group platforms and across the markets, while maintaining local differences, since the benefits of such differentiation are greater than those of harmonization. Currently, there are a number of restructuring projects being implemented under an active program of acquisitions (e.g., Hotelbeds) and business sales (e.g., Boomerang Reisen and Berge & Meer) with associated integration projects. With restructuring or integration programs, management risks arise that relate to further business integration and reduction of

duplicating factors. Apart from those, there may be challenges in developing an operating model that is more rational and optimized.

4. Corporate & Social Responsibility. For the Group, economic, environmental and social sustainability is a fundamental principle of management and a cornerstone of a strategy for continuously adding value to the company. Therefore, the Group creates the conditions for long-term economic success and takes responsibility for sustainable development in the tourism industry. The company's initiatives are to reduce the environmental footprint of tourism directly, through its own business, and indirectly, through the influence on partners in the supply chain, thereby yielding a positive impact on the quality of life in tourist destinations, their stable growth and development. There is a risk that the company will fail to achieve some initiatives and efficiently manage tourism if suppliers do not comply with its corporate and social responsibility standards. If the Group fails to maximize its positive impact on tourism destinations and minimize the negative impact to the extent that its stakeholders expect, this could result in a confidence decline, reputational damage, decrease in demand, and loss of competitive advantage. Furthermore, if the Group fails to achieve its sustainable development goals and put them in line with those in the UN Paris Climate Change Agreement (December 2015), this could lead to sustained long-term damage to its structure and strategic destinations.

5. Information Security. The Group is responsible for protecting the confidentiality, integrity, and availability of information provided to customers, employees, suppliers, and service delivery teams. This dynamic risk is associated with the increase of global cybercrime activities and new regulations (e.g., the European Union's General Data Protection Regulation). At the same time, consolidation under the TUI brand and growing dependence on online sales and customer care channels (web/mobile devices) increase corporate exposure to cyber attacks and hacks. If the Group does not provide an appropriate level of security control in the corporate system, this could have a negative impact on the interaction with key stakeholders, reputational damage and potential for undesirable financial consequences.

6. Impact of Brexit. The major challenge of the Group is to restrict the airline access to the EU airspace, particularly German and Spanish. This would affect the company's operational and financial activities. Furthermore, the scope of uncertainty includes the status of the UK partners and colleagues and new visa requirements for organizing trips from the UK to the EU.

7. Impact of COVID-19. Responding to the global challenges of COVID-19, the Group decided to suspend the vast majority of travel-related operations, including package tours, cruises and hotel operations. This temporary suspension aims to facilitate the global government efforts to mitigate the proliferation of COVID-19. The major concern of the Group is to limit flights, which could have a strong operational and financial impact.

Operational risks to TUI Group (Tui Group, 2019c):

A. Destination Disruptions. With operations in international markets, the Group is exposed to the risk of unwanted incidents within the tourist destinations, particularly natural disasters such as hurricanes or tsunamis; outbreaks of disease such as COVID-19; the political volatility as has been seen in Egypt, Turkey, and Greece in recent years; war in countries close to company's markets and travel destinations; and terrorist events such as the tragic incident in Tunisia in 2015. There is a risk that if such an undesirable event occurs in a tourist destination, affecting one or several destinations, the Group may potentially suffer from significant operational disruption and increased costs.

B. Human Resources Management. The Group's success depends on its ability to attract, retain and develop talents to deliver high-quality tourism services. There is a risk that the Group will be unable to attract and retain skilled employees, create potential for future leadership capability, and maintain the commitment and trust of its employees. Problems of managing and maintaining human resources under the corporate strategy may negatively impact shareholder confidence and company's ability to maintain a corporate business model.

C. Customer Demand. Travel and tourism expenses are discretionary, price sensitive, and competitive. The economic prospects remain uncertain with various markets at different points in the economic cycle. Furthermore, the recent years saw an emergence of successful alternative business models such as travel websites and hotel portals which allow end consumers to independently combine the individual elements of a trip and book them separately. There is a risk that these external factors will affect the spending power of customers, resulting in slower growth and lower margins.

D. Input Cost Volatility. A significant portion of operating expenses are displayed in local currency and relate to the price of aircraft and cruise fuel, which therefore exposes the business to fluctuations through the volatility of exchange rates and fuel prices. There is a risk that if the Group does not adequately manage the volatility of exchange rates, fuel prices and other input costs, this could result in increased costs and lower margins, affecting the ability to achieve certain goals. There is also the risk that if the hedging policy is too rigid, the Group may not be able to respond to competitive pricing pressures during the tourist season. Furthermore, changes in macroeconomic conditions may influence the exchange rates and the translation of market results into the reporting currency of the Group.

E. Seasonal Cash Flow Profile. Tourism is a seasonal business with the majority of profits earned in the summer months. There is a risk that if the Group does not adequately manage its cash balances in the winter season, this could affect liquidity and the ability to settle liabilities as they mature, while ensuring that financial conditions are met.

F. Legal & Regulatory Compliance. Most service providers operate across different countries and jurisdictions, which exposes them to a number of legal, tax and other regulatory laws that must be complied with. Operating across multiple source markets and in more than 115 destinations, the Group faces with a range of laws and regulations that must be complied with or else a risk of fines or other sanctions from regulatory bodies would emerge.

G. Health & Safety. For all service providers, ensuring the health and safety of customers is of paramount importance. This is especially true for the Group, as it is a globally operating tourism company, which annually sells leisure to more than 21 million customers. There is a risk of accidents or incidents that could result in illness, injury or death to customers or colleagues on a trip. This may result in reputational damage to the business and/or financial liabilities.

H. Supplier Reliance. Travel service providers are exposed to the risk of failure in their main suppliers, especially if the tourism services are integrated. This is aggravated by the industry convention on prepayments for hoteliers to ensure a secure distribution of rooms during the season as well as in areas where one supplier is used to provide a product or service. There is a risk that the Group will be unable to continue with its core business operations in the event of a major service failure from its key suppliers.

I. Joint Venture Partnerships. Travel and tourism groups normally use joint venture partnerships within their operations in order to reduce the risk of new ventures or to gain access to additional intellectual resources or innovations. The TUI Group consists of three large joint ventures: Riu, TUI Cruises and Sunwing. There is a risk that if the Group does not maintain effective relationships with its key partners or if their goals do not meet those of the Group, this could lead to operational difficulties and jeopardize the achievement of financial targets.

The results of risk assessment reveal that the Group may use risk diversification to ensure internal and external flexibility in conditions of global economic uncertainty. Technological solutions for global governance within the international tourism network are blockchain-based and enable synergy among the tourism market participants. Building interactions between participants in a regional ecosystem facilitates the innovative growth of the company in relation to its global and local dimensions. Recent studies show that synergistic effects of an innovation economy serve a unique hidden power, manifested only within open operations and in proactive cooperation. The efficiency of the regional innovation system is driven by many factors, from information security to transactional processes. The use of digital means helps reduce the human impact on the most communication processes, ensuring security and transparency of transactions. This is achievable through blockchain and smart contracts (Finogeev et al., 2018).

Blockchain technology has moved beyond the cryptocurrency and entrenched itself in various areas of international business (Hooper & Holtbrügge, 2020). It is predicted that by 2030, 30 percent of the global customer base will be constituted by entities using blockchain as a basic technology for conducting business activities [Gartner, 2017]. Going forward, the commercial use of blockchain will move from the experimental stage to presenting solutions to real problems, when large companies realize that it can be used to find solutions to current problems. This technology will provide many potential applications for cross-industry use that will impact contracts, transportation, payments and supply chain management (Floyd, 2018).

Blockchain is rapidly being adopted in financial institutions and banks, as well as in many other companies such as Samsung, Deloitte, RWE and IBM, with applications ranging from simplifying and automating trade finance to creating decentralized markets for electricity trading (Buterin, 2016). In addition, blockchain is used as a payment alternative to credit cards or PayPal for e-commerce and international transfers (Antonopoulos, 2017).

Blockchain is a kind of digital ledger or database that stores immutable records of all operations and transactions, all information about which is stored on the network (Drescher, 2017). Blockchain is a new type of database in which a distributed group of people can validate transactions and data in a way that does not require a centralized

third party and does not require them to trust each other. These data are stored in the blockchain and remain there publicly (Chirls, 2018).

Blockchain technology transforms traditional business activities by streamlining processes, increasing trust, and saving time and costs for companies (D. Tapscott & A. Tapscott, 2016). Automating processes and saving time with smart contracts make business more efficient and eliminate the need for bureaucratic procedures associated with organizing business processes (Torres de Oliveira, 2017). In addition, the risks associated with fraud and data security are reduced, since data no longer need to be transferred or managed by centralized organizations (Hooper & Holtbrügge, 2020).

The use of blockchain technologies affects the management of the international activities of companies on a global scale, changing traditional business processes and methods of cross-border transactions and allowing companies to operate in a decentralized mode (Hooper & Holtbrügge, 2020).

The blockchain technology has great potential to generate a fundamentally new mechanism for digital management. Research on blockchain applications in various fields revealed that the use of blockchain in international business is differential to global governance, enables the reduction of transaction costs and reliable protection of intellectual property rights (Hooper & Holtbrügge, 2020).

Blockchain technology provides significant benefits for the travel industry, as its implementation can help increase the competitive advantage of companies, increase customer satisfaction and productivity (Erceg et al., 2020). The use of blockchain technology in tourism can lead to lower costs associated with exchange rates and has great potential to simplify travel loyalty programs (Kowalewski et al., 2017).

Blockchain is multifaceted, and its application will improve tourism in several ways: (i) improve the travel experience by supporting the platform; (ii) cross-border payments through the blockchain are fast and reliable; (iii) the use of blockchain offers diversification, with which it protects the currency and strengthens the banking system; and (iv) blockchain can help reduce overall operating costs (Kwok & Koh, 2019).

In 2018, the TUI Group revealed a new revolution within its business development, embedding blockchain into its business model. The company tested blockchain by tracking internal operations with the aim of further expanding the scope of this technology to other processes. As per now, the company rolls out a pilot blockchain-powered project named BedSwap that allows recording hotel inventories (Kondratiuk, 2017).

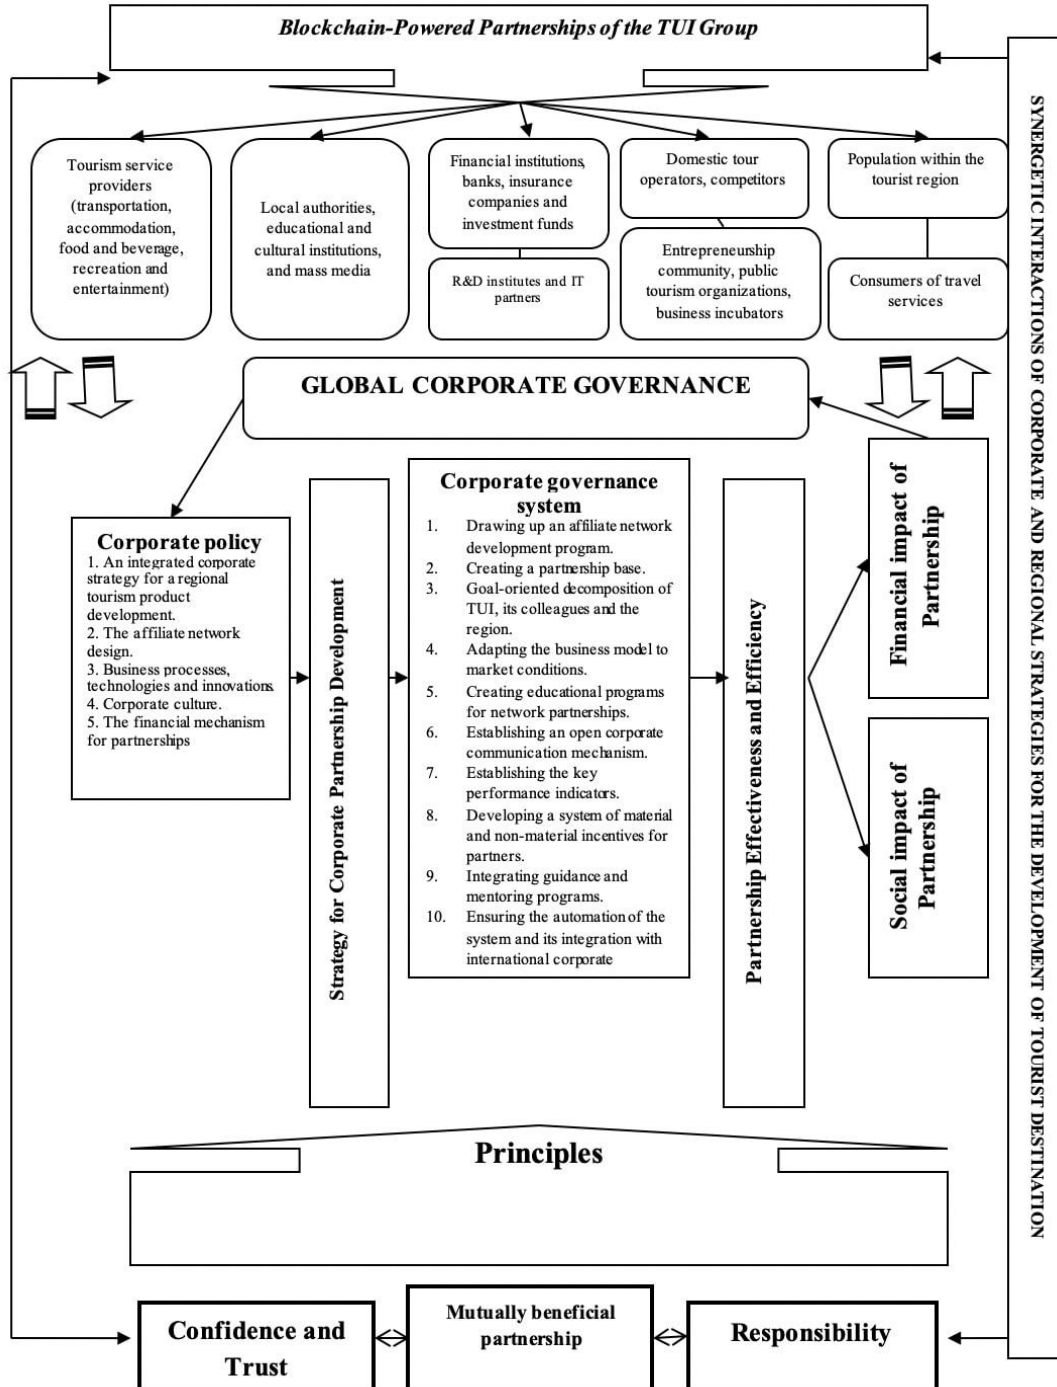
The integration of global governance model with the TUI Group's partnership system (Figure 2) would make it possible to innovate and diversify tourism offerings through a cultural dimension of corporate management. The integration may generate a universal form of partnership based on corporate values and synergies as well as organizational and technological elements that are clearly defined.


Figure 2. The TUI Group's Blockchain-Based Model of global governance.

As the information space and the loyalty systems of transport operators and hoteliers grow, tourism services became available to a broader range of consumers, entailing a mass refusal from the comprehensive travel services. A modern-day tourist adheres to democracy, independence and individualism in his journey-related decisions, which traditional service providers fail to ensure. In this regard, the tourism industry is undergoing significant changes of consumer demand towards new and creative. Thereby, the expansion into new markets and tourist destinations would provoke sustainability in transformation processes (Edgell, 2016). Meanwhile, various tour developers seek to portray the socio-cultural identity of tourist destinations.

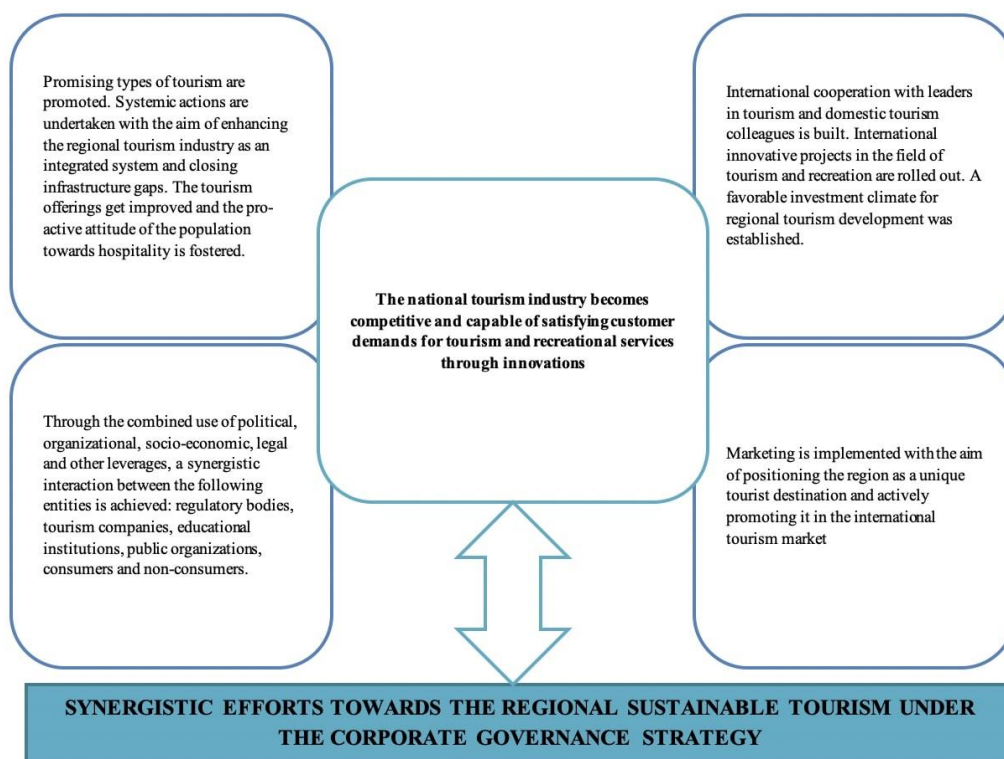
The integration of global governance strategy into the corporate policy of the Group permits the sustainable tourism development, whilst shaping the international eco-friendly business model. The regional socio-economic effects of this strategy are shown in Figure 3.


Figure 3. The socio-economic impact of employing the global governance strategy on the generation of competitive tourism products,
Source: developed by the authors

With globalization, the instability in business and project management has increased. Many internal and external factors influence the successful implementation of global projects of multinational companies. Organizational culture, socio-economic factors, inter-ethnic culture and senior management attitudes affect the work of a global project team (Bhullar, 2018). In international business, attention is mainly focused on the direct impact of international diversification on the profit or risk of firms, and little attention is paid to the impact of locations where internationalization activities have taken place (Harjito et al., 2018).

The success of the TUI Group largely depends on the success of global projects. Cross-border cultural diversification has a significant impact on the company's operations. In this regard, the company's interaction with regional representatives of the tourism market and the interweaving of development strategies allow improving the quality of the tourism product and providing the TUI Group with a competitive advantage in the global business scenario.

4. Discussion

The global instability and uncertainty necessitate a fundamentally new approach towards thinking and international interaction to manage public relations more efficiently, whilst reducing environmental footprint. Issues such as globalization and social policy management have been opened up for discussions in the last decade. The latter was regarded from the perspective of multicentricity where the concept of global governance went beyond intergovernmental institutions, was socially oriented and globally inclusive (Unlu, 2017). Meta-economic approaches to management in the context of globalization were determined with a focus laid on those frameworks for global governance that were aimed at sustainability, competitiveness, and innovation-driven economic growth (Buracas, 2018).

The concept of global governance was previously disclosed by the members of the Club of Rome with the aim of solving the global problems of social development and socio-economic relationship building. In 1968, the Club of Rome established a global forecasting, modeling and programming system. At the end of 2017, the Club members published a sensational report entitled 'Come on! Capitalism, Short-termism, Population and Destruction of the Planet.' This report proclaims that the Old World is doomed and a New World is inevitable (von Weizsacker & Wijkman, 2017). The new concept of global development calls for the rejection of materialism, financial speculation and capitalism. The report emphasizes the need for a philosophical approach towards the current world crisis. The authors refer to the initiative of the Pope and the UN approach articulated in the 2030 Agenda for Sustainable Development (United Nations, 2015).

Joining international tourism alliances and networks can enhance the innovative potential of tourism agencies through the expansion into new markets and the adoption of new technologies and value chains. However, the benefits from cooperation are intertwined with regulatory compliance that is crucial to competitiveness in the global tourism market. Studies revealed a negative impact of transnational tourism management, concluding a need for counteracting the negative influences of globalization (Mishulina, 2016). It is a justified recommendation to improve the mechanism for minimizing the negative environmental impact and associated socio-economic effects from large investment projects in the field of tourism and recreation (Molchanova, 2018).

The collaboration with single economies and global industries is a key to the acquisition of competitive advantages in the international arena. Global governance refers to the meaningful, process-oriented and polycentric actions and interactions between global actors having direct or indirect influence on international relations through the use of economic instruments, methods and mechanisms (Barry, 2001). Moreover, global governance goes beyond the boundaries of the national state and covers a network of diverse business-public interactions (General Assembly of the United Nations, 2010).

Conclusions

The rapid pace of transnationalization caused the international economic relations to transform. As a result, a range of new approaches to corporate governance in the global tourism sector have emerged that are based on the interdependence of national economies. The analysis of management and operational risks in the TUI Group strategy for global governance revealed that the Group may use risk diversification to ensure internal and external flexibility in conditions of global economic uncertainty. The risk likelihood assessment showed the need for the adoption of innovative management models to reduce the likelihood and impact of risks. The use of digital solutions will reduce the human impact on most communication processes, ensuring the security and transparency of transactions between economic agents.

The integration of blockchain-based global governance into the partnership system of the Group will make it possible to innovate and diversify tourism offerings through a cultural dimension of corporate management. The integration may generate a universal form of partnership based on corporate values and synergies as well as organizational and technological elements that are clearly defined. The expansion into new markets and tourist destinations was found to precondition sustainability within the Group's transformation processes. The analysis of socio-economic benefits from implementing the TUI Group's strategy for global governance to expand destination experience confirms the contribution to sustainable and eco-friendly international tourism.

OPEN INNOVATION MODEL IN THE KNOWLEDGE INTENSIVE BUSINESS SERVICES IN THE SLOVAK REPUBLIC[*]

Dana Benešová [1], Viera Kubičková [2], Miroslava Prváková [3]

[1,2,3] *University of Economics in Bratislava, Faculty of Commerce, Department of Services and Tourism, Dolnozemská cesta 1, Bratislava, Slovak Republic*

E-mails:[1] dana.benesova@euba.sk; [2] viera.kubickova@euba.sk; [3] miroslava.prvakova@euba.sk

Abstract. Innovation and its management has been a current challenge for companies in the knowledge economy. Open innovation is a system that creates and uses synergies from sharing and collaboration. The digital economy and society support the emergence and functioning of open innovation systems. In the Slovak Republic´s environment, the management of innovations through an open mechanism is a perspective for the development of knowledge intensive business services (KIBS). These services are an important link in the value chain of the Slovak economy focused primarily on the automotive industry. The article deals with the creation of a model of open innovation in the environment of KIBS production in the Slovak Republic. Its elements and their classification are based on the results of the primary survey carried out by the Delphi method. The importance of individual elements thus reflects the priorities of innovation management of KIBS companies in the Slovak Republic. In the current theory, we do not find a model with these specifications. The presented model thus represents an original result supported by the primary research in a specific environment. The construction of the model identifies three building components of the open innovation mechanism: preparation and planning, implementation, evaluation of outputs and a value creation. They are complemented by factors, risks and effects. The model provides the possibility of measurement at the level of inputs and outputs.

Keywords: open innovation; model; knowledge intensive businees services; the Slovak Republic

1.   Introduction

Innovations and its management have been a current issue for theory and practice. The reason is the effects of innovations, which, in the characteristics of the current economy, are a source of competitiveness of companies and national economies. The challenge for innovation management is therefore to set up a system that would support innovations, optimize the costs of their development and application, and generate synergistic effects. The Open Innovation Mechanism is a platform that accepts this challenge. At the same time, it reflects the conditions of the digital economy, within which the transfer of knowledge is accelerated and enables its sharing and cooperation of the subjects. According to Baur (2017), open innovation (OI) is nothing new, but it is currently gaining more acceptance and importance precisely because of digitalization. According to Trott and Hartmann (2009), the benefits and drivers of increased openness have been noted and discussed as early as the 1960s, especially in terms of mutual research and development (R&D) cooperation. The use of the term OI in relation to the growing trend of external cooperation was supported in particular by Chesbrough (2003), who expressed a modern view of open innovation and thus became the founder of this term. Several authors have been working on open innovation in the geographical territory of the V4 countries. Šmíd (2008) defines open innovation as a tool for sustainable business development. The authors Hvizdová and Máchal (2017), Knošková (2015), Vilčeková et al (2018) deal with the factors of knowledge transfer and cooperation of subjects in the mechanism of open innovation.

The topic of innovations in services and their management has a time lag in research compared to the same topic addressed in the conditions of production. This is also consistent with the thematic area of open innovation. According to Kubičková and Benešová (2011), the increased pressure on the performance of service producers is caused by increasing competition and growing trade in services. The need for service companies to make more efficient use of external ideas and technologies in their innovation activities is becoming increasingly desirable. The approach to open innovation according to Galati et al. (2012) may not be the same for all types of companies and in every industry. Each company is unique, with its own internal organization and specific internal dynamics and processes to which open innovation processes need to be adapted. This idea supports the effort to define open innovation and its mechanisms in the service production environment. The services sector is specific for its heterogeneity of activities. The production of services is affected by the specific characteristics of the services. It is therefore logical to accept differences in approaches to innovations and their management in services in terms of openness.

The article deals with the creation of a model of open innovation in the environment of knowledge-intensive production of services. The study presents a model of open innovation, which is constructed on the basis of the identification of factors, effects and risks of open innovation presented by several authors and models. Subsequently, it is adapted to the conditions of KIBS production in the Slovak Republic based on the application of the Delphi method. The method was applied by asking experts from the environment of innovation management in knowledge-intensive business services (KIBS) in the Slovak Republic. In current theory, we have not found a model with these specifications. The presented model thus represents an original result supported by the primary research in a specific environment.

1. Literature review

According to Metcalfe and Miles (2017), in the age of digitalization, companies that have an active approach to knowledge acquisition and can use it effectively will be among the first to provide better, faster and cheaper solutions than their competitors. The period of the Fourth Industrial Revolution is characterized by complete automation and digitalization processes with the use of electronics and information technologies in both production and services. According to Roblek et al. (2016), companies that want to move forward and be successful in the current competitive struggle must adapt their innovation processes to the conditions of the Fourth Industrial Revolution.

Currently, collaboration is not just about sharing knowledge about technology, it is also about sharing knowledge of the market, customers, or companies´own business models. Open innovation can be a response to changing market conditions and more specific customer needs. Chesbrough (2003) defines OI as the acquisition and provision of knowledge to accelerate internal innovations while expanding markets for the external use of internal innovations. Conceptually, it is a more distributed, more cooperative and decentralized approach to innovations, based on the fact that today's useful knowledge is widely distributed and society does not make full use of its resources if it innovates itself. The author also presents the effects for which it is advantageous to involve OI processes: achieving sustainable profitability, stable growth, personalization of services, focus on new business models, growing agility of companies and profit from the aspects of the Fourth Industrial Revolution. Through the OI mechanism, a company can reduce costs, speed up time for product and services launches, increase market differentiation and create new revenue streams. In terms of OI effects, we can consider effects in the areas of: consumer and customer, employee, business performance, product, partners and technology.

According to the author Durmaz (2013), OI is about creating a system in which ideas from customers, employees and other interested parties are openly projected. This system makes it possible to collect and develop ideas in cooperation with other actors, leading to continuous innovations. The term OI defines Kirschbaum (2005) as a cooperation between companies, individuals and public agencies to create innovative products and services. This process is also about sharing your risks and rewards. The definition is based on the belief that in a world of distributed knowledge, companies can no longer rely solely on in-house research, but rather on the benefits of innovations in cooperation with partners. Open access to innovations has brought significant benefits in many areas, including healthcare, IT, business services and public policy.

From the point of view of the effort to incorporate open innovation into the type of innovation based on the definition of several authors, we can state that this is a mechanism for creating innovation, not a type of innovation. An OI mechanism can result in innovation of a different type or kind.

Zapfl (2018)	Utilization of the innovative potential of the environment	Investments in R&D Creativity Cooperation

Source: author´s own, 2020

The above systematization of definitions of open innovation (Table 1) points to the application of different approaches and different understandings of this phenomenon. Chesbrough (2003) discusses knowledge flows, Tidd (2014), Dahlander and Gann (2010) identify open innovation as resources, which is a broader area. Others (Lazzarooti and Manzini, 2009) do not mention knowledge exchange in their definition, but instead they define it as a cooperation in which there are several partners doing something together. Cooperation is a common feature of explaining open innovation. The logical consequence of the cooperation is a grouping of partners, while the authors identify this group differently (Hossain, Anees-ur-Rehman, 2016; Wallin, Krogh, 2010; Greco et al., 2016; Tidd, 2014; Bengtsson et al., 2015; Chesbrough, 2003). The common element is the fact that the actors come from four areas: a company, individuals, private entities, public institutions. These are various departments in a company, employees, customers, clients, specialists, buyers, competitors, suppliers, universities, schools, research institutions, state and regional governing institutions, government, local communities, network and cluster partnerships, etc.

We understand open innovation as a process of sharing knowledge and other resources beyond the boundaries of the company/corporation as part of an open business model with a number of different actors with which the company/corporation cooperates. Open innovation is a mechanism enabling the use of synergistic effects from the sharing of innovation capacities of the participating actors, thus increasing the innovation potential of a company. Opening up the innovation process to partners has become a widely accepted path of innovations. In parallel with the growing research on open innovation, differences in the interpretation of the OI models have also developed. The basic point of differentiation is linked to the word "open," by which different scientists denote different degrees or dimensions of openness (Tynnhammar, 2017). According to Lazzarotti and Manzini (2009), the basic view of the application of OI in a company, which can be quantified, is an extent of openness to innovation. The extent of openness is a significant factor in the resulting effects of the mechanism of open innovation. According to the author Tynnhammar (2017) and his model, the extent is defined by the number of partners, the type of cooperation and cooperation in different parts of the process. More complex models focus on integrating and using ideas created outside and within a corporation in order to innovate. The defining feature of open innovation in this sense is the open business model.

The starting point for creating a model of open innovation in the environment of knowledge-intensive services in the Slovak Republic is the familiarity with the existing models and the determination of key elements for its construction with an emphasis on its functionality in a specific environment. A relatively extensive study of existing more or less complex efforts to model open innovation leads us to accept the following models of open innovation: the OI model focused on value creation (Aranha et al., 2015), the organizational model of OI (Salampasis, 2015), the model based on open innovation life cycle framework (Krause, Schutte, 2016), a model of the OI impact on a company's outputs (Farha, 2016). The models are not mutually exclusive, each author focuses on other aspects of an open innovation, as the purpose and focus of the model were partially different. The models differ mainly in the complexity of their application in practice, while the latter model integrates several already existing separate models into a common theoretical framework. An important finding is that the models have a built-in methodology for measuring open innovation and partly express the measurability of its effects. The question is the functionality of the models in terms of measurability of OI impacts, as they are, according to the several authors, too broad to be able to express them rigorously and quantitatively. The authors of the models express the possibility of measuring the effects of this mechanism only through the impacts on the overall performance of a company through key performance indicators.

The model focused on value creation and the one based on open innovation life cycle framework can be considered process-oriented, the other two as relationship-oriented. The models assume a partial ability to quantify and measure them, except for the conditions of the organizational model. Comparative analysis of the open innovation models is in table 2.

Table 2 Comparative analysis of the open innovation models

Title	Author	Characteristics	Measurability
The OI model focused on value creation	Aranha et al. (2015)	The functionality of open innovation is provided by an open business model that uses internal and external sources of knowledge and partnerships (independent variables) to create value (dependent variable). The process model.	✔
The organizational model of OI	Salampasis (2015)	Connectivity of three blocks: individual level, human resources management and organizational skills. An agile work environment is essential for the implementation of OI processes, which enables resiliency and flexibility of processes and also supports cooperation. The relational model.	**X**
The model based on OI life cycle framework	Krause and Schutte (2016)	The model consists of 18 factors and directs companies to implementation, performing and improving open innovations. The model consists of blocks: OI planning and preparation, OI application, OI measurement and evaluation, and OI enhancements. The process model.	✔
The model of OI impact on a company's outputs	Farha (2016)	The model measures the relationship between individual indicators and their impact on outputs in the form of inclination to innovation and company´s performance. It is based on 8 building blocks of open innovation: erosion factors, processes of open innovation, knowledge management, partnerships, organizational management, intellectual property, risks and benefits. These eight blocks are grouped into five indicators, which form a model of open innovation. The relational model.	✔

2. Methods

The aim of the article is to create a model of open innovation applicable in the environment of KIBS production in the Slovak Republic. The construction of the model was created on the basis of the acceptance of relevant model approaches and subsequently on the basis of the confrontation of the induced elements of the model with the professional environment. Using the chosen methodological procedure while constructing the model we answer the following research questions (RQ):

RQ1: What is the position of KIBS in the Slovak economy?

RQ2: Which factors of open innovation are the key ones in the conditions of KIBS in the Slovak Republic?

RQ3: Which risks are the most significant for the process of organizational innovation in KIBS in the Slovak Republic?

RQ4: What effects are created by the implementation of open innovation in KIBS in the Slovak Republic?

The starting information for the creation of the model is the position of KIBS in the Slovak economy as a relevant environment. Data from the Statistical Office of the Slovak Republic and Eurostat were used to identify the position of KIBS in the Slovak Republic. The selected indicators are gross domestic product, employment and labor productivity.

The construction of the model itself is based on the source analysis, existing OI models and the results of the Delphi method. By analyzing the relevant sources, we identified 81 key elements of OI. The key elements included the items: factor, risk, effect. After analysis of OI models, 125 key elements were identified. After combining the two above mentioned sources, a knowledge base with 206 key elements was created. This number represented a comprehensive range of identified factors, risks and effects, with the scale including term overlaps and content relatedness of the defined elements. Subsequently, we proceeded to narrow the scale on the principle

of term and content relatedness of concepts. The reduced database contained 52 key elements, which were divided into 3 logical units - building blocks of the OI model: the preparation and planning, the implementation, the evaluation of outputs and the value creation. Within the first block (planning and preparation for OI), based on the analysis of the sources, 4 main factors had been identified, which were further defined by means of subfactors. In the second block of OI (implementation of OI), the analysis of the sources had identified the process of open innovation, which can be applied in 3 ways, and then the main risks arising from these processes were identified. The third building block of OI (evaluation of outputs and value creation) was characterized by the effects resulting from the application of the OI mechanism for the company.

Through the application of the Delphi method, the degree of influence of factors, risks and effects on the application of the proposed conceptual model in the KIBS environment in the Slovak Republic was identified. The Delphi method was chosen for this qualitative survey by inquiring the experts. The conditions for the selection of the experts and the areas of their expertise were very specific, which significantly narrowed the circle of potential experts in Slovakia. 16 experts were contacted and 12 of them answered. The addressed experts (Table 4) worked for more than 3 years in an open innovation environment in KIBS.

The qualitative survey was conducted in the period of 7 - 20 January, 2020 in the form of an online questionnaire, created through Google forms. The questionnaire consisted of 19 questions, of which 3 were identification ones, 7 were open questions and 9 were closed. The closed questions consisted of the evaluation of the degree of influence of the selected factors, risks and effects in the form of the Likert scale (5 - the highest level of importance, 1 - the lowest level of importance) on the application of OI in KIBS in the Slovak Republic. Each evaluation was followed by an open question with the opportunity to express their views. Data processing was performed by calculating the average and median for the individual OI indicators. The average was used to determine the order of the factors, risks and effects. As stated by Egerová and Mužík (2010), if the average is equal to or lower than 3, then the given indicator is not important. If the average is higher than 3, the indicator is very important, and if its value is higher than 4, the indicator is the key one. The average was rounded to two decimal places. To identify the order of the subfactors, risks and effects, a scale of importance was assigned with the assigned significance (Table 3). The median was further used as an indicator of group opinion (Egerová and Mužík, 2010). After the evaluation, the resulting order as well as the median values were resent to the experts for verification and possible modification of the original answers. This verification took place in the period of 10 - 24 February, 2020 in the form of an online questionnaire created via Google forms. After obtaining feedback, the comments were incorporated and subsequently a draft conceptual model of the application of open innovation in the KIBS environment in the Slovak Republic was created, whose subfactors, risks and effects had a median value greater than or equal to 4 after the evaluation.

Table 3. Scale of the degree of influence of the factors (together with the sub-factors), risks and effects on the application of OI in KIBS

Scale of the degree of influence	Significance
1 – 2,4 (including)	insignificant
2,5 – 3,5(including)	less significant
3,6 – 4,4 (including)	significant
4,5 – 5 (including)	the key one

3. Results and discussion

RQ 1: What is the position of KIBS in the Slovak economy?
In the conditions of knowledge-based economy, the production of knowledge intensive services is a characteristic feature of advanced economies. KIBS are gaining a unique position, satisfying intermediate demand and thus directly influencing the promotion of innovation throughout the whole economy. One of the first definitions of the term KIBS is linked to Davis and Botkin, 1994. Their definition consisted of a common characteristic of companies with high level use of knowledge. In the economic activities, KIBS are represented by sections J - information and communication services, M - professional, scientific and technical activities (excluding division M 75) and divisions N 78 - job placement, N 80 - security and investigation services. According to Nählinder (2005), KIBS are services and business operations that are highly dependent on expertise. As a result, their employment structures are shaped for the benefit of scientists, engineers and other professionals. Their

importance in the Slovak economy is supported by a strong customer base of the automotive, electrical and engineering industries, whose competitiveness is also conditioned by quality service deliveries.

In 2018, KIBS accounted for 13.3% of total GDP in the Slovak Republic, and information and communication services accounted for 4.2% of GDP. They accounted for 13.4% of total employment and information and communication services for 2.9% (Statistical Office of the Slovak Republic, 2020). According to the statistical availability, GDP and employment in KIBS include the performances of sections J, M and N. In the period of 2008-2017, the volume of GDP in the Slovak Republic, created in sections J and M together, increased, while in 2007 it amounted to 5211.5 mil. EUR and in 2017 7933.0 mil. EUR. The decrease in this indicator was recorded only in 2013. This volume was the lowest among the V4 countries, but the growth rate was higher in the Slovak Republic than in Czechia and Hungary. The average annual GDP growth rate in KIBS in the Slovak Republic was 4.8% in the period under review (European Commission, 2020). The dynamics of the development of KIBS in the Slovak Republic suggests their relatively significant impact on the Slovak economy. At the same time, their influence is also strengthened by the ability of KIBS products to transform innovations into buyer entities and to improve value chains in the Slovak economy.
Fig. 1. Labour productivity in KIBS (thousands of EUR)

Source: author´s own based on the Eurostat database

A comparison of the achieved labor productivity in KIBS (expressed as sales per employee) and its development in the years of 2008 - 2017 in the selected countries suggests that KIBS productivity in the Slovak Republic increased and it is the highest in the V4 countries at the end of the period under review, reaching the labor productivity level achieved in Spain (Fig. 1). Support for increasing performance in KIBS in the Slovak Republic is a challenge for the area of innovations and their management. Therefore, we chose the KIBS production environment as a relevant environment for creating an open innovation.

RQ 2: Which factors of open innovation are the key ones in the conditions of KIBS in the Slovak Republic?

Based on the analysis of the sources on the subject, we defined four key factors - company culture, organizational structure, business model and organizational readiness, as those influencing the implementation and the process of open innovation (OI) in companies mostly.

We relied on the several authors (Chesbrough 2003; Tuomi 2009; Wallin and Krogh 2010; Galati et al. 2012; Zobel et al. 2016; Hvizdová and Máchal 2017; Zapfl 2018), who identified company culture as an important factor creating a satisfactory or unsatisfactory background for the application of OI. However, when implementing open innovation processes, it is important that the company culture, when communicated by it externally, reflects the real situation within the organization. By testing through the subfactors creating the company culture of the KIBS companies in the Slovak Republic (Table 5), we found that the key subfactors with the highest impact on the use of open innovation are: motivation, cooperation, freedom of expression, leadership style, dialogues and employee training within the organization. Very important subfactors are also respect for diversity, acquisition and retention of talents, mutual internal dynamics, creativity, organizational support and trust.

Table 5 The influence of the key factors of open innovation in the KIBS conditions in the Slovak Republic

Evaluation of the influence of the company culture factor on open innovation through the subfactors							
Subfactor	Motivation	Cooperation	Freedom of expression	Leadership style	Dialogues	Education	Respect for diversity	Acquisition and retention of talents
Mean	5	4,75	4,75	4,5	4,25	4,25	4	4
Median	5	5	5	4,5	4,5	4,5	4	4
Subfactor	Internal dynamics	Collectivity	Creativity	Organisational support	Trust	Fair play	Development	Intellectual potential
Mean	3,75	3,5	3,75	3,75	3,75	3,25	3,25	3
Median	4	3,5	4	4	4	3	3	3
Evaluation of the impact of the organizational structure factor on open innovation through the subfactors							
Subfactor	Top management	Human resources management	Research and development	Knowledge management	Intellectual property management	Sales department	Marketing department	Financial department
Mean	5	4,5	3,75	3	2,5	2,25	2	1,75
Median	5	4,5	4	3	2,5	2	2	2
Evaluation of the impact of the business model factor on open innovation through the subfactors							
Subfactor	Open innovation environment of the company	Intensive cooperation in the company	Mixed financial resources	Interactions in the ecosystem	Open process of innovation development	Creating an open innovation community	Creating an open innovation ecosystem	Large number and diversity of partners
Mean	4,25	4,25	4,25	4	4	3,5	3,5	3
Median	4,5	4,5	4,5	4	4	3	3	3
Evaluation of the impact of the factor of organizational readiness of the company on open innovation through the subfactors							
Subfactor	Strategic orientation	Qualified workforce	Open innovation processes	Findings on open innovation	Internet and online environment			
Mean	4,75	4,5	4,25	3,75	3,25			
Median	5	4,5	4,5	4	3			

Source: authors' own processing of survey results, 2020

The open innovation factor "organizational structure" is the way in which a company communicates, shares responsibilities and adapts to change. According to several authors (Kearney, 2008; Schweisfurth et al. 2011; Piller, 2012; Durmaz, 2013; Hvizdová and Máchal, 2017), the division of powers and responsibilities within a company has an impact on the overall application of open innovation processes and thus on the company's relationship with the external environment. . The key subfactors reflecting the „organizational structure" factor in KIBS companies in the Slovak Republic are top management and human resources, which the company has at its disposal and manages. The top management of the company makes decisions of a strategic nature that affect the degree of implementation of OI, human resource management plays an important role in managing the optimal exchange of knowledge from employees to the management of the company and vice versa. A very important subfactor is also research and development carried out within the company as well as in cooperation with external partners.

Based on many authors (Chesbrough, 2003; Durmaz, 2013; Brant and Lohse, 2014; Knošková 2015; Dabic et al., 2016; Greco et al., 2016; Osorio et al., 2016; Zapfl 2018 and others) an important factor of OI is the business model focused on openness in the application of innovation processes.

Openness within the business model means in particular the ability of the company to open up when exchanging knowledge and other resources (human, financial, material and others). Openness also applies to a large extent to cooperation, which must be effective both within the company and beyond its borders, implemented interactively in the innovation ecosystem. Millard (2018) defines an innovation ecosystem as a complex of communities, organisms and its subsistence environment functioning as an ecological unit. The innovation ecosystem consists of actors such as universities, governments, corporations, businesses, private investors, foundations and others. Each of them plays an important role in creating the value chain of the ecosystem by turning new ideas into reality through cooperation, the provision of open accesses or financial investments. The results of the survey show that the key subfactors of the business model in KIBS companies in the Slovak Republic are an open innovative business environment, intensive cooperation in the company and interactions in the ecosystem. Very important sub-factors include the use of mixed financial resources and the open process of innovation development.

According to numerous authors, a significant factor in the application of OI is the organizational readiness of the company. Open innovation is not a one-off tool, given that the effects of the application of OI have a long-term effect, it is therefore heterogeneous in time and a strategic tool. Open innovation is based on the high qualification of human resources, but also on human abilities to cooperate, accept external sources of knowledge, or offer their knowledge for external use. The results of the survey indicate that the key subfactors of the organizational readiness of KIBS companies in the Slovak Republic are the strategic orientation towards innovation openness, a qualified workforce and the processes of development of open innovation processes. A very important subfactor is also the knowledge about OI, which company management and employees have at their disposal, permanently share and further develop.

RQ 3: Which risks are the most significant for the process of organizational innovation in KIBS in the Slovak Republic?
Based on the findings of several authors, for example, according to West and Bogers (2017), Chesbrough, Euchner (2011), there are two types of OI processes: inside-out and outside-in. The authors Dahlander and Gann (2010) add a third, coupled process, to the two existing processes. The types vary depending on the flow of knowledge, with the coupled process linking these flows. The type of OI affects the mechanism of OI, its results but also the risks.

Table 6. The evaluation of the importance of the risks of open innovation in the conditions of KIBS in the Slovak Republic

The evaluation of the importance of the risks of open innovation						
Risks	Limited ability to develop and use intercompany relations	Limited ability to use external knowledge	Knowledge flow management	Increasing the complexity of processes resulting from cooperation with external parties	Development limitation of the internal skills and key technological competencies	Increase of the dependence on external technology providers	Limited ability to provide internal knowledge for external needs
Mean	4,25	4	4	3,5	3,25	3	2,75
Median	4	4	4	3,5	3,5	3	3

Source: authors' own processing of survey results, 2020

Not all risks arising from the application of OI can be accurately predicted, but it is generally possible to identify the most frequent risks. By testing the risks in the survey, we specified the most important and critical risks of the application of OI in KIBS companies in the Slovak Republic (Table 6), which are limited ability to develop and use intercompany relations, limited ability to use external knowledge and limited ability to manage knowledge flow. The ability of management and employees to share new knowledge or resources, cooperate with external partners, apply knowledge management in the business processes are the basic principles of open innovation, the absence of which threatens the success of OI implementation. The identification of the status of business processes and the preparatory phase of the application of OI is therefore crucial for the companies.

RQ4: What effects are created by the implementation of open innovation in KIBS in the Slovak Republic?
With the open innovation processes, many positive effects are created, it is necessary to define the goal that the company wants to achieve by applying OI. Based on this, the company can use the decision-making process to determine the scope of the project, the number and nature of the partners, the purpose of using open innovation, the risks of open innovation and others. It will answer the question of whether the implementation of open innovation is the best tool to achieve the goal, to gain competitive advantage and what other effects it can bring to the company.

Table 7. The evaluation of the importance of the effects of open innovation in the conditions of KIBS in the Slovak Republic

The evaluation of the importance of the effects of open innovation							
Effects	Competitive advantage	New revenue streams	New products and services	Improving customer relationships	Cost reduction	Strengthening relations with employees	Improving financial performance	Improving management skills
Mean	5	5	5	4	4	3,75	3,75	3,5
Median	5	5	5	4	4	4	4	3,5

Source: authors' own processing of survey results, 2020

The results of the survey indicate the key effects of open innovation in the conditions of KIBS in the Slovak Republic (Table 7), which are gaining a competitive advantage, generating the new revenues and creation of new products and services. Respondents consider the improvement of relations with customers, employees and partners, the reduction of production costs and the improvement of the company's financial performance to be very important effects.

Discussion

The OI model in KIBS in the Slovak Republic (Fig. 2) was compiled primarily from internal factors of open innovation and is focused on the business processes. The basis of the model is based on the Model based on OI life cycle framework (Krause and Schutte, 2016) and the Organizational Model of OI (Salampasis, 2015), as the application of open innovation itself depends, according to the several authors, mainly on the organizational structure of a company and its culture, which is based on the principle of cooperation.

According to the several authors, the open business model is a basic factor that should be part of all OI models. Within the last, third building block in the model, the basic factors were identified mainly from the Model of OI impact on a company's outputs (Farha, 2016) and supplemented by knowledge from the OI model focused on value creation (Aranha el al., 2015).

The model design therefore consists of the several previous models. Figure 1 graphically expresses the design of the Model of OI application in KIBS in the Slovak Republic.

The model consists of 3 building blocks, the first (planning and preparation for OI) is further divided into the factors: organizational readiness, company culture, organizational structure and open business model. These factors are supplemented by other subfactors that characterize them in more detail.

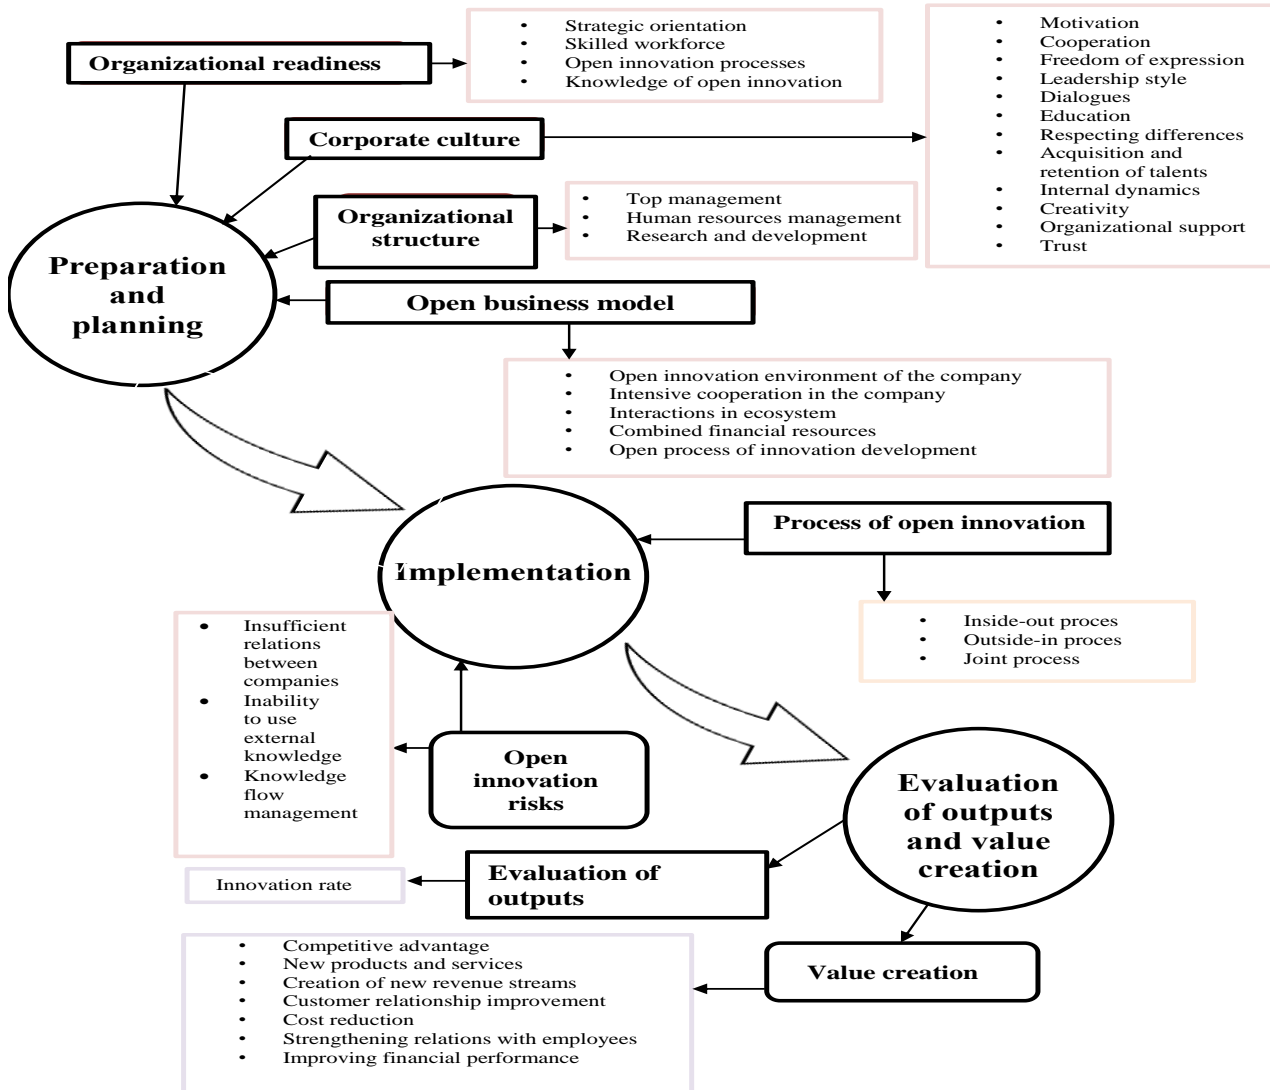
Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810


Fig. 2. The model of open innovation in KIBS in the Slovak Republic

Source: authors' own, 2020

The second building block (implementation of OI) is divided into the OI processes and the risks arising from these processes. The last, third building block of the model is divided into evaluation of outputs and value creation. This model makes it possible to express the innovative potential of the mechanism. This is expressed by the inputs to the open innovation mechanism through the evaluation and/or quantification of the proposed sub-factors listed under the "preparation and planning" building block. The effective use of the inputs of the open innovation mechanism is influenced by the way it is implemented, while the correct choice of a specific method affects the risks of OI. The model allows to measure the effects from the implementation of OI in KIBS. The

priority output of the OI system is the innovativeness of the subject expressed in the model by the level of innovation. Other measurable effects are aimed at creating value for the KIBS entity applying OI.

Value creation for a company is reflected in the sphere of its market position, product competitiveness, financial income and financial performance, customer relations, cost reduction and employee relations.

Conclusion

The position of KIBS in the Slovak economy can be described as significant not only with regard to the achieved economic performance and their dynamics, but also due to their function of transferring innovations to the value chains of production of the key sectors of the Slovak economy. The requirement of quality, availability and innovation of KIBS products in the Slovak Republic is an important condition for satisfying the intermediate demand of industrial companies in the Slovak Republic. Support for increasing the quality and performance of KIBS in the Slovak Republic is a challenge for the area of innovations and their management. The solution to the issue of open innovation systems is therefore very topical for the KIBS production environment in the Slovak Republic. We understand open innovation as a process of sharing knowledge and other resources beyond the boundaries of the company/corporation as part of an open business model with a number of different actors with which the company/ corporation cooperates. Open innovation is a mechanism enabling the use of synergistic effects from the sharing of innovation capacities of the participating actors, thus increasing the innovation potential of the company.

The study presents a model of open innovation, which is constructed on the basis of the identification of the factors, effects and risks of open innovation presented by the several authors and models. Subsequently, it is adapted to the conditions of KIBS production in the Slovak Republic based on the application of the Delphi method. The method was applied by asking experts from the environment of innovation management in knowledge-intensive business services (KIBS) in the Slovak Republic. The mentioned model is thus a functional tool for evaluating the innovation potential of a company operating in a relevant environment and a tool for evaluating the outputs of the OI mechanism applied in a given company.

The application of the presented OI model allows to achieve positive effects for the company producing KIBS. It is also important to realize that the impacts of the OI mechanism effects in KIBS will be notable for the relevant business environment. These are the schools, universities, businesses, public institutions and research institutions that enter into the processes of sharing not only the resources but also the effects as part of the functioning of the open innovation mechanism with KIBS company. This creates synergistic effects that can be identified not only in the KIBS environment, but also in other economic and social areas. The application of the model may be limited by the capital background of the company and its origin. Companies with multinational operations are subject to the management practices created by the parent company. These practices can accept other key elements of the open innovation mechanism that are functional in the environment of the parent company's economic and social conditions. Thus, the application of the proposed model within multinational corporations may not be accepted.

The specific application of the key elements of the OI KIBS model in the Slovak Republic is further dependent on the selection of indicators enabling accurate quantification of inputs (subfactors) and outputs (effects). This process is unique to a specific company/corporation. Further applied research in this area should be aimed at identifying specific indicators for a defined entity. At the same time, it is important to deal with the identification of barriers and critical points before applying the model in the specific conditions of the selected entity. The success of the application of the OI model in KIBS in the Slovak Republic may be influenced by the company's

Abstract. The current funding period of the European Union 2014 – 2020 advocates the application of the Smart Specialisation approach that has to be implemented on regional level. European NUTS-2 regions shall evaluate and reconsider their regional strategies for the upcoming funding period. Due to the high differences among the regions in terms of existing monitoring systems and policies, the performance measurement lacks a solid basis for a sufficient comparison, exemplification and transfer. In order to reduce this research gap, within this paper, the authors developed a comprehensible methodological tool using a given number of NUTS-2 regions with their distinctive monitoring systems and indicators in Central Europe. The benchmarking process is focusing on deploying existing performance indicators

from each regional strategy, analysing them and aiming at developing one common set of indicators. As a result, the developed methodology approach enables sufficient performance comparison in terms of RIS3 implementation in the current funding period on the one hand, and provides a crucial input for the future monitoring system design. As a result, the novel methodological tool yields contribution to both scholarly literature and practitioners. Furthermore, the benchmarking method provides various selection and combination options that allow direct insights in different fields' performance, such as regional spending to facilitate RIS3 implementation and Entrepreneurial Discovery process implementation as well. With this tool concerned, policy recommendations for the upcoming funding period and updates on the regional strategies can be drawn up.

Keywords: RIS3; Smart Specialisation; Benchmarking; Central Europe; Regional Innovation; Monitoring, Methodology; Common Set of Indicators

1. Introduction

In a rapid pace of transformation (digital, policy and environment driven) Europe is facing with, sustainability is a key towards Europe's future. Strengthening capitalisation of Smart Specialisation gets even more importance, when it comes to sustainable development in Europe and worldwide. Smart Specialisation and Regional Innovation Strategies on Smart Specialisation (RIS3) were used to serve for implementation of the Europe 2020 strategy and its goals, among them to harness the potential for Smart Growth from targeted support to areas with investments, thus prioritising direction and contribution for achieving Smart Growth ((COM(2010) 546 final). It was also used to serve as a methodology contributing to Sustainable Development Goals (SDGs) of the UN in the EU Member States and countries outside the EU. Indeed, the futured European concept of Smart Specialisation for the next programming period 2021-2027 highlights the sustainability dimension, which is regarded as a key driver in achieving and sustaining European competitive edge, in line with the European Green Deal (COM(2019) 640 final).

Though, the implementation of the next-generation sustainability strategy for Europe, the so-called "European Green Deal" as the new growth strategy for the EU requires strong policy report and significant investment plans. Yet, little is said about specific steps on how the strategy should be implemented on local and regional levels. In this light, the integration of Smart Specialisation as an EU policy to demonstrate efforts and potentials towards place-based innovation achievements for transformation and secure sustainable development becomes significant (Larosse et al., 2020). In this light, a strong knowledge and experience back-up – evaluation and monitoring – are crucial for the forthcoming funding period of 2021-2027, where the EU expects better performance and advancement of regional innovation. Therefore, monitoring is a key delivering relevant information base, supporting policy decision making and facilitating stakeholders' and citizens' engagement (Gianielle & Kleibrink. 2016, p. 95; Kleibrink et al., 2016, p. 1438; Mehta et al. 2019; Mazzanti et al., 2020; Mazzoni, 2020, Cismas et al., 2020; Khan et al. 2020). From the future perspective, this makes the current research *very topical*, as monitoring allows to counter measurement or steering related actions if they appear not to meet future perspectives.

Despite the recognised value of monitoring and evaluation within Smart Specialisation policy, in which monitoring and evaluation mechanisms build up the so-called 6th step of the RIS3 methodological framework, the related literature remains still scattered. Only few research and policy paper tracks support unfolding literature on RIS3 evaluation and monitoring (Arnold, 2004; EC, 2014; Gianelle & Kleibrink, 2015; Magro & Wilson, 2013; Masana et al., 2019; Panori et al., 2020; Prause, 2014). Literature on design and modelling (Boschma, 2014; Woronowicz

et a., 2016) as well as implementation of Smart Specialisation, i.e. process-based approach, is mounting, whereas monitoring and evaluation related issues are scarce (Gianelle & Kleinbrink, 2015). Indeed, this observation can be linked to an ex-ante conditionality the Smart Specialisation concept implies, where innovation policies are generated and implemented based on prioritised plans and follow in advance structured ways. Yet, monitoring and evaluation are crucial, as they foster policy learning, facilitate adaptation capability within a changing system, provide a solid basis for sustainable policy implementation (Aranguren et al. 2017; Gianelle & Kleibrink, 2016; Kroll et al., 2014; Magro & Wilson, 2015) and enable to reduce gaps in network structures (Virkkala et al., 2017).

Considering the fact that regional development remains at the core of each innovation policy, and regions should turn into learning ones by continuous improvement, knowledge region, facilitation of knowledge flow, ideas and learning (Florida, 1995, p. 532), monitoring and evaluation mechanisms appear to be crucial in order to make policy making in terms of Smart Specialisation solid and sustainable for the future (Kuznetsow & Sabel, 2003). Bearing this in mind, the research is driven by this *research problem* of the missing link between Regional Innovation Strategies for Smart Specialisation and their monitoring and evaluation mechanisms. Indeed, the existing evidence underlines that linking monitoring to the strategy's intervention logic places a significant challenge for policy makers and public programme officers (Farole et al., 2011, p. 1107; Kleibrink et al., 2016, p. 1456). A challenging nature bears also availability of data and identification of indictors to measure as well as a shared understanding and action among involved stakeholders (Kleibrink & Magro, 2018, p. 6). Indeed, indicators are important for sustainable development and planning performance measurement, thus implying positive changes at the end of the journey (Brugmann, 1997, p. 59). As a result, there is a huge emerging need for a systemic and holistic approach involving different governance mechanisms stakeholders.

Indeed, a marginalised focus on the monitoring and evaluation of RIS3 bears a rational academic and management practice-oriented researchers' response to provide a particular knowledge and data contribution in this rather porous research and policy field regarding RIS3. In that, the authors aim at giving more topical substance to RIS3 evaluation and monitoring by addressing and reducing the missing theoretical and practical foundations. When it comes to practice, evaluation and implementation of RIS3 on the regional level gets more blurred. Here, at is clearly stated, a common concept toward and a common set of indicators enabling benchmarking and thus monitoring of RIS3 on regional level are missing (Guzzo & Perianez-Forte, 2019, p. 18). This finding clearly postulates the research gap. As a result, the present research tackles the place-bound *research-to-practice gap*, where missing conceptual frameworks on RIS3 evaluation and monitoring on the regional level on the one hand dovetail with management tools regarding practical RIS3 evaluation and monitoring marshalled on the other hand.

The literature delivers only a limited number of records setting about regional dimension of RIS3 evaluation and monitoring, in particular within the cross-border, macro-regional perspective (INTERREG) and applied research orientation (regional development, SMEs competitiveness) (Angelidou et al., 2017; Bagienska & Rogowska, 2002; Woronowicz et al., 2016). Though, evaluation and monitoring efforts regarding RIS3 often remain in the design phase and usability of being deployed for tracing progress of RIS3 implementation is unexplored (Griniece et al., 2017, p. 4), followed by missing tools and methods reflecting the way in which the evaluation and monitoring can be used for the future policy revision and application (ibid., p. 6) and go beyond a narrow focus on meeting just audit requirements (Kleibrink et al., 2016, p. 1455). Finally, missing interlinking of policy approaches with theories frame the scientific research gap the authors want to address and reduce (Boschma, 2014; Foray et al., 2011).

The concerned research and practical management gaps were fuelled within the cross-border transnational (INTERREG) research project "SMART_watch" aiming at improving the links and between RIS3 monitoring and needs of end-users and involved stakeholders in RIS implementation. Within the framework of the Central Europe

Programme 2014-2020, the authors acting as work package leader for the design of policy recommendations pertaining to RIS3 evaluation and monitoring and future path of development. The research target groups include governance actors, like policy makers, triple or quadruple helix approach stakeholders (academia & research, government, industry and society) as well as current and potential users of RIS3, namely Small and Medium-Sized Enterprises (SMEs) and other businesses that build up the backbone of the regional economy. In this nexus, the present research raises two research question:

1) *How to compare and benchmark RIS3 performance of individual NUTS-2 regions within one European macro-region to enable cohesive and integrative future regional development driven by innovation?*

2) *How can a viable macro-regional and harmonised methodological and conceptual tool be constructed for comparison and benchmarking of individual NUTS-2 regions' performance in RIS3 implementation that goes beyond individual quantitative monitoring systems and indicators in Central Europe?*

As a result, using the empirical data from the participating Central Europe regions within the "SMART_watch", the researchers aim at developing qualitative conceptual and methodological frameworks that facilitate and enable policy actors and other stakeholders to undertake evaluation and monitoring of RIS3 implementation and equip them with toolkit enabling a reasonable decision-making. In particular, the authors propose a so-called common set of indicators dedicated to enable evaluation of RIS3 performance in a macro-regional perspective. In addition, the research proposes a benchmarking tool that can be transferred to and employed to other European regions. Indeed, the recent research is calling for more qualitative approaches and their use in participatory evaluation and monitoring (Kleibrink & Magro, 2018, p. 6). It is about harmonising conceptual frameworks and practical tools across EU NUTS 2 regions and making them functional in practice, thus empowering human capabilities to increase effectiveness of design and monitoring procedures in the future. By aiming at delivering the answer to the research question, the authors dovetail the research goals with the largely marginalised theoretical setting, which underpins the research scope and scale (evaluation and monitoring of the RIS3 implementation). Afterwards, the paper proceeds with the methodological considerations that are followed by comprehensive result presentation and discussion. Finally, implications for governance and stakeholder bodies involved in RIS3 evaluation and monitoring are displayed as well as research body on this particular field enhanced.

2. RIS3 evaluation and monitoring in policy and theory nexus

The overwhelming literature on Smart Specialisation, RIS and Innovation in Europe belong to the key building blocks that drive currently both researchers and practitioners. Yet, since Smart Specialisation refers to "policy running ahead of theory" (Foray et al., 2011, p. 1), academic approaches towards the conceptualisation have been so far highly marginalised, thus leading to missing manifestation of the concepts in the theoretical realm. Indeed, paramount scientific contributions on Smart Specialisation and RIS3 deliver rather policy-driven contributions that lack the dovetailing of the research with the existing and developing theories (Boschma, 2014; Fellnhofer, 2017). Paradoxically, as further development of RIS3 is subject to review for future improvements, current discourses shall highly demand strong proved theoretical foundations and not only focus on practice-driven approaches. In this regard, as well as with the aim to support topical discussion on RIS3 implementation evaluation and monitoring, the authors call for a solid systematic understanding deploying a bunch of applicable existing concepts and theories. For that reason, the researchers adopt a novel approach in the literature review of this paper by, first, conceptually linking up the intertwined policy discourses on RIS3 evaluation and monitoring province with applicable theoretical

treatises, and, second, providing a comprehensive but a simplified matrix with applicable theories that support and links research scope and scale through keywords.

2.1 Positioning RIS3 evaluation and monitoring in policy discourses

In order to make European economy more competitive against economies of US, Japan and other emerging world regions, such as China and South-East Asia, Europe made further attempts in advancing Europe's performance and regional development with the proposed strategy on smart, sustainable and inclusive growth in Europe – Europe 2020 strategy by the EC, followed by recent agendas to advance manufacturing and key enabling technologies "For a European Industrial Renaissance" (EC, 2014), and to prioritise community and customer experience in European innovation policy (EC, 2015). In this light, Smart Specialisation concept has moved from focusing solely on Research & Development (R&D) array towards a more *networked approach*, based rather on specific EU policy areas prioritisation and achievement of specific targets with the Europe 2020 strategy.

More than last three decades, discourses on Regional Innovation Systems (RIS) and strategic approaches towards Regional Innovation are ruling scholarly discourses as well as practical papers. A myriad of research papers and studies have evolved to underline the increasing role of innovation for European economy, in particular, cohesion, competitiveness and growth by means of RIS (Asheim et al, 2007; Asheim and Isaksen, 2002; Cooke & Morgan, 1997, Cooke, 2001). Following regional innovation agendas, in 2007-2008 a concept of "Smart Specialisation" was born, which addresses realisation of the European Research Area by means of development of *specialised clusters*, agglomeration of *knowledge resources* and building *knowledge hubs*, accompanied by *policy and institutional reforms*. It was launched by a team of experts working for the European Commission (EC) with the aim to provide new ways for recovery of European economy from the economic crisis and acceleration of European integration, including reduction of differences, assurance of more balanced evolvement of European regions as well as creation of the right conditions for *competition and cooperation* (EC, 2009; Foray et al., 2009; Giannitsis & Kager, 2009).

Smart Specialisation yields *integration of various stakeholders* from both public and private sector and postulates a complex *multi-level governance*. In the current funding period of 2014-2020, a concept of "Smart Specialisation" enjoys a growing interest on the European agenda, especially in order to safeguard sustainable and accountable use of EU Structural Funds (Iammarino et al., 2018), advance an outdated perception of regional innovation policy (Landabaso, 2014) and to bring more structured and legitimised way of proceeding by distributing EU funds (Foray, 2014; Kroll, 2019; McCann & Ortega-Argiles, 2013, 2015, 2016a, 2015b, 2015c) as an ex-ante conditionality for involved stakeholders (Griniece et al., 2017; Kroll, 2015; Martinez-Lopez & Palazuelos-Martinez, 2015). Not to forget, it is intended to streamline an *interplay and coordination* of the involved actors and stakeholders (Grillitsch, 2016; Larrea et al., 2919; Morgan, 2017; Panori et al., 2017).

Although evidence on Smart Specialisation and its growing popularity among policy makers is tremendous, majority of topical research and policy records appear to be circled around smart specialisation strategies and foresight (Paliokaite et al., 2015; Piirainen et al., 2017), consideration of place-based approaches (Kroll, 2015; Magro & Wilson, 2019) the role of institutions (Grillitsch, 2016), involvement of different level of governance (Arangunen et al., 2019) and regional institutional frameworks (Mazzucato, 2014; Krammer, 2017; Rodriguez-Pose et al., 2014). Within the evaluation and monitoring dimension of the EU RIS3 methodological framework, the key research streams also confirm the distribution of the keywords pertaining to governance, institutions, cooperation, collective learning, resource pooling and discovery. When it comes to the overview of keywords and their tailoring to specific theoretical approaches, concepts and theories, the following Table 1 heralds the key concepts driving the specific RIS3 area – evaluation and monitoring and their principal allocation to key theoretical foundations.

Table 1. Conceptual Keywords and their Provinces Driving RIS3 Evaluation and Monitoring Discourses

Keyword	Application Field	Application Meaning / Value	Conceptual Province	Research Record
(Re-) Definition of RIS3 outputs	Academics Policy makers Businesses	+ RIS3 governance improvement for future	+ Balanced scorecard + Business model innovation	+ Panori et al. (2020)
Decision-making (evidence-driven)	Policy makers	+ Strategic RIS3 management + RIS3 revision + Reducing information asymmetry, uncertainty and risk	+ Decision theory + Principal-agent theory + Game theory	+ Kleibrink et al. (2016) + Panori et al. (2020)
Participatory policy making and cooperation	Academics Policy makers Businesses	+ Informing about policy responses + Ensuring accountability & transferability of results + Participatory and inclusive approaches towards stakeholders	+ Network-based innovation theory + Open innovation	+ Kleibrink et al. (2016)
Entrepreneurial Discovery Process (EDP)	Businesses	+ Strengthening user-driven innovation + Engagement new actors in the EDP + Open platforms for cooperation + Attraction of talents	+ Open innovation + User-driven innovation + Design thinking + Service design	+ Cvijanovic et al. (2020)
Evaluation methods and criteria for RIS3	Policy makers	+ Means of learning & improvement for the future + Regional observation + Harmonised tools and data availability	+ Organisational learning + Absorptive capacity	+ Pires et al. (2019)
RIS3 Priority identification & investment horizons	Policy makers Businesses	+ Long-term prioritisation and planning + Anticipating long-term industrial and technological trends for transformation & emerging industries	+ Strategic foresight + Decision theory + Transaction Cost Theory	+ Ranga (2018) + Vezzani et al. (2018)
Policy learning and stakeholder communication	Policy makers	+ Learning from failure + Learning about transformation + Sustainable self-improvement cycles + Building & reinforcing trust and cooperation	+ Collective learning + Absorptive capacity + Path dependency	+ Bellini et al. 2020 + Kleibrink et al. (2016)
Stakeholders involvement and coordination in RIS3	Academics Policy makers Businesses	+ Developing programme for RIS3 monitoring improvement + Consultation, engagement and bottom-up participation + Support economically weaker regions with limited capacity for RIS3 monitoring through open engagement	+ Network-based innovation theory + Open innovation	+ Magro et al. (2014) + McCann (2015) + McCann & Ortega-Argiles (2016)

Source: Compiled by authors

The table above presents keywords and main concepts that are dominating in the literature and policy discourses when it comes to RIS3 evaluation and monitoring. The keywords and their interplay with the concepts and positioning with the theories are displayed in an alphabetic order not giving any specific weight to one or another. As this paper also serves for practical policy applications, it is intended to provide an overview and access to a basket key resources and theoretical foundations underpinning theoretical understanding.

2.2 Positioning RIS3 evaluation and monitoring in theoretical setting

The previous section contributes to embeddedness of the current research within the discourses of RIS3 evaluation and monitoring. In contrast to a myriad number of papers that deal with RIS3 and touch upon different aspects of RIS3, this paper concentrates on both understanding of RIS3 evaluation and monitoring from the conceptual and theoretical perspectives as well as delivering practical participatory tools. However, in order to easily trace and grasp key fundamental principles guiding RIS3 an especially its evaluation and monitoring is a colossal job. This is partly because of highly missing theoretical considerations in most of the scrutinised research literature, partly because of RIS3 standing for a highly complex phenomenon.

Innovation as the backbone of RIS3 is a theory and policy province showing intertwining of and integration with different concepts and theories. Because of its nature, innovation requires a tremendous understanding from different disciplines. Therefore, it is assumed that the most research misses a clear pinpointing of key applicable concepts and theoretical considerations by focusing mainly on general policy discussions. In order to facilitate the understanding and simplify the overview of the theoretical background, this present research has departed from the policy discussion and marshalling topical keywords that enable to trace the links with driving concepts and theories, innovation being the flagship and umbrella term. As a result, the authors of this paper argue, theoretical considerations can be circled around the following key building blocks bridging the gap in a comprehensive theoretical manifestation regarding RIS3 evaluation and monitoring, as compiled by the authors:

- Innovation (innovation generation, creative potential, openness, entrepreneurial discovery)
- Institutions, institutional arrangements and organisational culture (clusters, networks, hubs)
- Governance (multi-level horizontal cooperation, participatory inclusive stakeholder participation)
- Cognition, knowledge and learning (policy learning, participatory learning, absorptive capacity).

The core idea behind a systemic approach towards *innovation* is ex-ante strategic approach, a policy-driven way to spin off processes that enable both diversification, differentiation and new development paths. Already Schumpeter recognised the power of innovation for entrepreneurial activities by incessantly revolutionising economic structures in order to get better or more effective processes and products, the process known as "creative destruction". While doing so path dependency is an important precondition when defining strategy and patterns of organisational innovations (Schumpeter, 1947). Innovation and research in the 21st century both are increasingly becoming international endeavours and most innovations originate from multiple sources, with many drawings in components or technologies developed in multiple locations (Hayek, 2002). Potential evolutionary pathway of this innovation system is dependent on inherent structures and existing dynamics that have to do with the adaptation of radical transformation (Foray et al., 2012). Indeed, within the RIS3 multiple streams of insights on innovation intertwin. Whereas in early discourses innovations were regarded as those emerging only in firms, networks and clusters as well as multi-level and multi-cultural communities became sources in innovation process and enabled to combine internal and external knowledge bases (Pavitt 1984; Chesbrough 2003; Cooke, 2016; Asheim & Gertler 2005; Malerba 2005; Prause & Thurner 2014), approach actors at various spatial scales (Smith 2000; Tödtling et al. 2006), maintain different types of interactions and transfers (Gilsing et al. 2011) and focus on locally available capacities

and capabilities (Gertler & Levitte 2005; Boschma & Ter Wal 2007). As a result of differentiating socio-economic setting in Europe and especially on the regional level, in order to accelerate innovative capacity and overcome socio-economic obstacles there emerged a stronger need to address local and regional challenges (Courchene 1995; Porter 2000; Wolfe 2002).

By addressing key existing challenges in Europe, experts advocated use of smart specialisation process, i.e. particularise knowledge base in European regions (Foray & van Ark, 2008, p. 14). Actually, the idea of knowledge-based growth can be traced back also to learning and specialisation, which implies an interlinkage with the birth of evolutionary economics pointing out specialisation and learning as key drivers, e.g. within Adam Smith's "Wealth of Nations". Followed by profound treatises bridging learning and specialisation, like that of Schumpeter (1947), knowledge, technology and innovation are key sources enabling place-based specialisation (Fagerberg et al., 2004, Tiits et al., 2015; Ferreira & Seixas, 2019). In this light, an institutional perspective is important, since institutions play a crucial role in facilitating learning, knowledge spill-overs and specialisation itself. The key current challenges that jeopardise RIS3 evaluation and monitoring pinpoint a lack of matching needs between regional governance and actors involved in innovation discovery processes, lack of implementation of bottom-up approaches enabling participatory processes, lack of capability to design and implement RIS3 policies as well as capability to engage actively in the processes of entrepreneurial discovery (Capello & Kroll, 2016, p., 1397).

Indeed, local and regional challenges have been increasingly addressed by deploying the concept of RIS and clusters, which have seen a high rise among the place-based concepts (Aranguren et al., 2019). On the one hand, these concepts are bound to prevailing market forces, on the other hand, they presuppose a clear intertwining with the province of *governance* (Sotarauta, 2018). Indeed, in order to enable a smooth RIS3 implementation, actors from different sectoral arrangements are involved, like academic & research, policy, businesses (entrepreneurs) and society in large (quadruple helix-approach). Furthermore, a smooth RIS3 implementation is deemed to be bound to interaction and intra-institutional interplays among regional, national, supra- and subnational levels. Moreover, an efficient governance is deemed to be bound to path dependency. Certainly, when it comes to governance improvement for RIS3 evaluation and monitoring, ex-ante experiences gathered are crucial in shaping future decisions and future monitoring mechanisms (Aranguren et al., 2019; Boschma, 2015).

Governance easiness and level thereof is highly dependent on the institutional thickness and territorial capital. The last one makes a clear interlinkage to capacity and capabilities of institutions, which, in turn, are highly dependent on *knowledge base and absorptive capacity* (Cohen & Levinthal, 1990) or collective learning (Bellini et al, 2020). In this matter, absorptive capacity is crucial not only for RIS3 implementation but also for absorbing supply of research and innovation by local enterprises (SMEs) when designing and undertaking RIS3 evaluation and monitoring. In the same vein, the dovetailing of supply and demand sides, e.g. academic & research with local and regional SMEs and their needs might have a huge impact on the desire and ability of both sectors to work in the future (Kempton et al., 2013, p. 14). Certainly, lack of absorptive capacity for new knowledge and innovation as well as missing articulation of demand frequently results in less-innovative regions. It limits capacity and capabilities to access, acquire and apply new and external knowledge, cross-fertilise and making use of it on the market (Asheim et al., 2017, p. 9; Barzotto et al., 2019, p. 215). In fact, lack of strong governance structures and thin institutions without strong industrial clusters, networks and industry associations capable to supply with the needed information, knowledge and inputs (Fotakis et al., 2014, p. 35). In this regard, governance is crucial for connecting or reconnecting participants in RIS3 implementation to enable following evaluation and monitoring, as smooth cooperation among them is a key precondition for delivery of innovative, desirable and sustainable innovation outputs as well as generate a shared value. In addition, the integration of policy makers and experts within this dialog is also persuasive.

An overview of key theoretical concepts applicable for RIS3 evaluation and monitoring reveal that key challenges' blocks result from thin institutions and institutional arrangements covering governance, cognition and innovation processes. At the core of the challenging nature, there shall be discussed social aspects of actors' interactions pertaining to value delivery, shared value principals, leadership, asymmetric information flows, uncertainty, ambiguity, volatility, opportunism, bargaining power as well as transaction and monitoring costs issues. As a result, the authors call for the future research to build upon sound theoretical foundations, e.g. New Institutional Economies and related concepts and put the topic of RIS evaluation and monitoring in the tailored theoretical framework that enables to find practical challenge and problem-solving solutions.

3. Methodology

In the present research, the authors set out to forge a methodological / conceptual tool that supports RIS3 evaluation and monitoring on a macro-regional level by provide a practical method for benchmarking RIS3 implementation performance across the regional boundaries, i.e. by providing a harmonised tool. By scrutinising the topical literature, the researchers highlight that RIS3 evaluation and monitoring is to a great extent lacking conceptual foundations. As a result, the study applies hybrid research approach (Fereday & Muir-Cochrane, 2006, p. 80). Hereby, a combination of both inductive and deductive perspectives is done. From a deductive perspective, the research builds upon RIS3 evaluation and modelling approaches and traces key conceptual tenets. Subsequently, an inductive approach is used, since key insights from theory and practice are deployed to develop the methodological tool for practical applications. Indeed, the present research determines key building blocks and employs a specific structured approach by means of the developed outline (Fereday & Muir-Cochrane, 2006, p. 80; Crabtree and Miller, 1992, pp. 93-109). As a result, a methodological framework (common set of indicators) is constructed that is used for analysis and measurement as a certain template.

The research journey (design) encompasses the following key steps:
- Participating in the applied research project "SMART_watch" as key researchers regarding RIS3 evaluation and monitoring as well as policy recommendations.
- Developing tools for data gathering and monitoring within the project context, where the project serves as an overall case study.
- Gathering data from all 10 participation NUTS-2 regions from RIS3 reports (cases).
- Conducting expert interviews and making field notes in the frame of the project events (2018-2019).
- Analysing the gathered data by using thematic analysis method, social network analysis and memos.
- Undertaking thematic analysis of RIS3 evaluation and monitoring discourses and its positioning within the context.
- Distilling research streams and locating applicable concepts on RIS3 evaluation and monitoring only.
- Providing conceptual meanings of RIS3 evaluation and monitoring in the policy and theoretical nexus.
- Synthesising, comparing, smoothing and amalgamating data and presenting research results – set of indicators as a methodological tool for macro-regional RIS3 performance benchmarking.
- Validating research results.

Furthermore, the present scholarship has chosen a qualitative research approach. As noted by Kleibrink & Magro (2018), "*there is still a long way to go to systematically cope with this issue. This opens up room for the use of more qualitative approaches of participatory monitoring and evaluation*" (p. 6). By examining and interpreting data as well as determining key building blocks, the present research is able to comprehend the research phenomenon –

RIS3 evaluation and implementation within the regional discourses. With the qualitative research, a case study method is applied here (Yin, 2009, 2012), serving as an umbrella method and followed thematic analysis method (Braun & Clarke, 2006). Given the nature of the case study, the case study can be referred to as "building block" study on a phenomenon identifying common patters (Thomas, 2011, p. 515). In this, the research in hand is explorative, at it aims at contributing to the research field (RIS3 evaluation and monitoring, which seems to be underdeveloped (Shields & Rangarajan, 2013, pp. 26-27). In order to undertake an exploration, both integrative and interpretative syntheses techniques were introduced. Indeed, a synthesis has been achieved through pooling topical concepts in the research streams into higher-order conceptual approach (Dixon-Woods, 2005, p. 46).

In sum, it can be argued here that the present research was comprehensive, by addressing different aspects and combining diverse methodological perceptions applicable to the current research. Since the present research deals with innovation – a very complex phenomenon, research methodology needs also to underpin the comprehensive research nature. Yet, the authors made sound attempts in crystallising out research steps and endeavours.

4. Data synthesis – a way towards developing collective methodological tool

Reviewing the monitoring systems and especially the used indicators has shown, that the approaches in each participating region are overlapping in the methods. Namely, the following NUTS-2 regions were included in the analysis: Del-Alföld / Észak-Alföld (Ferenc et. al., 2013), Lubelskie (Sosnowski et. al., 2014), Mecklenburg – Western Pomerania (Strategierat Wirtschaft – Wissenschaft, 2014), Piemonte (Regione Piemonte, 2016), Slaskie (Matusiewicz, 2012), Slovenia - Eastern (Republika Slovenija, 2014), Styria (Kohrgruber, s.a.) and Veneto (Regione del Veneto, 2015). Regarding the indicators, in most regions two different types are used: output and result indicators. The labels may differ, some regions use the terms of performance or strategy indicators, but the idea behind is equal. One category of indicators refers to the results of the RIS3 implementation. They try to measure the direct impact of the implementation for the whole region by using key indices for innovation, research or economics – often measure in percentage. In some cases, the Regional Innovation Strategy provides a base value from 2011 and a target value for 2020. While Mecklenburg-Western Pomerania only published base values for 2011, the region of Silesia doesn't use base and target values.

The second category of indicators are related to outputs. They measure project specific values and provide a certain amount as target value to be reached in the funding period 2014 – 2020. All regions follow the idea to use such kind of indicators, but their definition or actual label can differ widely. Those indicators can be number of patents, EU financed projects, persons employed in a specific sector, companies with new business products, cluster, R&D subsidies, supported networks and so on. In preparation of the common set, some overlapping indicators could be identified, but considering the working steps after developing the set, this kind of indicators may lead to high challenges in the benchmarking.

To develop a joined set of indicators, the authors follow a conceptualisation influenced by various articles, such as Yazday et. al. (2009), Shahin & Mahbod (2007), Schwemlein et. al. (2016) and Maes et. al. (2016). In the first step, considered indicators have to be used at least in six regions. Since the indicators of the regions are not exactly labelled and measured the same. The resulting common set will be used as basic structure. In the second step, indicators which appear at least four and five times will be analysed individually. This second group can improve the amount and quality of the final set. But, for these indicators an explanation has to be provided to justify their contribution, since the amount of integration in the respective regions as reason is not feasible enough.

5. Displaying research results: methodological framework and harmonisation endeavours

As a result of research conducted, the authors analysed RIS3 documentation of 10 participating regions and provide the result overview in Table 2. The macro-regional indicator matrix, as showed in the table below, results from the comparison of the monitoring system in each region and the respective indicators. To create more add-value and flexibility regarding the upcoming benchmarking tool, the second set will be developed out of indicators, which are used by half of the regions. Both sets can be seen as final Common Set of Indicators.

The explained methodology leads in the first step to the following Table 2 with 15 indicators:

Table 2. Mapped Indicators in 10 analysed Central European regions

Name of indicator		
Expenditures on R&D at universities on GDP	Incidence of R&D expenditure on regional in GDP	Private investments to facilitate public support for R&D
Expenditures on R&D in private sector on GDP	Industrial SMEs introducing innovations as % of SMEs	Private sector spending on R&D as % of GDP
Expenditures on R&D in public sector and universities	No. of businesses with product and service innovations in % of SMEs	Public sector expenditure on R&D funded by business sector
Expenditures on R&D in public sector on GDP	No. of companies supported & cooperate with research institutes	Scientific employees
Incidence of R&D expenditure on national GDP	No. of patents and protection rights granted to national entities	Share of innovation-active companies

Source: Compiled by authors

To improve this set, the authors highlight the following indicators, which are used in at least four or five regions of the project consortium's regions:
- Spending on innovation in companies in the industry and service sectors other than R&D
- Share of R&D employees in private sector
- Number of companies supported diversifying product portfolio
- Number of companies supported introducing new products to the market
- Increase in business innovation activities.

The listed indicators are highly related to the Entrepreneurial Discovery Process and are able to measure the performance of it in the regions. Entrepreneurial Discovery Processes are one of the main phases of implementing Smart Specialisation Strategies. It is seen as a potential specialisation in which the knowledge contributed by the entrepreneur does not concern a technical invention (Larosse, 2013). Rather, it will relate to a new area of specialisation beneficial for the locale, given its existing productive assets (Forey, 2012). To cover this crucial part of the implementation process, the mentioned indicators will be added to the Common Set.
Therefore, the suggested Common Set of Indicators can be listed as in Table 3 below:

With the derived Common Set of Indicators, the Benchmarking of the chosen regions can be implemented. The set is used as required database for the benchmarking. For regions, the necessary (and available) data was collected and

standardised to create one final index for comparison of the implementation of regional Smart Specialisation Strategies.

Table 3. Common Set of Indicators

List of Indicators			
Expenditure on R&D in public sector and universities	Incidence of R&D expenditure on regional in GDP	No. of companies supported and diversifying product portfolio	Private sector spending on R&D as % of GDP
Expenditures on R&D at universities on GDP	Increase in business innovation activities	No. of companies supported and introducing new products to the market	Public sector expenditure on R&D funded by business sector
Expenditures on R&D in private sector on GDP	Industrial SMEs introducing innovations as % of SMEs	No. of patents and protection rights granted to national entities	Share of innovation-active companies
Expenditures on R&D in public sector on GDP	No. of businesses with product and service innovations in % of SMEs	Number of scientific employees	Share of R&D employees in private sector
Incidence of R&D expenditure on national GDP	No. of companies supported & cooperating with research institutes	Private investments to facilitate public support for R&D	Spending on innovation in companies in industry & service sectors other than R&D

Source: Compiled by authors

Additionally, we estimated a structure index covering the regional starting points in 2013 and 2014. This allows a better assessment of the final benchmarking index and comparison between relatively different regions.

Since the indicators are not available via one well-known dataset, scoreboard or scientific paper, different sources were taken into consideration for gaining necessary values. This also leads to different approaches to standardise the data as written in the following subchapters.

Following the idea of the methodology that yields to create a Common Set of Indicators, all indicators will be weighted depending on their frequency of use in the regions. Together with the normalised value, we receive a score for each indicator in all participating regions (ref. to Rickman & Schwer, 1995). However, the final benchmarking index will be estimated by the mean of all scores, as shown in the equation:

$$b_r = \frac{\sum_{i=0}^{n} m_i * x_{ri}}{n}$$

where b_r is the benchmarking index for the region r, m_i describes the multiplier for the indicator i and x_{ri} the normalised value for indicator i for the region r. The sum in the counter will be divided by the number of indicators n to achieve the final benchmarking index for the region.

In the following subchapters, the methodology for the multiplier, the normalised values and the structure index will be explained in detail.

Indicator Multiplier

Following the presented idea of collecting a common set for indicators to measure the implementation of Smart Specialisation Strategies, we can differ between different classes of indicators due to their frequency of appearance in the different regional monitoring systems. As an example, we want to take out the indicators "private sector spending on R&D in percent of GDP" and "share of R&D employees". While the first one is used as indicator for RIS3 implementation in all regions or is at least adoptable to one used indicator, the second one is only used in around 60%. Therefore, the value of the first indicator will have a higher influence on the final benchmarking score due to the mentioned multiplier m_i. The following Table 4 shows the multiplier for every indicator of the common set:

Table 4. Common Set of Indicators

Name of indicator	Weight
Expenditures on R&D at universities on GDP	1,2
Expenditures on R&D in private sector on GDP	1,2
Expenditures on R&D in public sector and universities	1,2
Expenditures on R&D in public sector on GDP	1,2
Incidence of R&D expenditure on national GDP	1,2
Incidence of R&D expenditure on regional in GDP	1,2
Increase in business innovation activities	0,6
Industrial SMEs introducing innovations as % of SMEs	1,0
No. of businesses with product and service innovations in % of SMEs	1,2
No. of companies supported & cooperate with research institutes	1,2
No. of companies supported diversifying product portfolio	0,6
No. of companies supported introducing new products to the market	0,6
No. of patents and protection rights granted to national entities	1,0
No. of scientific employees	1,2
Private investments to facilitate public support for R&D	1,0
Private sector spending on R&D as % of GDP	1,2
Public sector expenditure on R&D funded by business sector	1,2
Share of innovation-active companies	1,0
Share of R&D employees in private sector	0,6
Spending on innovation in companies in the industry & service sectors other than R&D	0,8

Source: Compiled by authors

Basically, indicators that are taken into consideration in all regional monitoring system receive a multiplier of 1,2. The weights are fixed according to the amount of appearances (Berger & Bristow, 2009). Whenever a region is missing, we subtract 0,2, which means that a multiplier of 0,6 is given to an indicator, that is not used by three regions.

Introducing a multiplier helps to generate a more feasible final benchmarking score, since a good performance in an often-used indicator in monitoring systems is appreciated in the final score as well. On the opposite a low used indicator doesn't prosecute bad performance that much.

Normalised Values for Indicators
To yield comprehensible values for all indicators across the respective regions, the authors collected the necessary data through four different methods by using different data sources. All four ways of data gaining are presented in the following subchapters. However, the authors preferred the first option that follows directly the regional monitoring system of each region. Nevertheless, only a few normalised values could be taken out from this option. This results in a lack of information out of the regional strategy papers, which do not provide all necessary information to trace the idea of the respective region on how to get the data / values.

Values from regional Smart Specialisation Strategy Documents
By analysing the regional strategy documents in the frame of the development of a Common Set of Indicators, a collection of the used values for all regions was developed. In some regions, the responsible institutions for implementing the Smart Specialisation Strategy defined start and target value of the indicators used in the monitoring system for the current funding period. This allows an easy measurement of the implementation by comparing the defined target value for 2020 with the latest value, that is provided for the respective indicator. Having this in mind, the value x_{ir} can be obtained as follows:

$$x_{ir} = \frac{t_{ir} - s_{ir}}{y_{ir} - s_{ir}}$$

where t_{ir} and s_{ir} are the target (2020) and starting value (2014) defined by the regions. y_{ir} is the latest value the authors were able to collect for the respective indicator. Therefore, equation (2) describes the resulting value as rate of the difference between planned performance and actual performance. If the region is able to achieve the planned target value, the value for the indicator would be $x_{ir} = 1$, while underperformance yields in $x_{ir} < 1$. However, $x_{ir} > 1$ is also a possible value, but it should be reminded, that the target values are defined for 2020 and the latest values are mostly accessible for 2018, which means that the data demands a two years gap.

Normalised Data via Regional Innovation Scoreboard 2019
Since not all regions provide the necessary information to follow previous options and / or the strategy paper do not present the methodology how the data was normalised or from which sources it was taken, another option has to be considered to get the necessary data for a useful benchmarking.

As it is shown in the Annex I, some indicators of the common set can be represented via indicators that are used in the Regional Innovation Scoreboard. The scoreboard is provided by the European Commission on a yearly basis, by analysing the NUTS2 regions. This allows us, to use the latest available data from a validated data source (Hollanders et. al., 2019).

The Scoreboard provides three information to create the normalised values for the respective indicators. Therefore, we can use different approaches to obtain the demanded normalised value. The first option is used, whenever the Scoreboard provides the data in relation to the European and national level of the respective indicator:

$$x_{ir} = \frac{(e_{ir} + l_{ir}) * 0,007}{2}$$

where e_{ir} is the score taken out from the Regional Innovation Scoreboard for the respective region in relation to the European level and l_{ir} the score in relation to national level. The values are multiplied with 0,007, since we assume 0,7 as value for the mean performance in the frame of Smart Specialisation implementation. By dividing the score in the counter with 2, we obtain the normalised value for the indicator of the respective region.

As second option, we use the provided value for some indicators, which are not related to European and National level. In this case, the mean of all European NUTS2 regions was calculated by the authors from the Regional Innovation Scoreboard. Having the European mean value and the regional value, we can obtain the normalised value for the benchmarking by using:

$$x_{ir} = 0,007 * \frac{z_{ir}}{m_i}$$

where z_{ir} is the value taken out from the Scoreboard and m_i the calculated European mean for the respective indicator i. Again, we are multiplying 0,7 since we assume that this is the value for mean performance. This assumption follows the Lithuanian Ministry of Education and Science (2010) labelling $67 - 74$ % as an average performance.

Normalised Data via Regional Competitiveness Index
In addition to the Regional Innovation Scoreboard 2019, data from the Regional Competitiveness Index were used to fulfil the database for the benchmarking tool as shown in the Annex I. The Competitiveness Index is also a yearly provided source for NUTS regions to measure the competitiveness performance and readiness in business sectors (Annoni & Dijkstra, 2019).

The Index provides a value for every European NUTS2 region. Therefore, the same method can be used as earlier in option two for the Regional Innovation Scoreboard. Therefore, we use again

$$x_{ir} = 0,7 * \frac{y_{ir}}{m_i}$$

where y_{ir} is the value taken out from Competitiveness Index and m_i the calculated European mean of all regions for the respective indicator i. As mentioned before, we are multiplying 0,7 as value for mean performance.

Normalised Data via EuroStat
As third validated data source, EuroStat as official statistical institution of the European Commission located in Luxembourg was used to obtain the remaining data (European Commission, 2019). Once again, for every region and the respective indicator, a value could be taken out from the database. Therefore, the equation is nearly the same as before:

$$x_{ir} = 0,7 * \frac{a_{ir}}{m_i}$$

where a_{ir} is the value taken out from EuroStat and m_i the calculated European mean of all regions for the respective indicator i. The fraction is multiplied with 0,7 due to the mentioned assumption of mean performance.

Normalised Data using a combination of data sources
For some indicators, none of the shown methods were feasible. This results in a lack of information / data or in the understanding of the indicators content. Therefore, the authors conduct for the following indicators an individual approach to obtain normalised data:

- Incidence of total R&D expenditures on GDP.

To achieve a normalised value for this indicator, we use a combination of the previous shown methods. This includes data from the Regional Innovation Scoreboard and Eurostat. The equation is built as follows:

$$x_{4r} = \frac{(0{,}007 * (l_{5r} * l_{6r}) + x_{7r})}{3}$$

where l_{5r} is the value from the Scoreboard in relation to national level for the indicator "expenditures on R&D in private sector referring to GDP", l_{6r} the value from the Scoreboard in relation to national level for the indicator "expenditures on R&D in public sector referring to GDP" and x_{7r} the value for "expenditures on R&D at universities referring to GDP" taken from EuroStat by using the presented method.

Incidence of R&D expenditures on regional GDP
The normalised value for this indicator follows directly from the presented above. To obtain the normalised value additional data from the Regional Innovation Scoreboard is used.

$$x_{3r} = x_{4r} * \frac{GDP_n}{GDP_r}$$

where GDP_n is the national and GDP_r is the regional Gross Domestic Product taken out from the Regional Innovation Scoreboard. That means, we multiply the value for indicator No. 4 with the relation between national and regional GDP to obtain a normalised value for this indicator.

Structure Index
The Structure Index is based on an idea and tool published on the S3-platform by the European Commission. It tries to identify the characteristics in terms of structural conditions for the participating regions at the beginning of the Smart Specialisation funding period 2014 – 2020 (Navarro et. al. 2014). Those characteristics are seen as fixed in the short term and reflect the way innovation and economic evolution happen in the region. However, for the developed benchmarking tool described in this report, the provided structure benchmarking tool is not sufficient, since it shows the 35 nearest regions from all European NUTS2 regions to the selected one. This doesn't allow a comparison between the participating regions which are highly different what excludes them in the provided tool.

To solve this problem, we access the data from Regional Innovation Scoreboard and Regional Competitiveness Index. The database described for the European structure tool can be covered in a sufficient way by the two mentioned data sources. To obtain a structure index, we use the final scores from 2013 and 2014 from the data sources. Therefore, the structure index u_r can be written as

$$u_r = \frac{(RIS_r^{2013} + RCI_r^{2014})}{2}$$

where, RIS_r^{2013} is the total index score for the region from the Regional Innovation Scoreboard in 2013 and RCI_r^{2014} is the total score for the region taken from the Regional Competitiveness Index.

6. Methodological framework in practice – benchmarking RIS3 performance in Central Europe

By using the described methodology, the research yields the following result table for the regions:

Table 5. Benchmarking results

Region	Structure Index	Benchmarking Index
D./E.-Alföld	-0.19425	0.4841
Jihozápad	0.1928	0.5383
Lubelskje	-0.1297	0.5135
Mecklenburg Western-Pomerania	0.53495	0.6689
Piemonte	0.3194	0.8307
Silesia	0.05105	0.4425
Slovenia – Eastern	0.3407	0.6158
Styria	0.63685	0.8965
Veneto	0.29255	0.6333

Source: Compiled by authors

As best performing region Piemonte can be indicated with the highest performance value, followed by Styria and Mecklenburg Western-Pomerania. Latter regions have the highest Structure Index compared to all regions, but obviously lose their front positions to Piemonte, which is starting from an average point in the frame of the Structure Index with 0.3194. Slovenia – Eastern possesses a well comparable Structure Index with 0.3407, but can't provide the same level of performance according to the Benchmarking Index.

Furhermore, the regions Lubelskje and D./E.-Alföld provide a negative Structure Index due to the negative value taken from the Regional Competitiveness Index. However, both regions obtain an average score overtaking Silesia, which started with a value of 0.05105 and is indicated as region with the lowest performance.

In the following, we will edit the benchmarking in two scenarios to create an analysis on specific fields. We will compare the Benchmarking Index from Table 5 as standard value with the yielding index after editing. An increase of the Benchmarking Value leads to the interpretation that the respective region is under-performing in the chosen field, since we exclude low values. In return, if the Benchmarking Index decreases, we can assume that the respective region is well performing, since we excluded high values.

To provide a clearer performance measurement, the indicators related to the GDP shall be excluded. Due to their measurement, that is relying on spending compared to regional and / or national GDP, it could lead to a bias in the performance measurement. Therefore, the seven respective indicators are excluded to obtain the Benchmarking Index. Table 6 shows the results.

Table 6. Benchmarking results after excluding GDP related indicators

Region	Structure Index	Benchmarking Index	Benchmarking Index (without GDP indicators)
D./E.-Alföld	-0.19425	0.4841	0.4000
Jihozápad	0.1928	0.5383	0.4985
Lubelskje	-0.1297	0.5135	0.3873
Mecklenburg Western-Pomerania	0.53495	0.6689	0.5633
Piemonte	0.3194	0.8307	0.6674
Silesia	0.05105	0.4425	0.4396
Slovenia – Eastern	0.3407	0.6158	0.6431
Styria	0.63685	0.8965	0.7965
Veneto	0.29255	0.6333	0.6235

Source: Compiled by authors

Table 6 shows that only Silesia and Slovenia – Eastern can increase their score after excluding GDP-related indicators. The remaining regions suffer a decrease. The highest decrease can be seen for the region Piemonte, that leaded the first measurement with all indicators. The interpretation behind the realised scores is as follows, regions with a decreased score spend an amount of money to facilitate Smart Specialisation implementation that is not corresponding to the realised performance. On the other way around, those regions – Silesia and Slovenia – Eastern – have an over-performing related to their spending in relation to the GDP.

In another scenario, we exclude those indicators that are linked to Entrepreneurial Discovery Processes (EDP) (Larosse, 2013). As mentioned earlier, we identified five identified five indicators which are directly connected to EDP. Table 7 shows the yielded results.

Table 7. Benchmarking results after excluding EDP indicators

Region	Structure Index	Benchmarking Index	Benchmarking Index (without EDP indicators)
D./E.-Alföld	-0.19425	0.4841	0.5526
Jihozápad	0.1928	0.5383	0.6054
Lubelskje	-0.1297	0.5135	0.6057
Mecklenburg Western-Pomerania	0.53495	0.6689	0.7804
Piemonte	0.3194	0.8307	0.9556
Silesia	0.05105	0.4425	0.4878
Slovenia – Eastern	0.3407	0.6158	0.6758
Styria	0.63685	0.8965	1.0321
Veneto	0.29255	0.6333	0.6808

Source: Compiled by authors

1376

Those regions, that suffer from a decrease can be attested a good performance in EDP implementation since their high values are excluded in this scenario. However, only Lubelskje provides a mentionable decrease of the value and can be identified as best performing region in terms of EDP. In return, Styria, Piemonte and Mecklenburg Western-Pomerania provide the highest increase in their Benchmarking Index. The logical interpretation leads to an under-performance in terms of EDP in those regions, since we excluded low values measuring EDP.

7. Conclusions

The first research objective of this paper was to elaborate and analyse how a comparable benchmarking of NUTS-2 regions for their Smart Specialisation implementation can be established as a crucial step for future regional development and innovation policies. Given the topicality of the transition to the new funding period and launch of European growth strategies such as the European Green Deal, monitoring and evaluation of RIS3 and its missing theoretical concepts and scientific foundation was analysed within the undertaken research. The introduced methodological framework including a common set of indicators steps in to the gap of missing collaborative approaches of European NUTS-2 regions.

As a second research objective, the paper in hand provides a conceptual and methodological tool for performance comparison of individual NUTS-2 regions RIS3 implementation. The conducted research analysed and elaborated the positioning of RIS3 monitoring in contrast with latest policy discourses and theoretical settings. So far, a unified concept as well as the link between Smart Specialisation policy approach and theoretical concepts for monitoring was missing. The tool fills in this gap and contributes to the current political discourse on innovation policy governances and policy learning for future Smart Specialisation Strategy development and implementation.

The benchmarking methodology is considered for a limited number of regions in the frame of the Regional Implementation on Smart Specialisation Strategies (RIS3). After a detailed review of the published regional strategy documents, the presented monitoring systems and their indicators were used for a comparison and measurement of the appearance for each indicator. We emphasised a set containing 20 indicators to measure Smart Specialisation. To collect the necessary data, we focused on the provided measurement in the regional strategy documents. However, due to the fact, that regions partly did not provide detailed explanation how they collected the data (ref. to Ferenc et. al., 2013, Sosnowski et. al., 2014 and Strategierat Wirtschaft – Wissenschaft, 2014) we introduced a method to receive the necessary data from well-validated databases. To enlarge the result analysis, enable sufficient data interpretation and provide a better performance comparison, Structure Index of each regions are included, which shall cover the "starting point" for each region at the beginning of the Smart Specialisation funding period 2014 – 2020.

By using the explained Benchmarking method, we received first results on the performance, indicating Piemonte with the highest value. After editing the set of indicators by excluding GDP related values, we provided the assumption, that except Silesia and Slovenia – Eastern have a spending to facilitate the implementation of Smart Specialisation, which is not corresponding to the measure outcomes / performance. This is a crucial insight in the development of political recommendations for adjustments of the current regional strategies.

Furthermore, we analysed the implementation of EDPs by editing the indicators. The result table has shown, that Lubelskje region is best-performing of the analysed regions. For the weak performing regions such as Silesia, Slovenia – Eastern and D./E.-Alföld the implementation of EDP in the funding period was not successful and should receive a higher focus in the development of the upcoming regional strategies.

The presented approach for Benchmarking provides a flexible methodology, which can be generalised on every NUTS-2 regions and even on smaller and larger scale. However, the methodology is limited in the number of regions that are considered to develop a set of indicators. Since regional development in terms of innovation and the regional policies behind are highly different, the methodology will not provide a sufficient set if the number of regions is too high. Nevertheless, it is a valid measurement to benchmark a certain number of different regions. The methodology may be used especially for neighbour regions to derive recommendations in the implementation processes and facilitate cross-border insights.

Abstract. Smart Specialisation is dedicated to be a key driving force for entrepreneurial discovery and innovation in the European innovation policy paradigm in line with the European Strategy 2020 and the funding period 2014-2020. At the current stage, all EU NUTS-2 regions are monitoring their individually developed Regional Innovation Strategies on Smart Specialisation (RIS3) including monitoring systems that are needed to adjust upcoming future RIS3 strategies in the new funding periods. Despite the thematic topicality, the procedure of RIS3 evaluation and monitoring lacks a sound supra-regional approach when it comes to RIS3 implementation performance governance and institutional arrangements across all European regions. In fact, the blurring of RIS3 monitoring can be traced back to the policy nature that monitoring systems are set up, implemented and evaluated on individual regional and or national basis including a set of regionally tailored regional and national indicators. With regard to the policy challenges and research gaps of developing, and, later, using a joint macro-regional systemic institutional approach towards RIS3 implementation and monitoring, this paper provides a conceptual model for RIS3 performance, evaluation and monitoring governance based on case study analysis, best practices from RIS3 research and policy stakeholders' interviews. It is intended to serve as a comprehensive and comparative governance model on regional, national and

European level, which fosters the institutional thickness and institutional multi-level horizontal cooperation among institutions involved in RIS3 performance and monitoring implementation. Within the empirical narrative, 10 NUTS-2 regions within the INTERREG Central Europe Programme area and in the frame of the "SMART_watch" project were subject to the analysis pertaining to their strategy design, priority axes and monitoring indicators. As a result, the so-called Transnational RIS3 Observatory Model was designed, which yields conceptual linkages to theoretical concepts using cluster theories as well as builds upon practical policy-driven approaches mushrooming in the innovation policy paradigm of the European Union. Furthermore, recommendations to foster the RIS3 policy implementation in the upcoming funding period are introduced in line with the setup of the observatory structure and its institutional embeddedness.

1. Introduction

The Smart Specialisation approach is one of the key pillars of the Europe 2020 Strategy in terms of economic development and growth policy thinking (McCann & Ortega-Argilés, 2011) as well as an approach to avoid dissipation of European Union (EU) funds among regions (Rusu, 2013). The basic idea can be traced back to the rising productivity gap between Europe and the USA in mid 90's, when European policy makers had to look for alternative policies to impede further economic decline. After announcing the Regional Innovation on Smart Specialisation (RIS3) initiative as a new novel policy on European level, all NUTS-2 regions were given an opportunity to develop individual strategies according to the available top-down policy agenda as well as design sufficient monitoring systems. With the ending of the funding period 2014-2020, RIS3 strategies will be monitored on achievements regarding successful RIS3 policy implementation. As a result, a bunch of recommendations to amend RIS3 shall be provided for the future EU funds' programming period and respective institutions and bodies involved in strategies' future design and implementation.

To continue sustainable development in Europe, the European Green Deal was announced as the new growth strategy for the EU towards a more sustainable economic and society (European Commission, 2019). This strategy aims at covering all key driving EU economic sectors by introducing new growth opportunities and activities. However, new strategic governance capacities are required for successful implementation (Larosse et. al., 2020). The Smart Specialisation approach follows the same idea to identify and use regional potentials to support innovative and competitive development. Therefore, Smart Specialisation policy can serve as a key pillar in the European governance transformation to reach the objectives of the European Green Deal until 2050. Thus, a specialisation by the regions using Key Enabling Technologies (KETs) or Knowledge Intensive Business Services (KIBs) to particular fields or priorities is unavoidable. The Baltic Sea Region serves as a flagship region among other EU macro-regions showing efficient and effective resource pooling and utilisation of capacities to reduce current challenges, e.g. in the maritime shipping and transportation area or innovation development in SMEs (Gerlitz, 2016). Currently, all European regions are revising their strategies for the next funding period starting in 2021 and pertaining to future regional innovative growth, including the elaboration to improve the RIS3 policy implementation (Gianelle et. al., 2020). Within this discourse, monitoring experiences frame a key focus and serve as an information pool for any potential future changes needed to be introduced by policy makers.

Therefore, it is crucial moment right now to revise the monitoring systems of the regions in between the funding periods.

Due to the existence of individual region-based monitoring systems according to regional requirements, the results of current monitoring approaches lack any comparability. This bears a clear *problematic nature*. Moreover, some European Member States have introduced national strategies reinforcing regional ones or substituting them. As a result, the regional and national level considerations cannot be excluded from the current research discourse. Controversy, regional policy-making involved in innovation has a very limited impact on the Research and Innovation Strategies on Smart Specialisation (RIS3) programming (Marques and Morgan, 2018) due to risk-averse behaviour that restricts experimentation, flexibility and public initiatives as well as leads to being threatened due to the transparent bottom-up approach in the programme (Landabaso, 2014). Nevertheless, regional bodies play an important role for informal factors in institutions such as trust, responsibility, partnerships and regional leadership (McCann & Ortega-Argilés, 2014). In addition, innovation systems are proved to have the strongest impact on NUTS-2 levels (Ruhrmann et. al., 2020). Thus, a lack of successful and open-minded innovation policy governance impedes the set-up of Smart Specialisation strategies and their monitoring. Albeit, the European Smart Specialisation approach does not provide a framework on policy governance (Capello & Kroll, 2016). Hence, the need for an acceptance of the mutual action and reaction roadmap among institutions forging regional development and innovation is growing, including actual positioning, responsibilities' sharing as well as pinpointing cause and consequence relations, which at the current stage are unknown (Morgan, 2016). In this light, the practice-based model that is acknowledged among 10 NUTS-2 regions and is proposed by this research is seen as referred to as a contribution surpassing a simple necessity to meet this particular challenge.

The paper in hand displays the research done on evaluation and monitoring processes in line with RIS3 implementation by addressing the *research gap* of a missing comprehensive and comparative monitoring method and concept for RIS3 implementation across the whole European Union (EU). As a result, the present research contributes to the still missing theoretical and conceptual framework when it comes to Smart Specialisation (Andersons & Bushati, 2019). In the current funding period, the European Commission used a benchmarking based on structural similarities only (Navarro et. al., 2014), but did not focus on the actual implementation performance. Therefore, this research raises the following research question: *How can a functional model be implemented across the EU on all necessary levels (European, National [optional] and Regional) that enables Smart Specialisation monitoring for the regional innovation policy implementation?*

This paper is organised as follows. In the next chapter, the main theories used for this research will be presented. Key references to underline the theories as well as research gap are incorporated to this chapter. Next, the used research methodology including its scope and characteristics is provided. The fourth chapter includes the research results and the actual development of the Transnational RIS3 Observatory Model as tool of Smart Specialisation governance, ending with a concluding section summing up main insights and further research proposal.

2. Theoretical Background

The monitoring of RIS3 performance was not tackled in detail by previous literature. Mora et. al. (2019) identified current scientific trends in research on smart specialisation, but did not indicate any increasing numbers of scientific work on monitoring activities, despite the fact that monitoring became more relevant at the end of current funding period. Gianelle & Kleibring (2015) arrange monitoring activities in the overall implementation context for smart specialisation implementation. Further, Marti et. al. (2020) analysed the key next steps to

support region's capacities in evaluation and monitoring of smart specialisation outputs. In addition, they highlighted the need to introduce better mechanisms to compare the processes and outcomes across regional borders. In this light, the present paper aims to fill this identified gap of missing monitoring approaches that integrate all relevant actors on regional, national and European level.

Further literature proposes solutions to foster or analyse the individual monitoring processes on regional or national level, such as Gulc, 2015; Angelidou et. al., 2017; D'Adda et. al., 2019; Cismas et al., 2019;; Jasinska, & Jasinski, 2019, Rane Santosh,& Thakker Shivangi, 2019). Kogut-Jaworska & Ociepa-Kicinska, 2020; Adeleke Abayomi et al., 2020).

Masana & Fernández (2019) introduce the term "learning" to the monitoring process and the European Commission indicates examples as best practices for regional monitoring (European Commission, 2020). However, all screened literature proposals lack performance measuring comparability with (all) other European regions in terms of RIS3. Acevedo (2019) presents dimensions to compare smart specialisation development of one specifically chosen region with others, but the approach is not transferable on a general level. Furthermore, innovation measurements like the EU 2020 Innovation indicator cannot be seen as a feasible instrument for RIS3 performance measurement due to the focus on innovation outcomes only (Janger et. al., 2017).

The present paper proposes a model filling the identified research gap with the transnational RIS3 Observatory Model approach by using clustering construct. Clusters are interconnected companies and institutions in a particular thematic field with a certain geographic concentration (Porter, 1998), but can also be elaborated as tools for regional development as a reduced scale innovation system (Gagnidze, 2015). The European Commission highly supports cluster strategies within the European growth strategy 2020 (European Commission, 2016a; Ketels & Protsiv, 2016; El Idrissi et al., 2020). Pavone et. al. (2020) recently published an analysis on clustering NUTS-2 regions according to their specialisation strategies.

In addition to cluster theories, innovation policy governance concepts are considered for the model development. Innovation policies in line with RIS3 are meant to be a multilevel approach, containing stakeholders' involvement according to the quadruple-helix approach that pools together various actors within the innovation system governance (Aranguren et. al., 2019). Mainly, the Entrepreneurial Discovery Processes (EDP) combines the interaction of all actors and their different levels under one innovation policy and transforms the strategy to reality in the regions (Grillitsch, 2016). Another key pillar is the RIS3-driven policy learning (Gianelle et. al., 2019), the ability to transform theoretical concepts to innovation policies and implement policy changes to support the regional (innovative and sustainable) development.

The presented model is based on both theoretical concepts – cluster theories and innovation policy governance – and pinpoints synergies from both concepts which can generate further add-value. In addition, enhancers of smart economic development such as networking, learning, innovation and knowledge facilitation are considered to be inherent in the model (Dagiliene et. al., 2019). Furthermore, the transnational RIS3 observatory Model fulfils the proposed requirement by the European Commission (2016b) that any Smart Specialisation Strategy programme demands a multi-scalar-co-ordination among supra-national, national and sub-national actors in Europe.

3. Research Methodology

The present paper provides inductive perspectives, analysing chosen regions on their strategy design, implementation and monitoring to identify key insights to explain a phenomenon on the European level. Furthermore, with the analysed cases, this research paper deviates and constructs applicability and transferability options for all regions of the European Union.

Taking the proposed research gap into account, the argumentation of Creswell (2014) using qualitative approaches to explain and analyse a concept or phenomena can be followed. In the field of Smart Specialisation research, qualitative research approaches are preferred to explain political interventions on innovation governances (such as Björn & Johansson, 2017; Georghiou et. al., 2014; Komninos et. al., 2014; and Kroll et. al., 2016). The research strategies implemented can be classified according to the research onion of Saunders et. al. (2009) as the following:
- Case studies,
- Action Research, and
- Grounded theory.

The conducted research paper is using case studies of the "SMART_watch" project and participating regions representing European NUTS-2 regions. At a first glance, the regions were analysed individually using their published Regional Innovation Strategies on Smart Specialisation. Especially the chosen priority axes and monitoring systems with used indicators were scrutinised in the analysis, developing an overview on same priorities among the regions. In the next step, responsible bodies and their duties within the strategy implementation were considered, investigating for best practices to be adopted and transformed for other regions. Therefore, the case studies were highly funnelled into the main part of the implemented research, while action research and grounded approaches accounted for rather a lower share on the overall research process.

Action research was used after the first analysis of the strategy document of individual EU region to explore structural units within the model as a problem-solving approach. The stated issue on a missing comparability with existing monitoring systems can only be overcome with major organisational and governmental changes in line with the Smart Specialisation policy. The necessary information and insights have been gained in cooperation with practical actors (Huang, 2010) within the work done in the "SMART_watch" project and conducted short surveys and expert interviews. In contrast, grounded theory, according to Charmaz (2014), perceived as method to construct theories and recommendations from analysing qualitative data was incorporated to the research when developing conclusions and theories on improvements for Smart Specialisation monitoring systems based on the actual existing data within the regional strategies.

Based on this multi-method research methods, further literature reviews identified the mentioned research gap as well as actual regional needs and circumstances to implement a sufficient monitoring model, which ensures regional performance comparability of all European regions. Therefore, four research techniques can be summarised as basis of this paper:
- Research scope: 2018 – 2020, SMART watch applied research project
- Research methods: case studies, action research and grounded theory
- Research actions: desk research, empirical data analysis followed by comparative analysis, surveyed regions, expert interviews and relating document analysis
- Research approach: qualitative
- Research types: analytical, qualitative, exploratory, practice-based and conceptual.

As a result, this paper is regarded to contribute to inductive research streams, and can be found within the philosophical perspective of constructivism and interpretivism of the researcher (ref. to Creswell, 2013).

In sum, in order to construct a practice-driven model that is intended to be used in the future, a mixed approach is at the heart of the research, where the researcher is obliged to compare, balance out and pick up the right approaches. Since this paper is a result of the applied research project, it heralds rather high applicability and transferability potential, which, indeed, can be underpinned through a systemic combination of methods, tools and approaches in the research methodology journey, as discussed above.

4. Designing the transnational RIS3 observatory model and positioning it within the current discourse

As introduced, cluster theories are used to build up the structure of the presented transnational RIS3 Observatory Model. Having the used definition of cluster by Porter (1998) and earlier mentioned recommendation to unify priority axis in mind, it is possible to align several clusters within a NUTS-2 region according to the individually chosen priority axis. As an example, the region of Mecklenburg Western-Pomerania has identified six priority axes in its RIS3 document for 2014 - 2020, so we would introduce six so called "RIS3 cluster" for it according to our model, which of course interact between each other as well on a sub-national level.

Based on the implemented qualitative analysis (case studies) in line with the "SMART_watch" project and 10 NUTS-2 regions analysed, several similarities of RIS3 implementation were indicated, e.g. in chosen priority axes, monitoring systems, observatory structures, etc. A comparison of the chosen regional priorities led to the conclusion that NUTS-2 regions have very similar axis and themes that partly only differ in their labels (e.g. "Health & Life Sciences" vs. "Life Sciences"). For the upcoming funding period, an early recommendation to be made is an unification of priority axis to create more common particular fields in the smart specialisation implementation. For the model development, this unification is one of the main requirements to create sufficient clusters between European NUTS-2 regions.

The structure of the conducted model is built around a main actor as managing body – the Transnational RIS3 observatory. It could be interpreted as managing position for a certain number of regional RIS3 clusters. This kind of cluster management structure was indicated as "cluster of clusters" by Keller (1996). Portnoy (2004) emphasises such structure as managing a cluster of classic. However, a thematic managing body on a trans-national level to coordinate the regional RIS3 clusters.

The conducted model is considering any individual regional preferences in terms of Smart Specialisation. Therefore, every region is still developing an own strategy, integrating a detailed regional SWOT-analysis (or similar tools) to derive priorities like it is recommended by the European Commission (Foray et. al., 2012) and includes the involvement of regional stakeholders as vertical and horizontal network (Roman et. al., 2018).

In addition, as a result from the case study analysis, the model proposes to announce one representative / institution responsible for one specific priority axis. Some regions already follow this recommendation, but for a sufficient model implementation it is necessary to have such experts acting as contact and decision maker for each priority. The Trans-national RIS3 observatory body is the key element in conducted model structure and could be understood as a cluster organisation or platform. Such institutions shall be implemented to improve innovation and competitiveness of a specific cluster (Christensen et. al., 2012). From the authors' point of view, a Trans-national RIS3 observatory needs at least the mentioned three main bodies below:

Management Committee:

Implementing a Management Board is a well recommended aspect for strategic leadership and competitiveness (Elenkov et. al., 2005) and already included in all analysed RIS3 documents as case studies. The Management Committee should consist of the representatives from each region under the observatory.

The main task for this committee is the administrative management of all actions in relation with the respective priority in their regions. In addition, the committee is responsible for coordinating the Smart Specialisation implementation activities in a cross-regional cooperative way. Furthermore, the on-gong implementation of the monitoring system is one of the key actions to be done by this committee. This includes to indicate future trends and obstacles for the respective thematic priority.

EU – cross communication body:

The second body is mainly responsible for the external communication of results, action plans, events, success stories etc. Through the individual implementation of regional strategies, European NUTS-2 regions tend to act like islands in terms of RIS3. To avoid such development, external (and internal) communication and networking activities are required. Therefore, a precise networking schedule with other trans-national observatories has to be developed and implemented by the communication body.

Furthermore, this body is the interlink to European level and responsible to exchange all necessary information, trends and results. Therefore, the cross-communication body should consist at least one representative from European level to ensure fast communication channels and communication managers from the regional level.

Thematic experts / stakeholder:

As mentioned earlier, the involvement of regional stakeholders is an important requirement to develop sophisticating strategies. This includes academics as well to foster regional development (Risár et. al., 2018). Though, the integration of thematic experts should be an on-going process in Smart Specialisation implementation. Therefore, the third body play a consulting role for the Managing Committee.

Another structural body to be included to the model is the management on national level. Analysing the case studies concludes only partly existence of national strategies. Therefore, this body is seen as optional and should focus on the support and coordination of all regions in the country.

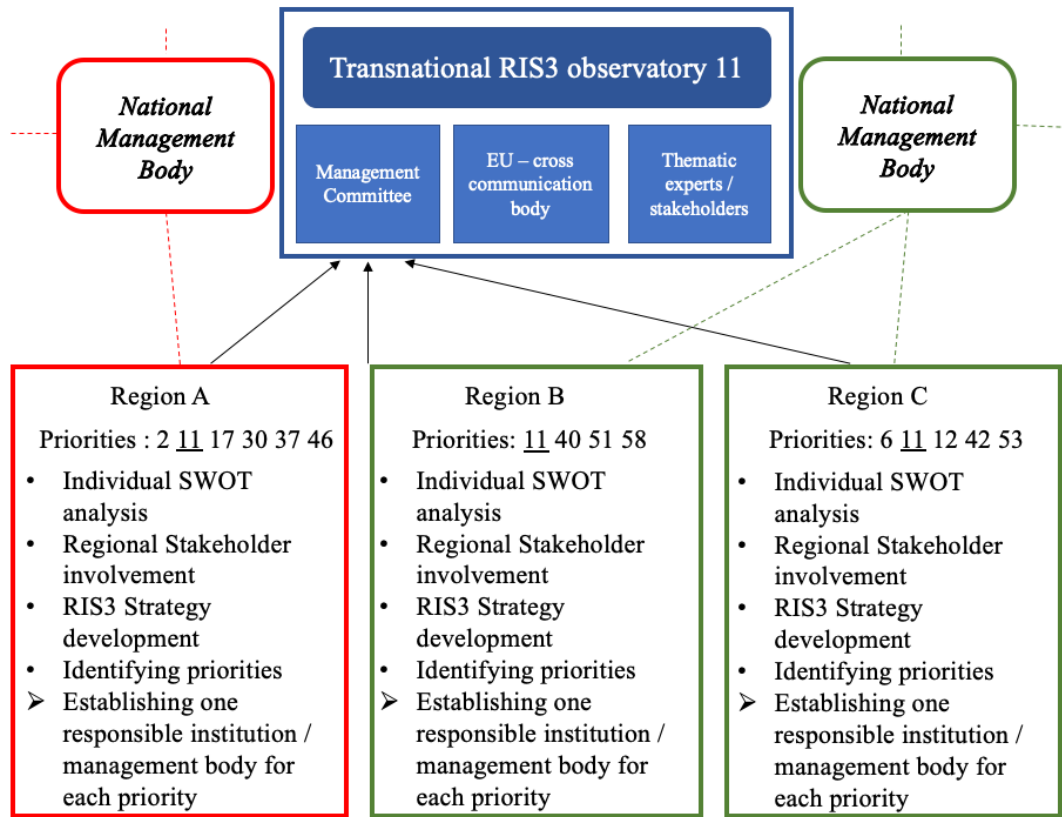
For the model illustration in Figure 1, we assume a showcase having three regions from two different European countries (red and green frames). As mentioned, another assumption is a unification of priority axis which creates a defined set to choose from – illustrated by numbers. In this case, all three regions have chosen priority No. 11 as one of their smart specialisation axes as result on individual and regional analysis between several others. Thus, the regions are part of the cluster managed by the Transnational RIS3 observatory No. 11 with all mentioned characteristics and their representative for priority No. 11 will enter the Management Committee.


Figure 1: Transnational RIS3 Observatory Model including interlinks between structural bodies

Source: Compiled by the author

As shortly mentioned, the Transnational RIS3 observatories need to build up a network among each other via the communication body to connect all acting levels from regional to European. On European level, the responsible directorate need to be included to the overall Smart Specialisation implementation, namely European Commission, S3 platform and Joint Research Centre. Figure 2 illustrates possible connections between the actors, having three observatories as examples. This structure is necessary for regular information exchange as well as on-going monitoring on European level, including an evaluation of funding programmes and their results in terms of the RIS3 approach.

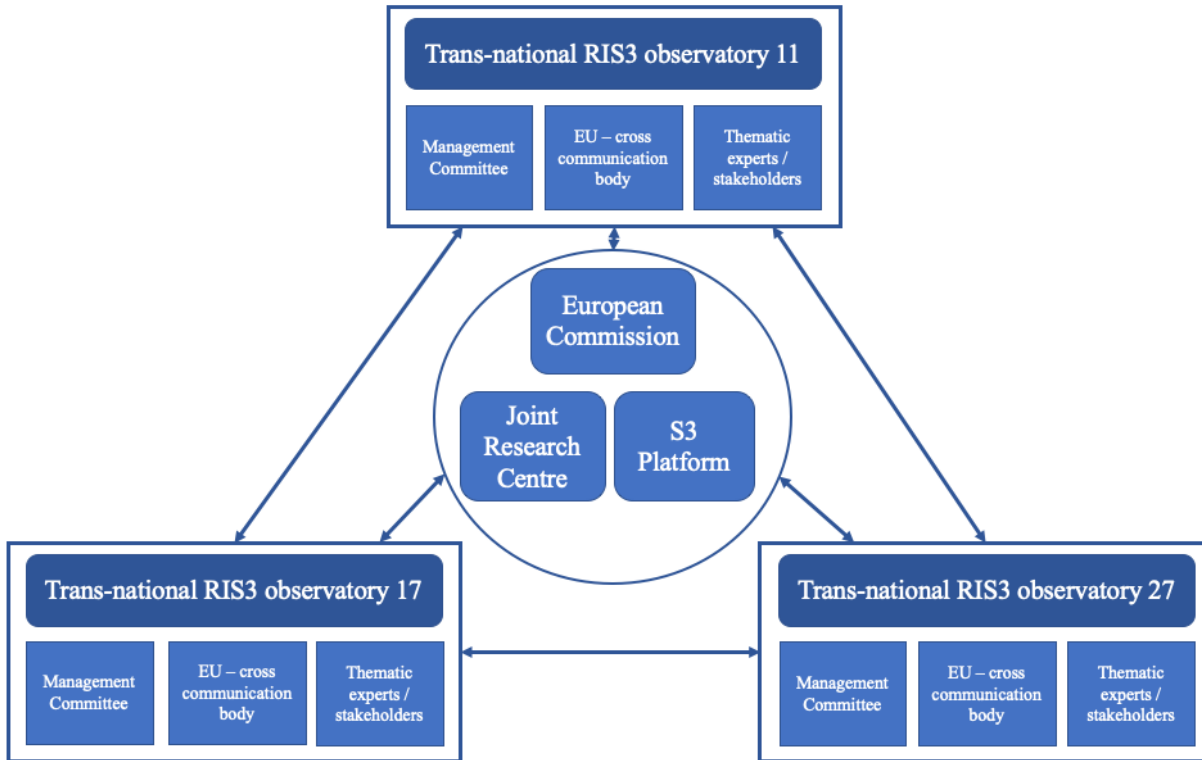

Figure 2: Classification and interlinks of Transnational RIS3 Observatories on European level

Source: Compiled by the author

To make sure a well-balanced number of regions within the observatories and avoid large-scale observatories, a geographical limitation could be implemented, also socio-economic characteristics could be reasonable allocation of the observatories (Pavone et. al., 2020). Another option is to implement classifications following the European funding areas, e.g. Central Europe or Baltic Sea Region. This ensures that the regions may have several similarities and their different circumstances are not too high obstacles for joint activities.

Monitoring System for the Trans-national RIS3 observatory

The proposed monitoring characteristics in the model is not part of the structure-oriented Figures 1 and 2. Following the earlier introduced approach to rely on cluster theories, the monitoring of a Trans-national RIS3 observatory itself should follow the Cluster policy cycle of the European Commission containing three stages: Analysis, Strategy and Action (European Commission, 2016a). This three-step approach is already implemented in several regional strategies and has been proven as sufficient process.

As key obstacle for a useful and sufficient monitoring system is the selection of indicators. In the case studies of the "SMART_watch" project, the author proposed a methodology to choose a set of indicators to measure Smart Specialisation performances of a limited number of NUTS-2 regions. In the presented model, the monitoring responsibilities are transferred completely to the Transnational RIS3 Observatory Model and its bodies. This allows a comprehensive comparison of the individual performances of the RIS3 implementation of each region under the observatories. As mentioned earlier, the national body is seen as optional unit so is the national

monitoring system. If countries decide to set up individual national monitoring system as well, the requirement to have a comparable system across all European regions would fade away, which is one of the main problems to overcome in the model, therefore, individual (national) monitoring systems are not recommended.

Besides the recommendation and assumption to unify the priority axis to choose from, a more unified approach in choosing the right indicators for Smart Specialisation performance measuring is the second key recommendation in line with the. Structural model. In the current implementation processes, each region chooses indicators by itself, which creates biased performance comparisons among regions. To avoid this bias, the selection of indicators should not be initiated on regional but on the European level in dialogue with the Transnational RIS3 observatories. In this sphere, indicators have to be distinguished with focus on Smart Specialisation performance measuring that serve as basis for all European regions monitoring – Set of Indicators for RIS3. This ensures high comparability among all regions and avoid biased individual monitoring activities. As the best practices have shown, at least context, output and result indicators have to be implemented in the set (European Commission, 2020).

As Figure 3 illustrates, the chosen set of indicators needs to be expanded by another category of indicators which are chosen specifically for the respective priority axis. As explained, the Transnational RIS3 observatories are set up in line with the thematic axis and though the observatories are in charge to select sufficient indicators to measure regional performances in the thematic fields – Priority specific indicators.

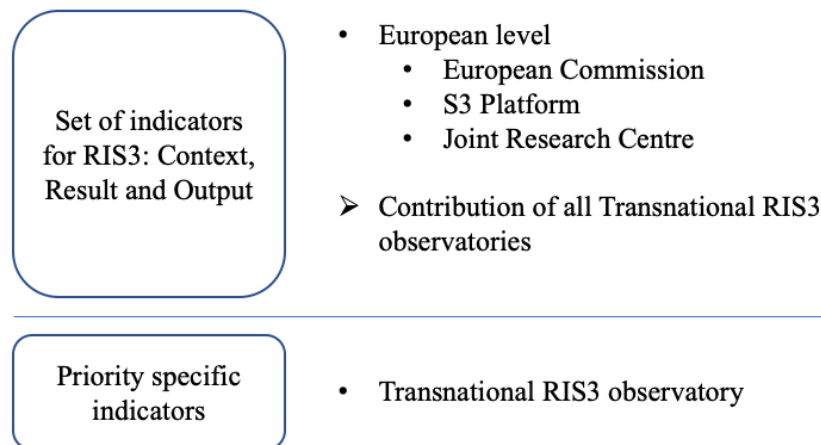

Figure 3: Monitoring indicators and responsibilities

Source: Compiled by the author

To finalise the set-up of proposed monitoring system in line with the Transnational RIS3 Observatory Model the regional capabilities need to be considered. At this point, the model considers the heterogeneity of European NUTS-2 regions. For each indicator of both categories, base values and target values have to be defined according to the region's economic, innovative and competitive circumstances and potentials. In line with this set-up, the data sources of indicator values have to be clarified to avoid any missing data in the on-going implementation and monitoring processes.

5. Conclusions

The objective of this research paper was to examine, how a functional model can be implemented across the EU on all necessary levels to enable Smart Specialisation monitoring for RIS3 implementation. The conducted Transnational RIS3 Observatory Model as a tool introduces a sufficient structure that needs to be implemented and integrates main actors on regional, national and European level. Case study analyses were used building upon 10 European NUTS-2 regions' cases. In addition, the research delivers a macro-region and transferable concept of RIS3 policy governance that sets up the model structure as well as provides a portfolio of opportunities to foster collaboration across Europe on Smart Specialisation implementation, its evaluation and monitoring. The involvement of actors from the European level was introduced in line with the existing network participation in all Transnational RIS3 observatories interacting between each other and representatives of the European Commission, the Joint Research Centre and the S3 Platform as main contact points for Smart Specialisation.

Besides the structural description, the characteristics of the set of indicators as a key factor driving monitoring were described in detail including the responsible bodies for setting up and monitoring. At this point, the model pays tribute to the heterogeneity in terms of RIS3 monitoring discourse of European regions by providing room of action for individual optimisation. In addition, the model postulates the institutional responsibility for setting up regional target values for each indicator of the two categories: Set of Indicators for RIS3 and Priority specific indicators. As a result, this ensures a better evaluation of Smart Specialisation implementation success and a more efficient usage of regional capabilities.

The proposed model can be implemented initially in the current Smart Specialisation process supported by the online tool as proposed by Panori et. al. (2017). Required bodies and institutions are mainly established already across the regions. Therefore, a change to the proposed model can pushed fast and with low costs. It requires only resources regarding capacity reallocation and perspective change. Though, as next step, a feasibility study of the model with several NUTS-2 regions participating is recommended to test the structure and monitoring system to foster the regional RIS3 implementation performances.

Abstract. This study aims to analyze the effect of tax knowledge, tax complexity, and tax justice on taxpayers' trust and tax compliance as well as the differences in tax compliance levels in South Sumatra. The research is explanatory and takes a quantitative approach. The method of data collection used a questionnaire containing the variables and documentation outlined by the study. The research questions were tested using hypothetical compliance scenarios, with 900 registered individual taxpayers from five major cities in South Sumatra as participants. The researchers used confirmatory factor analysis (CFA) with the structural equation modeling (SEM) approach. Results of the research show that (1) tax knowledge has no effect on taxpayers' trust, (2) tax complexity has no effect on taxpayers' trust, (3) tax justice has an effect on taxpayers' trust, (4) tax knowledge has no effect on tax compliance, (5) tax complexity has no effect on tax compliance, (6) tax justice has an effect on tax compliance, (7) taxpayers' trust has an effect on tax compliance, and (8) there were differences in the level of tax compliance after the implementation of the SMS blast program.

1. Introduction

The low level of tax compliance in Indonesia is as crucial as it is in other countries. According to OECD (2017), the Indonesian tax ratio reached 11.8% in 2015. This is lower than other Southeast Asian countries, such as Malaysia (15.3%), Singapore (13.6%) and the Philippines (17%). This is further explained by Araki and Claus (2014), who classified Indonesia into group of other countries with low levels of tax compliance, such as Cambodia and India. This is significant because Indonesia had the 16th highest gross domestic product (GDP) in 2019 (World Bank, 2019) and is one of the six non-OECD countries with largest economies, along with Brazil,

Russia, India, China, and South Africa (BRICS) (OECD, 2008). To increase the tax ratio and the nation's income, the Indonesian government must improve tax compliance by exploring the determinants of individual taxpayers' compliance. Chau and Leung (2009) state that "tax compliance is growing international concerns for tax authorities and public policy makers as tax evasion seriously threatens the capacity of government to raise public revenue" (p. 34). Tax compliance is also a main topic in economic psychology. This issue has been analyzed from different perspectives that focus on several aspects of taxpayer behavior. Attitude is measured, social norms are applied, and common theories are explored when people declare their annual tax return (Kirchler, 2007). In Indonesia's case, the number of individual taxpayers dominates all registered taxpayers, at around 90% of the total. However, their share in terms of tax contribution is still low.

Previous studies have tried to explain the arguments concerning factors that influence tax compliance, but it is unclear whether these studies contribute to the tax system in developing countries because, in some developing countries, local authorities tend to have less power and public trust due to political, social, and economic instability, leading to low tax compliance. On the contrary, some developed countries have demonstrated stronger tax regulation and higher trust, which generate high tax compliance (Bird, Martinez-Vazquez, and Torgler, 2008). The present research names tax compliance as the second endogenous latent variable and applies the theory of planned behavior (TPB) (Ajzen, 1991) to its hypothesis. This research also uses a combination of concepts revealed by Bărbuţă-Mişu (2011) and Alm (2018), who divided factors influencing tax compliance into two groups, namely, economic and noneconomic. This study utilizes several applied theories based on the review of the related literature to analyze the other identified variables: (1) the first endogenous latent variable (taxpayers' trust) and (2) the exogenous latent variables (tax knowledge, tax complexity, and tax justice). This study aims to analyze the effect of tax knowledge, tax complexity, and tax justice on taxpayers' trust and tax compliance as well as the differences in tax-compliance levels in South Sumatra. The researchers selected this region because no tax compliance–related studies have examined it and the rate of individual taxpayers' compliance is still low. Additionally, it may become the benchmark for other regions in Indonesia to increase their tax compliance.

The novelty of this research is the categorization of registered individual taxpayers into two groups: (1) compliant taxpayers (CT) who regularly pay taxes and file an annual tax return and (2) noncompliant taxpayers (NCT). CT consists of paying-filing taxpayers (PFT). NCT is divided into three subgroups: paying-nonfiling taxpayers (PNFT), filing-nonpaying taxpayers (FNPT), and nonpaying-nonfiling taxpayers (NPNFT). Furthermore, none of the previous studies has focused on the differences in tax-compliance levels among individual taxpayers categorized as noncompliant, before and after the implementation of a certain tax scheme. Hence, this study employs a short message service (SMS) blast to test individual taxpayers' compliance levels in South Sumatra. This study contributes to improving tax compliance in South Sumatra and expanding the Indonesian tax base because the focus is shifted from increased tax revenue to new tax revenue generated from NPNFT.

The rest of this paper is organized as follows: a survey of related literature and the development of hypotheses are provided in Section 2. Section 3 describes the research objective and methodology employed in this paper. The results and discussion are reported in Section 4, and Section 5 concludes the paper.

2. Literature review

2.1 Effect of tax knowledge on taxpayers' trust

Fahr and Djawadi (2013) explain that tax compliance is considered high in a tax system with low power of authority when complete transparency concerning public expenses is provided and when taxpayers are given options in utilizing the taxes they paid. Fahr and Djawadi (2013) further demonstrate that strong tax authority, reflected from high tax audits, does not guarantee the improvement of tax compliance, even when taxpayers' trust is increased. However, with adequate tax knowledge, taxpayers are more likely to trust the tax authorities, ultimately leading to tax compliance. Palil, Akir, and Ahmad (2013) found that tax compliance is lower among people with less tax education and knowledge. In other words, with proper tax knowledge, taxpayers will be able to decide whether they trust the tax authorities. This emergence of trust will eventually determine the taxpayer's decision to comply with tax obligation. Gitaru (2017) argues that electronic education of taxpayers, print media, taxpayers' education, and the stakeholders' engagement influence tax compliance among small–medium enterprises (SMEs) in Nairobi, Kenya. The sensitivity of stakeholders is positively related to taxpayers' education in calculating correct tax liabilities (Susanto, Pirzada, and Adrianne, 2019) Overall, education influences taxpayers' trust in the tax authorities. This will lead to taxpayers' willingness in paying their taxes voluntarily. Considering these studies, the first hypothesis predicts:

H1: Tax knowledge influences taxpayers' trust in South Sumatra.

2.2 Effect of tax complexity on taxpayers' trust

Forest and Sheffrin (2002) state that tax complexity influences taxpayers' trust on tax authorities. Budak and James (2018), who believe that complexity has a significant part in improving the costs of tax compliance, support Forest and Sheffrin's idea. Complexity particularly affects compliance related to complex legislation because complicated legislation makes it costly for taxpayers to comply with their obligations. Saad (2014) proves that tax complexity influences tax compliance. It is caused by the huge amount of paperwork to be completed by taxpayers in New Zealand in complying with their tax obligations. Gambo, Mas'ud, Nasidi, and Oyewole (2014), who investigated tax compliance in 44 African countries, suggest that tax complexity negatively affects taxpayers' trust toward tax authorities. Brainyyah and Rusydi (2016) conducted a study on SME entrepreneurs in Malang, East Java, and discovered that tax complexity has significant and negative correlations with tax compliance behavior. This study indicates that the more complex a tax regulation is, the more ignorant the taxpayers will be. Furthermore, Mahangila (2017), who studied 75 SME entrepreneurs in Dar es Salaam, Tanzania, suggests that tax complexity has an impact on taxpayers' trust toward tax authorities. Based on these studies, the second hypothesis is proposed:

H2: Tax complexity influences taxpayers' trust in South Sumatra.

2.3 Effect of tax justice on taxpayers' trust

Benk, Budak, and Cakmak (2012) identify six dimensions of tax fairness, namely, general fairness, tax share and tax burden of middle-income earners, exchange with the government, tax-rate structure, special provisions, and tax system equality and inequality. Benk, Budak, and Cakmak, (2012) further conclude that tax fairness has an impact on taxpayers' trust in Turkey. Gberegbe, Idornigie, and Nkanbia-Davis (2015) explain that taxpayers' perceptions toward tax justice applied by tax authorities affects taxpayers' trust. Faizal and Palil (2015), who

studied individual taxpayers in Malaysia, reveal that tax fairness perception influences individual taxpayers' trust. This illustrates that the more fairness is perceived by taxpayers, the higher the level of taxpayers' trust will be. Belay and Viswanadham (2016) researched several cities in Amhara Regional State, Ethiopia, and discovered that perceptions of tax fairness have an impact on individual taxpayers' trust. They further explain that there are concerns regarding several aspects of the country's income tax system that need to be improved. Based on the preceding discussions, the third hypothesis is formulated:

H3: Tax justice influences taxpayers' trust in South Sumatra.

2.4 Effect of tax knowledge on tax compliance

Newman and Nokhu (2018), who studied several SMEs in Zimbabwe, identified that these SMEs possess basic tax knowledge but no deeper understanding concerning the differences between presumptive taxation and income-based taxation. However, this result insignificantly affects their noncompliance, meaning tax knowledge influences tax compliance. Newman and Nokhu (2018) further explain that to positively impact tax compliance, tax tariff and corruption issues must be taken seriously. Bernard, Memba, and Oluoch (2018) conducted a study on investors in export processing zones (EPZs) in Kenya and advised that tax knowledge has a close relationship with taxpayers' ability to understand tax rules and regulations as well as their willingness to comply with them. A company with employees trained in taxation matters is likely to voluntarily fulfill their tax obligations based on applied tax rules and regulations. Due to these findings, the fourth hypothesis is as follows:

H4: Tax knowledge influences tax compliance in South Sumatra.

2.5 Effect of tax complexity on tax compliance

Krause (2000) proves that uncertainty, ignorance, and burdensome documentation requirements prevent some taxpayers from taking advantage of legitimate tax rebates and deductions, while others find opportunities to avoid taxes in such ambiguous provisions. Complexity has undermined the ability of Internal Revenue Service (IRS) ability to distinguish between intended tax avoidance and honest misinterpretation regarding tax codes and planning Rudyanto and Pirzada, 2020). McKerchar (2005), who surveyed tax agents in Australia, discovered that these agents disagree with the increased complexity of tax laws Richardson (2006), in his research of 45 countries, suggests that complexity is the main driver of noncompliance besides education, source of income, justice, and tax morale. His findings are consistent with that of Cox and Eger III (2006) who believe that complexity leads to misdirection of objectives of the tax agency an increased opportunity for noncompliance. Similarly, Kirchler, Niemirowski, and Wearing (2006) argue that the possibility of compliance is higher when tax laws are considered less complex. These thoughts lead to the fifth hypothesis:

H5: Tax complexity influences tax compliance in South Sumatra.

2.6 Effect of tax justice on tax compliance

Musthapha (2010) performed a study in Nigeria and believes that two out of five dimensions of tax justice, namely, exchange with government and special provisions, affect tax compliance. Similarly, Mukasa (2011) states that an increase in tax justice will lead to the improvement of tax compliance. Gberegbe and Umoren (2017) claim that distributive justice, procedural justice, retributive justice, and perceptions of tax justice affect individual taxpayers' compliance in Rivers State, Nigeria. Olaoye, Ayeni-Agbaje, and Alaran-Ajewole (2017) studied block

molding firms in Ekiti Province, Nigeria, and point out that tax knowledge has a higher tendency to promote tax compliance than tax administration. Furthermore, Sidik, Zandi, and Ruhoma (2019), who researched individual taxpayers in Libya, state that tax justice influences tax compliance. They believe that public perception of fairness depends on how they perceive tax system to be fair or not. These findings lead to the next hypothesis:

H6: Tax justice influences tax compliance in South Sumatra.

2.7 Effect of taxpayers' trust on tax compliance

Wahl, Kastlunger, and Kirchler (2010) discovered that power and trust have a positive impact on tax payment. Dependable and reliable tax authorities could increase tax compliance voluntarily or by law enforcement. Kogler et al. (2013) and Muehlbacher, Kirchler, and Schwarzenberger (2011) revealed similar findings, suggesting that trust in tax authorities increases voluntary tax compliance. Additionally, Bornman (2015) proposes that perceptions of fairness, treatment of authorities, norms and attitudes, and subjective tax knowledge are the main factors determining trust in tax authorities. However, several studies use limited descriptors when measuring this relationship. Bornman (2015) further suggests that standard survey instrument need to be developed to measure this perception. Based on these studies, the seventh hypothesis is proposed:

H7: Taxpayers' trust influences tax compliance in South Sumatra.

2.8 Differences in taxpayers' compliance levels

Najah (2008) and Husaini, Pirzada, and Saiful (2020) argues that there is no difference in corporate taxpayers' compliance levels before and after the enactment of a tax audit. Komalasari and Nasih (2010) tested the influence of taxpayers' reported income toward the level of their compliance and found that there was no significant difference in the level of taxpayer compliance whether a 15% or 30% tax tariff was imposed. Fajarwati, Kertahadi, and Kurniawan (2004) conducted a study in several tax offices in Malang Raya, East Java and found that there was a significant difference between the degrees of tax compliance before and after the implementation of a tax modernization program. These studies explain the differences in taxpayers' compliance levels before and after the implementation of tax-related schemes. Accordingly, this study applies a tax program called an SMS blast to test the compliance levels in South Sumatra. This leads to the eighth hypothesis:

H8: There will be differences in taxpayers' compliance levels before and after the implementation of the SMS blast program.

3. Research objective and methodology

3.1 Design, variables, measurements, and sources

This research is explanatory with a quantitative approach. Three main objectives were achieved through this study. The first objective is a description of taxpayers' trust as the first endogenous latent variable (Y1); tax compliance as the second endogenous latent variable (Y2); and tax knowledge (X1), tax complexity (X2), and tax justice (X3) as exogenous latent variables (X). The second is the effect of the exogenous latent variables on Y1 and Y2 and the influence of Y1 on Y2. The third objective is to identify the differences in tax compliance among individual taxpayers who fall into the noncompliant category consisting of PNFTs, NPFTs, and NPNFTs.

3.2 Population, sample, data collection, and method of analysis

The population of this study includes all individual income taxpayers registered in tax offices in the five provinces of South Sumatra, including Jambi, South Sumatra, Bengkulu, Lampung, and the Bangka Belitung Islands (see Table 1). The study used representative sampling to reflect the characteristics of the larger population. Research questions were tested using hypothetical compliance scenarios with 900 registered individual taxpayers from five major cities in South Sumatra as participants. The determination of the sampling method was based on the idea that "the number of samples in the SEM study was 5–10 times the number of indicators" (Hair et al., 2014, p. 615). In this study, the multiplier factor of 10 is used to provide a more detailed and accurate picture of the five variables studied. With a total of 78 indicators, the total sample was 780 people. The sample size was increased to 900 people to anticipate insufficient or incomplete data. In practice, out of five tax offices, 180 samples of individual taxpayers were determined in each province and divided into two groups, consisting of 90 employees and 90 nonemployees. The characteristics of the respondents include gender, age, education, type of employment, and duration as taxpayer (see Table 2).

Table 1. Research Population

No.	Provinces	Registered Individual Taxpayers		Subtotal
		Employees	Nonemployees	
1	Jambi	33,286	17,823	51,109
2	South Sumatra	58,976	29,632	88,608
3	Bengkulu	31,717	15,898	47,615
4	Lampung	52,294	27,118	79,412
5	Bangka Belitung Islands	13,265	7,096	20,361
	Total	189,538	97,567	287,105

Source: Indonesian Directorate General of Taxes (2018)

Table 2. Characteristics of Research Respondents

Characteristics	Items	Number of respondents	Percentage (%)
Gender	Male	547	70.13
	Female	233	29.87
Age	17–25 years	3	1.18
	26–35 years	72	28.23
	36–45 years	40	15.67
	46–55 years	140	54.90
Education	High school graduate	78	10.00
	Tertiary education (Grade 1–3)	141	18.08
	Bachelor' degree	492	63.08
	Master's degree	53	6.79
	Doctoral degree	16	2.05

Type of employment	Employee a. Civil servant	195	25.00
	b. Private	195	25.00
	Nonemployee	390	50.00
Duration as taxpayer	1–5 years	139	15.29
	5–10 years	434	52.55
	> 10 years	207	32.16

Registered taxpayers in South Sumatra are dominated by men (70.13%), age 46–55 (54.90%) with undergraduate qualifications (63.08%).

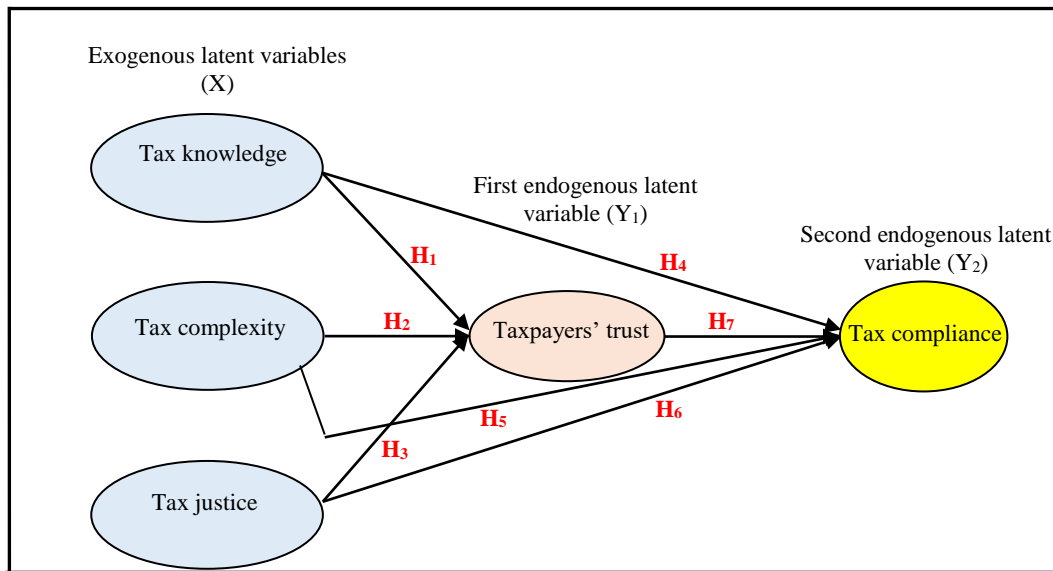
Data collection used a questionnaire containing the latent variables and documentation. The data was then processed using a Likert scale. of the data was analyzed using a quantitative approach to test the effect of the exogenous latent variables (X1, X2, X3) on the first endogenous latent variable (Y1) and the second endogenous latent variable (Y2) and to test the effect of Y1 on Y2. The quantitative analysis also examines the differences in compliance levels of noncompliant taxpayers (NCT), who are divided into three subgroups: paying-nonfiling taxpayers (PNFT), filing-nonpaying taxpayers (FNPT), and nonpaying-nonfiling taxpayers (NPNFT). The analysis method uses confirmatory factor analysis (CFA) with the structural equation modeling (SEM) approach. A statistical program called a linear structural relationship (LISREL) was applied to estimate SEM. Other statistical tools included statistical package for the social sciences (SPSS) to perform descriptive statistics, a validity test, a reliability test, and a Z-test. Based on the analyses of previous studies related to tax compliance, trust, tax knowledge, tax complexity, and tax justice, a research framework as seen in Figure 1 was developed.


Figure 1. Conceptual Framework

Sources: Tax compliance: Alm (2018); Bărbuţă-Mişu (2011); Taxpayers' trust: Bornman (2015); Tax knowledge: Asrinanda & Diantimala (2018); Istiqamah et al. (2018); Saad (2014); Tax complexity: AICPA (1992); Cox & Eger III (2006); McCaffery (1990); Pau et al. (2007); Richardson & Sawyer (1998); Saw & Sawyer (2010); Tax justice: Colquitt (2001); Farrar et al. (2013); Gberegbe et al. (2015); Kirchler et al. (2014)

3.3 Validity and reliability test

The validity test is a measure of the accuracy of the instruments used in the study (Linn and Grondlund, 2000; Stewart, 2009), while a reliability test shows the number of measurement errors in a test (Tavakol and Dennick, 2011, p. 53). Reliability and validity are concepts used to evaluate the quality of research. They indicate how well a method, technique, or test measure something. This study employs these two tests to measure the accuracy and consistency of questionnaire items in explaining indicators of each research variable. Hair, Black, Babin and Anderson (2010) suggest that an item is considered valid if it has a factor loading value > 0.6, while Nunnally and Bernstein (1994) point out that data is reliable if Cronbach's alpha value is > 0.7. The test results are shown in Table 3.

Table 3. Results of Validity and Reliability Test

No.	Research variables	AVE value	Result	Cronbach's alpha	Result
1	Tax compliance	0.76	Valid	0.793	Reliable
2	Taxpayers' trust	0.73	Valid	0.746	Reliable
3	Tax knowledge	0.76	Valid	0.711	Reliable
4	Tax complexity	0.74	Valid	0.737	Reliable
5	Tax justice	0.73	Valid	0.752	Reliable

Research variables with a value of AVE > 0.6 indicate there is sufficient convergence for each variable. Cronbach's alpha value is greater than 0.7, meaning all five variables are reliable for further processing.

4. Results and discussion

4.1 Descriptive statistics

Table 4 shows that the number of respondents is 780 people and tax compliance had an average value of 298.32 (the lowest value). This indicates that, compared to other variables, tax compliance has the lowest preference among respondents. Taxpayers' trust had an average value of 309.71. Tax knowledge had an average value of 339.50. Tax complexity had an average value of 343.46, and tax justice had an average value of 344.29 (the highest value).

Table 4. Descriptive Statistics Results

No.	Research variables	n	Maximum	Minimum	Mean
1	Tax compliance	780	615	19	298.32
2	Taxpayers' trust	780	627	9	309.71
3	Tax knowledge	780	688	9	339.50
4	Tax complexity	780	689	3	343.46
5	Tax justice	780	694	6	344.29

The amount of data to be studied is 780 samples. The tax compliance variable has a mean value of 298.32, meaning an average of 298 individual taxpayers in South Sumatra show preference for tax compliance.

4.2 Confirmatory factor analysis

This study utilizes confirmatory factor analysis (CFA) with the SEM approach to analyze the effect of the exogenous latent variables on Y1 and Y2 and the influence of Y1 on Y2. The analysis tool uses a computer-based application program, namely, a linear structural relationship (LISREL). The stages of CFA are as follows (Hair et al., 2010, p. 628):

4.2.1 Development of theory-based model

The research model was based on the theory of planned behavior (TPB) (Ajzen, 1991) and a combination of concepts by Bărbuţă-Mişu (2011) and Alm (2018), who place factors influencing tax compliance into two groups, namely, economic and noneconomic. TPB suggests that a person's motivation to perform a certain behavior is also influenced by the individual's perception of how easy or difficult the behavior is. This justifies the need to expand the model to understand other factors that influence tax compliance. This theory-based model consists of five variables, including taxpayers' trust as the first endogenous latent variable (Y1), tax compliance as the second endogenous latent variable (Y2), and tax knowledge, tax complexity and tax justice as exogenous latent variables (X1–X3). The model developed in this study is illustrated in Figure 1.

4.2.2 Path diagram development

The path diagram aims to predict the causal relationship between predetermined variables and tests the contribution of each exogenous latent variable to Y1 and Y2 and the contribution of Y1 to Y2 (the test result is not presented in this paper).

4.2.3 Conversion of path diagram into equations

The next step after the theoretical model is developed and depicted in a path diagram is to convert the model into a series of equations, which include:

- A structural equation, which aims to determine the causal relationship between various variables. This study produces a structural equation as follows:
  Tax Compliance (TCO) = Taxpayers' Trust (TPT) + Tax Knowledge (TK)+ Tax Complexity (TC) + Tax Justice (TJ) + error
- The measurement model equation, which only involves the indicators of the variable gauges. The measurement model uses the equation $x = \lambda\xi + e$

4.2.4 Selection of input matrix and estimation technique

The input matrix is used to test the causality between variables. The input matrix used in this study is the covariance matrix. The estimation technique is the maximum likelihood estimation method (Hair et al., 2010, p. 631). This technique is carried out in stages by estimating the measurement model with CFA, which aims to determine the suitability of the model and the causality relationship that is built. CFA analysis in this study is carried out in two forms, namely, CFA for exogenous latent variables and for endogenous latent variables. The test results of the exogenous latent variables confirmatory factor model are shown in Table 5.

Table 5. Exogenous Latent Variables Confirmatory Factor Model Test Results

| Goodness of fit indices	Cut-off value	Results	Model evaluation
Chi-square	$\chi2$ dengan DF = 83; P: 5% = 91,273	83.731	Good
Probalility	≥ 0.05	0.066	Good
CMIN/DF	< 2.00	1.748	Good
GFI	≥ 0.90	0.911	Good
AGFI	≥ 0.90	0.929	Good
TLI	≥ 0.95	0.965	Good
CFI	≥ 0.95	0.979	Good
RMSEA	≤ 0.08	0.073	Good

The exogenous latent variable confirmatory model is feasible to be tested at the full-model stage. This is indicated by the value of the calculation results that meet the criteria of a decent model based on various parameters of the feasible model (goodness of fit indices).

Table 5 illustrates that all the parameter values obtained meet the specified cut-off value. The results of the calculation show that each of the forming indicators of each exogenous latent variable meet the criteria, indicated by the critical value (CR), which is greater than 2.58 with probability (P) less than 0.01. Conversely, there is no specific variable that influences the second endogenous latent variable (tax compliance). Therefore, a confirmatory analysis of the second endogenous latent variable is not applied in this study.

4.2.5 Structural equation modeling analysis

Structural equation modeling (SEM) consists of two types: (1) SEM with a covariance-based approach, in which the statistical tools are AMOS/LISREL, and (2) SEM with a variant/component-based approach (Chin, 1998; Fornell and Bookstein, 1982). This study employs LISREL because the sample is more than 500 people. The results of data processing for SEM analysis in the full model are presented in Figure 2.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Figure 2. SEM Model

Chi-square	= 162,22;	Probability	= 0,074;	CMIN/DF	= 1,984
GFI	= 0,886;	AGFI	= 0,877;	TLI	= 0,964
CFI	= 0,978;	RMSEA	= 0,062;	DF	= 112

Figure 2 shows that the full-model analysis meets the fit criteria. This is indicated by the value of the calculation that meets the eligibility criteria for the full model. The test results in the full-model analysis are also converted into tabular form as seen in Table 6.

Table 6. Full-Model Test Results

Goodness of fit indices	Cut-off value	Results	Model evaluation
Chi-square	χ2 dengan DF = 112; P: 5% = 168.800	162.271	Good
Probalility	≥ 0.05	0.089	Good
CMIN/DF	< 2.00	1.984	Good
GFI	≥ 0.90	0.886	Good
AGFI	≥ 0.90	0.877	Good
TLI	≥ 0.95	0.963	Good
CFI	≥ 0.95	0.978	Good
RMSEA	≤ 0.08	0.062	Good

The results of the chi-square test calculation on the full model show that the chi-square value of 162.271 is smaller than the chi-square table for 112 degrees of freedom at a significant level (ρ) 5% of 168.800.

Table 6 shows that all parameter values obtained meet the specified cut-off value. Therefore, it can be concluded that the exogenous latent variables meet the criteria for the fit model (goodness of fit indices). Based on these results, all exogenous latent variables can be processed with the full model. SEM results testing is then carried out through the calculation of full-model regression weights. The calculation results show that of the seven hypotheses tested, there are four influences with a CR value smaller than 2.58 and a P value greater than 0.01, namely, the effect of tax knowledge on taxpayers' trust, the influence of tax knowledge on tax compliance, the effect of tax complexity on taxpayers' trust, and the effect of tax complexity on tax compliance. Based on these results, these four hypotheses are rejected. In conclusion, only three of the seven hypotheses that use CFA with the SEM approach are accepted.

4.2.6 Evaluate the criteria for goodness of fit

Goodness of fit evaluation aims to assess how well the research model is being developed. One way is to test the normality of the data. The data normality test seeks to test whether the regression model has normal data distribution by using the Skewness–Kurtosis test. The values of Z-Skewness and Z-Kurtosis are shown in Table 7.

Table 7. Results of Data Normality Test

Observed values	TCO	TPT	TK	TC	TJ
Z-Skewness	-1.723	-1.837	1.542	1.976	1.612
Z-Kurtosis	1.961	-1.488	-1.863	1.265	1.070

TCO = Tax compliance; TPT = Taxpayers' trust; TK = Tax knowledge; TC = Tax complexity; TJ = Tax justice

Table 7 shows that none of the tested variables has Z-Skewness and Z-Kurtosis values smaller than -2.58 and greater than +2.58. Based on these results, it can be concluded that the data for the five research variables were normally distributed.

4.2.7 Model interpretation and modification

A good model has a small standard residual covariance value. The standard residual covariance allowed is +2.58. These results show that the standard residual covariance exceeds +2.58 in 12 factors. The 12 factors include x3 (bachelor degree), x7 (tax course), x8 (comparative tax study), x17 (self-employed), x23 (difficulty calculating taxable income), x28 (online completion of tax registration), x34 (overly long sentences), x41 (bias), x48 (appropriateness), x49 (timeliness), x53 (taxpayers' technical competency) and x65 (social norms). Based on these results, data modification of the full model is not necessary because only a few indicators exceed +2.58.

4.2.8 Hypotheses testing

Results of the research show that the first hypothesis (H1) has a critical ratio (CR) value of 2.467 < 2.58 and probability (P) of 0.018 ≥ 0.01, meaning H1 is rejected. This shows that tax knowledge has no effect on taxpayers' trust. The second hypothesis (H2) has a CR value of 2.496 < 2.58 and P of 0.013 ≥ 0.01, meaning H2 is rejected. This result shows that tax complexity has no effect on taxpayers' trust. The third hypothesis (H3) has a CR value of 2.593 ≥ 2.58 and P of 0.002 < 0.01, meaning H3 is accepted. This result shows that tax justice influences taxpayers' trust. The fourth hypothesis (H4) has a CR value of 2.521 < 2.58 and P of 0.054 ≥ 0.01, meaning H4 is rejected. This result shows that tax knowledge has no effect on tax compliance. The fifth hypothesis (H5) has a CR value of 2.368 < 2.58 and P of 0.059 ≥ 0.01, meaning H5 is rejected. This result illustrates that tax complexity has no effect on tax compliance. The sixth hypothesis (H6) has a CR value of 2.685 ≥ 2.58 and P of 0.004 < 0.01, meaning H6 is accepted. This result shows that tax justice influences tax compliance. The seventh hypothesis (H7) has a CR value of 5,727 ≥ 2,58 and P of 0.003 < 0.01, meaning H7 is accepted. This result shows that taxpayers' trust influences tax compliance.

4.3 Z-test analysis

The following is the result of differences in levels of tax compliance before and after the implementation of a short message service (SMS) blast program (see Table 8).

Table 8. Differences in Individual Tax Compliance Levels Before and After the Implementation of the SMS Blast Program

Implementation of SMS Blast				Finding
Before		After		
x	μ	x	μ	
4.31	5.62	7.09	8.08	$\overline{x} \neq \mu$

The result of the Z-test (particularly, two-way hypotheses with SPSS as a statistical tool) shows that there are differences in tax-compliance levels after the implementation of the SMS blast program. This is because the average value of the population (x) does not equal the average sample (μ). Before the implementation of the SMS blast, the tax-compliance levels of the semi-noncompliant groups of individual taxpayers, which are a combination of PNFT and NPFT, are better than that of NPNFT. After the implementation of this program, the semi-noncompliant groups became more compliant and partly turned into compliant group PFT. Additionally, the NPNFT group became more compliant and partially converted into a semi-noncompliant group. These facts show that there are differences of tax-compliance levels after the implementation of the SMS blast and that this program is effective in increasing tax compliance in South Sumatra. Therefore, the eighth hypothesis (H8) of this research is accepted.

This study finds that tax knowledge does not affect taxpayers' trust. It reveals that the availability of dimensions along with indicators that form tax knowledge are not able to influence the trust of individual taxpayers. This finding corresponds to the results of Manual and Xin (2016). However, there are some important differences between the two studies, especially regarding variable indicators. "Remembering" was the strongest indicator of the tax-knowledge variable, while "tax training" was the weakest.

This research also reveals that tax knowledge has no effect on tax compliance, similar to a study by Fauziati, Minovia, Muslim, and Nasrah (2016). Based on these two findings, this study suggests that the Indonesian tax authorities need to provide more tax training to improve taxpayers' knowledge, as explained by Anderson et al. (2001). Moreover, this study shows that tax complexity does not affect the trust of individual taxpayers. This contradicts results reported by Budak and James (2018), Forest and Sheffrin (2002), and Mahangila (2017). This study also notices that tax complexity has no effect on tax compliance. In contrast, Kirchler et al. (2006) argue that the possibililiy of taxpayers to comply is higher when tax laws are less complex.

This study reveals that "appropriateness of tax rates increase" and "difficulty in calculating taxable income" are the strongest indicators of tax complexity, while "overly long sentences" and the "use of difficult words in tax forms" are the weakest. This study also reveals that tax justice affects the trust of taxpayers. Similarly, Faizal and Palil (2015), who researched individual taxpayers in Malaysia, prove that the perception of tax justice impacts taxpayers' trust. In this research, "correction" was the most robust indicator of tax justice that affects taxpayers' confidence in taxes, while "criminal sanction" was the weakest. Additionally, tax justice was found to influence tax compliance. These findings support the results of Gilligan and Richardson (2005). Concerning the measures of the tax justice variable, this study notices that "consistency," "compatibility," 'correction," "respect," "appropriateness," and "tax penalties" are the most robust indicators of tax justice that affect tax compliance. Conversely, the "bias" indicator is the weakest. Furthermore, this study exhibits that taxpayers' trust influences tax compliance, similar to a study by Damayanti and Martono (2018), who utilize the slippery slope theory in their research. This present research also contributes to the findings of "obedience to the law," "trust in tax authority action," and "legal norms" as the strongest gauges of taxpayers' trust that affect tax compliance, while "sense of responsibility," "social norms," and "personal norms" are the weakest.

Finally, this study shows that there are differences in tax-compliance levels after the implementation of the SMS blast program. This is in line with that of Wardani and Wati (2018), who discovered significant differences before and after the enactment of tax counseling. This study also offers the categorisation of noncompliant registered individual taxpayers, consisting of paying-nonfiling taxpayers (PNFT), filing-nonpaying taxpayers (FNPT), and nonpaying-nonfiling taxpayers (NPNFT), as the novelty of this research. This is because none of the previous studies have focused on the differences in tax-compliance levels among individual taxpayers before and after the implementation of certain tax schemes.

5. Conclusions

This study has shown that tax justice and taxpayers' trust are determinants of tax compliance in South Sumatra, Indonesia. However, two other variables analyzed in this study, namely, tax knowledge and tax complexity, are proven to not influence tax compliance. The survey results also show that tax complexity has the lowest score among the variables. Therefore, tax authorities need to reassess their policies in improving tax compliance and give more attention to weak predictors of variable indicators, particularly those with the lowest scores. Additionally, this study reveals differences in tax-compliance levels after the implementation of the SMS blast program.

The findings of this study have three main implications. First, it provides a comprehensive review of prior research that had studied the influence of economic and noneconomic factors on tax compliance. Second, it determines which variables are significant predictors of the outcome variables. This relates to the four variables involved in this study as determinants of tax compliance: tax knowledge, tax complexity, tax justice, and taxpayers' trust. By understanding the determinants of tax compliance, the management team of tax authorities in South Sumatra will be able to find solutions to repair and upgrade the variables that have no effect on tax compliance. Third, this study delivers suggestions to the Indonesian tax authorities for improving tax compliance not only based on accelerated tax revenue but also new tax revenue generated from nonpaying-nonfiling taxpayers (NPNFT). The key direction for future research is a wider coverage of respondents to include registered and unregistered taxpayers as well as samples that capture the voice of the population and taxpayers in other regions. This will provide a more comprehensive explanation of the low tax compliance phenomenon in Indonesia.

Abstract. Environmental issues and social responsibility have a significant impact on the natural ecological system and economic development. Hence, it is essential to find a relative balance path between them. Previous studies have sought to explore environmental and social responsibility rather than seek solutions from a systematic perspective, and there seems to be a lack of a systematic quantitative review of periodic solutions or details. To identify multiple impacts and relationships between environmental issues and social responsibility and to illustrate emerging trends and challenges, this article proposes a scientometrics review based on 1,336 articles published from 2001 to 2020, through co-occurrence analysis and co-citation analysis together with cluster and burstiness analysis to reveal the depth and breadth of emerging research. This research demonstrates the research paradigm of environmental issues and social responsibility, extending from a single stakeholder level to a systematic strategic perspective of multiple organizations and stakeholders. The results provide researchers and practitioners with a deeper understanding of future directions and implications.

Keywords: environmental issues; social responsibility; strategy; scientometrics; review

1. Introduction

Many scholars and experts have been concerned about environmental issues for a long time and considered a strategy by many corporates (Reinhardt, 1998; Aragón-Correa et al., 2008; Tvaronavičienė & Ślusarczyk, 2019; Ji et al., 2019; Cismas et al., 2019; Khan et al., 2020; Yeganeh Kia, 2020; Mazzoni, 2020).

Meanwhile, the discussion on social responsibility has never stopped in academic circles. After one of the representative scholar Archie B. Carroll (1979) proposed a three-dimensional model and conducted the evolution of social responsibility (Archie B. Carroll, 1999), numerous scholars were exploring the relationship between social responsibility and other variables, especially from the corporate aspect. These include the strategic implication of social responsibility (McWilliams et al., 2006), social responsibility and financial performance (Cochran & Wood, 1984; McGuire et al., 1988), and Islamic religious education (Husni, 2020). In the mid of 2010s, Zeng et al. (2015) determined megaproject social responsibility (MSR) as the *social responsibility of major infrastructure projects involving the policies and practices of the stakeholders who participated through the whole project life-cycle that reflects the responsibilities for the well-being of the wider society*. An intelligent concept combined with the development trends, people's needs, social responsibility, and environmental issues.

One of the most controversial issues on infrastructure is building megaprojects. It cost many social resources and environmental resources, and they are never just a scaled-down version of small projects (Flyvbjerg, 2014). With the advent of megaprojects, a series of social and environmental problems began to emerge. Megaprojects can bring huge benefits like pulling effect on the economy, regional influence, employment, and disaster protection. However, it has some drawbacks, like environmental problems and socio-economic issues (He et al., 2019). Therefore, environmental compensation is as vital as technology, economics, culture, and supervision, and it has received significant attention from many stakeholders (Cowell, 1997). The earliest and most popular way of environmental compensation could be the compensation principle in Germany's 1970s (Peters, 1993). The essential environmental compensation connotes that the beneficiary of ecosystem service provides a conditional payment system to the environmental income service provider to achieve environmental protection through incentive or reward.

In general, environmental degradation regulations have been introduced to solve those serious problems, but the activities are still lacking in consistency and improvement. Therefore, environmental issues need to be investigated profoundly, and innovation must be required. This paper aims to illustrate the transformation of environmental issues from a corporate level to a strategic level through antecedence studies using Scientometric analysis. It will shed light on studies on the strategic field and provide managers or policymakers with a decision. To further explore the aspects involved in the research on the environmental field and social responsibility, the specific objectives of this paper are as follows; (1) To identify the development of environmental issues and social responsibility, and publish journals and articles from 2001 to 2020 using the subject category co-occurrence network. (2) To determine the holistic research state-of-art in environmental issue and social responsibility through co-occurring keywords analysis and document co-citation analysis, as well as a burstiness analysis to illustrate the abrupt changes and emerging trends of the development in the research area.

2. Literature review

There have been few studies that systematically investigated the relationship between environmental problems and social responsibility. Hence, we presented articles on environmental issues and social responsibility to discover critical findings and research trends in environmental issues and social responsibility research.

Fernández et al. (2003) reviewed the organizational culture and human resources in environmental management. From the perspective of management duty and organizational culture to establish internal stakeholders' recognition, organizational participation in environmental issues, environmental training, environmental motivation, and organizational innovation to illustrate the significance of enterprises' environmental strategy. Reinhardt & Stavins (2010) demonstrated the relationship between corporate social responsibility (CSR), business strategy, and environment. Corporates who are willing to participate in CSR, including more extensive companies, lousy performance on environmental issues, more pressure from the NGOs and the public, and final product production. CSR activities from private firms like the transparency of CSR report, CSR plans, environmental management systems, or plans related to social beneficially. For business strategy and environment, Margolis et al. (2007) suggested that profitable companies are more willing to participate in CSR activities, and in the long run, environmental protection would bring better profits to companies (Reinhardt & Stavins, 2010). Scholars intend to identify more empirical relationships in the so-called multidisciplinary. Based on a large number of studies, more in-depth studies on environment, social responsibility, and business are emerging. In a recent study, J. Liu et al. (2020) examined the relationship between ISO 14001, trade openness, and environmental pressure. The results showed no correlations between them, but the relationship varies from region to region in developing countries. An environmental management system (EMS) is a crucial factor in gaining competitiveness in the market. Bravi et al. (2020) examined how the enterprise with an EMS based on ISO 14001:2015 perceives the change caused by the revision of standards. Using a questionnaire survey in 284 Italian companies, the benefits of those corporates include risk prevention, better management of environmental activities, and a new goal to reduce energy and waste. Kolk (2016) demonstrated the social responsibility issues in international business. Over the past 50 years, three themes were commonly discussing including the green environment, ethic, rights, and responsibilities, poverty, and sustainable development. Ye et al. (2020) reviewed the studies on CSR's contribution to sustainable development, which is an excellent beginning to invest the balance between environment and sustainable development.

3. Research Methodology

Web of Science (WoS) was selected as the database of Scientometric data for research sampling. Its consistency with the core collection: Science Citation Index Expanded (SCI-EXPANDED), Social Sciences Citation Index (SSCI), Arts & Humanities Citation Index (A&HCI), and Emerging Sources Citation Index (ESCI), both sources are positively influencing and significant in academia (W. Liu et al., 2020; Zhu & Liu, 2020). Firstly, a pre-analysis was conducted with the retrieval code: *TS = (environmental management* AND social responsibility)* and refined by peer-reviewed reviews and articles to found out the synonym terms. The research rule at the end *TS = (environmental compensation OR environmental offset OR compensatory mitigation OR restoration OR environmental remediation OR environmental management) AND (social responsibility OR CSR) AND (strategy OR strategical).* We retrieved a total of 1,336 papers. Figure 1 indicates the details of the bibliography presented from 2001 to 2020.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Figure 1. The number of papers published from 2001 to 2020
Source: processed primary data

This Scientometric analysis includes author co-citation analysis, document co-citation analysis, and co-word analysis. (Chaomei, 2017). It is based on mathematical static and computing techniques (Wang et al., 2018). It is essential to understand that transient articles change the perspective and development of the scientific field. Internal and external causes are included when the style of a specific research field suddenly changed, and the field trends emerge (C. Chen, 2006). We researched the abstract, title, and keywords for selected papers from WoS and put them into Citespace software to determine theme groups. Citespace is a tool that demonstrates an excellent bibliographic visualization used to analyze the kinds of literature. It can also uniquely represent research frontiers and knowledge bases, the evolution of research frontiers, and the literature that plays a key role in the evolution process (Y. Chen et al., 2015; Fang et al., 2018; Zhao et al., 2019).

This study employs co-occurrence and co-citation analysis, specifically on the subject category of co-occurrence analysis, keyword co-occurrence analysis, document co-citation analysis, and supplementary with cluster analysis and burstiness analysis. Since the keywords of scientific literature are the basic units that reflect the knowledge component of a specific subject domain, the relationship and structure of research hotspots in the field can be indirectly mapped co-occurrence frequency, which is a significant indicator (Hsin-Ning & Pei-Chun, 2010). Co-citation analysis refers to a group of literature cited by one article or the same group of literature at the same time, the cited literature constitute the co-citation relationship, and the analysis of them is called co-citation analysis (Özmen Uysal, 2010), the cited frequency is the most comment index and draws co-cited network. Within the co-cited network, the greater the literature's centrality at key nodes, the more classic literature with significant theoretical innovation, and hot literature leading the scientific research frontier. The research frontiers and knowledge bases of environmental management and social responsibility are described as visual network forms, and their contents and structures are deeply analyzed through the above methods.

4. Results and discussion

4.1 Co-word analysis

In this section, several research themes from the WoS database on environmental issues and social responsibility have been illustrated and analyze through the co-word analysis method. Specifically, subject category co-occurrence network and keyword co-occurrence network.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

3.1.1 Subject category co-occurrence network

The subject category co-occurrence network is shown in Figure 2 below. It consisted of 57 nodes and 104 connecting lines representing the research subjects of environmental issues and social responsibilities, including 57 classes, and the character was a multidisciplinary study. The size of nodes representing the number of papers in this subject and the fuchsia color of the node's outer ring represents that subject's centrality. Figure 3 illustrates the most frequent top 20 subjects in this area, including business and economics, environmental science and ecology, management, environmental studies and sciences, science and technology, green and sustainable, engineering, social science, and the like. These represent environmental and social responsibility research, starting to extend the research field on environmental and ecology issues. It is important to pay more attention to the balance between the environment and economic development. However, the highest centrality discipline is the bridge between them: engineering and environmental (125), with the centrality of 1.29.

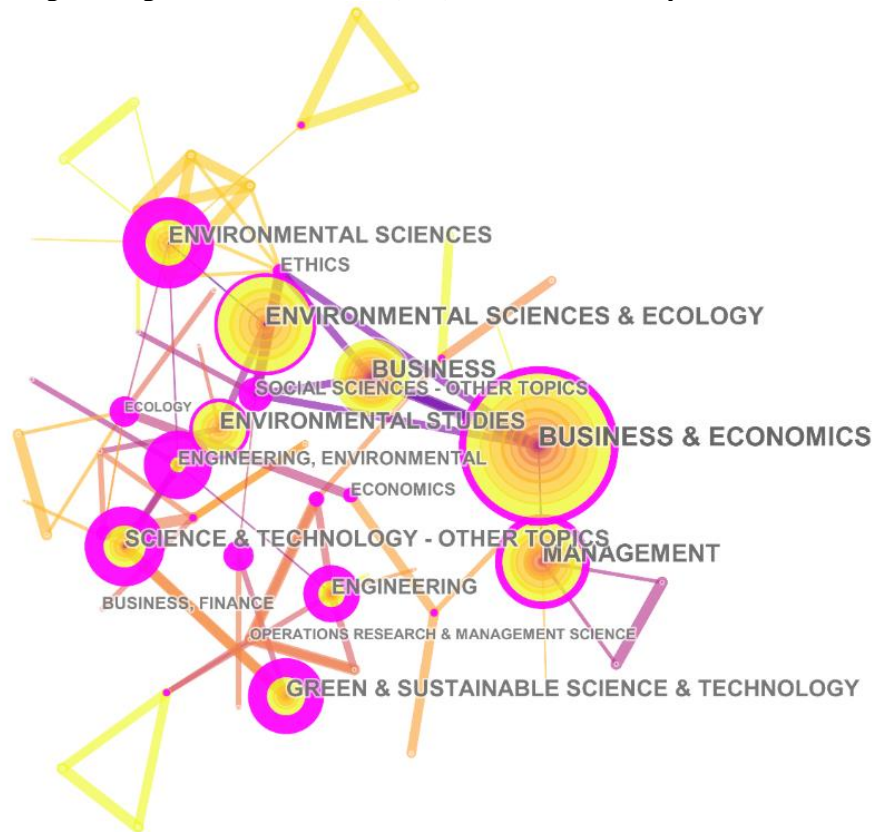

Figure 2. Subject category co-occurrence network
*Source:* processed primary data

Figure 3. Top 20 research areas of environmental issues and social responsibility
Source: processed primary data

3.1.2 Keyword co-occurrence network and burstiness

Figure 4 shows the keyword co-occurrence network of this research field and it consists of 199 nodes and 1638 links. The size of the node is proportional to the frequency of keyword occurrence. The top 15 keywords with frequency were corporate social responsibility (frequency = 643), strategy (frequency = 457), management (frequency = 401), performance (frequency = 315), sustainability (frequency = 311), social responsibility (frequency = 211), financial performance (frequency = 203), impact (frequency = 188), csr (frequency = 174), environmental management (frequency = 160), green (frequency = 156), resource based view (frequency = 121), perspective (frequency = 119), firm (frequency = 116), and supply chain management (frequency = 113), respectively. It is important to mention that corporate social responsibility and CSR is the same in which many scholars are studying on it, social responsibility ranked sixth since the responsibility should not be only from corporates perspective. The burstiness demonstrates the most significant research area and the number of citations increased rapidly over a short period of time (Zhao et al., 2019). Totally 30 keywords with the strongest citation bursts were detected. The top five most strengthen keywords are stakeholder management (burst strength = 6.36, 2010-2014), issue (burst strength = 6.21, 2009-2012), perspective (burst strength = 5.74, 2017-2018), ethics (burst strength = 4.99, 2009-2015), and economic performance (burst strength = 4.79, 2013-2015), with the period of its emergence. From 2017 to 2020, environmental disclosure (burst strength = 3.13), CSR (burst strength = 4.31), stakeholder engagement (burst strength = 3.81), institutional theory (burst strength = 3.30), and reputation (burst strength = 3.06) illustrate that during these period scholars were paying more attention on them.

Figure 4. Keyword co-occurrence network
Source: processed primary data

3.2 Co-citation analysis

Co-citation analysis is defined as the frequency with which two articles are cited simultaneously in another article (Edge, 1979; Small, 1973; Vanraan, 1990). In this section, the document, author, and journal co-citation network will be applied together with the clustering analysis. According to 1,336 records from the processed primary data from 2001 to 2020, accurate visualization of each network is shown in the corresponding section.

3.2.1 Document co-citation network

Figure 5 shows the landscape view of the document co-citation network and clusters. It consisted of 341 nodes and 432 links between 2001 and 2020. The labels of a cluster are presented depending on the cluster size. The weighting algorithm is following the log-likelihood ratio (LLR) to ensure the precision of clustering. It is essential to mention that the modularity Q is equal to 0.7607 (Q > 0.3), which is relatively high. It means that these clusters are justified by being divided into loosely coupled clusters (He et al., 2017), since there are a lot of small clusters as a result of the mean silhouette, which is a relatively low value equal to 0.5098 (ms > 0.7) (Wang et al., 2018). The module's color represents the corresponding average year of the study co-citation of each cluster, and the label color corresponds to the module color. The indicator of the color map is illustrated in Figure 6.

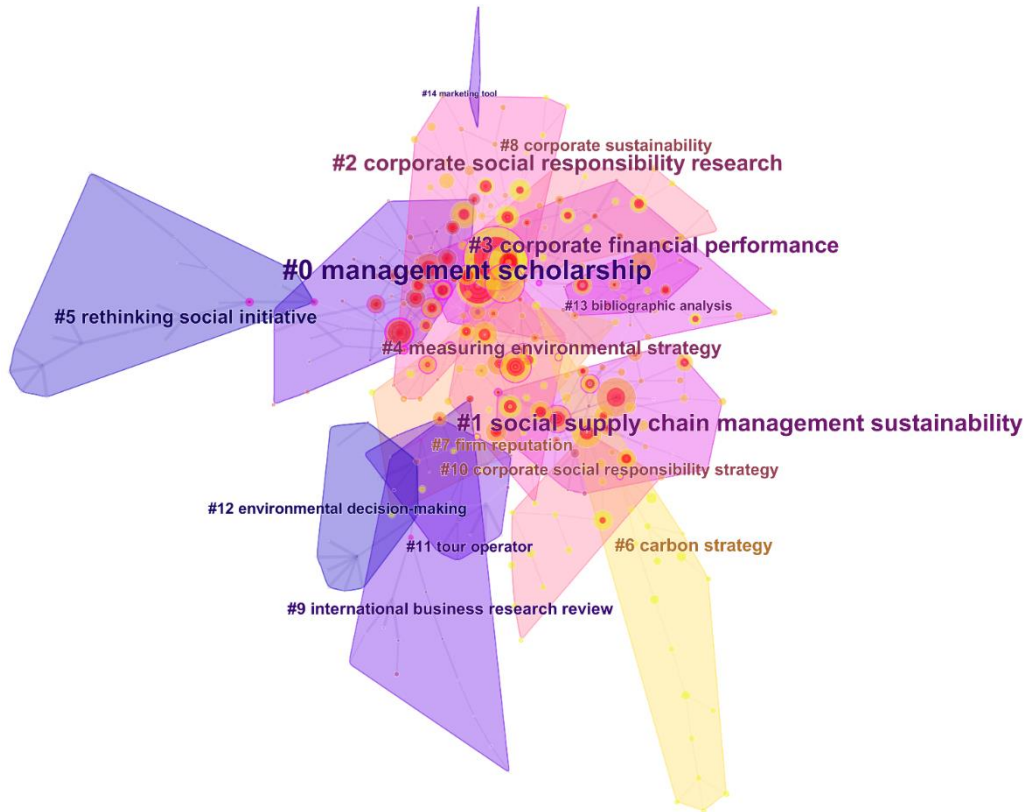
Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810


Figure 5. Document co-citation network and clusters
Source: processed primary data

Figure 6. The indicator of the color map
Source: processed primary data

There are a total of 14 clusters in this study, and the size of clusters depends on the number of papers. For instance, in Table 1, cluster#0 is the largest cluster, with the silhouette value of 0.791, which is lower than a smaller cluster, yet it is also considered as a high degree of homogeneity (Chaomei, 2017). The mean year represents the average publish year for a cluster, which illustrates whether the cluster contains older or more recent documents. For cluster #1, #2, #3, and #4, the mean year is around 2010, the mean year of cluster #0 and #5 is 2004 and 1998, respectively. More importantly, cluster #6 with the mean year in 2015 and a high silhouette value of 0.934 means the high consistency of studies, and the representative papers are essential for the cluster, and the most frequent co-citation is the representative literature.

Table 1. Top 7 co-citation clusters of environmental issues and social responsibility

Cluster ID	Size	Silhouette	Mean (Year)	Custer Label	Representative Literature
#0	45	0.791	2004	management scholarship	Porter and Kramer (2006)
#1	35	0.827	2008	social supply chain management sustainability	Seuring and Müller (2008)
#2	31	0.856	2010	CSR research	Surroca et al. (2010)
#3	30	0.72	2008	corporate financial performance	Orlitzky et al. (2011)
#4	23	0.774	2009	measuring environmental strategy	Aguinis and Glavas (2012)
#5	23	0.989	1998	rethinking social initiative	Hillman and Keim (2001)
#6	20	0.934	2015	carbon strategy	Shaukat et al. (2016)

Source: processed primary data

Cluster #0 'management scholarship' consists of 45 papers. Porter and Kramer (2006) proposed a new perspective on the relationship between business and society using a zero-sum game to analyze corporate success and social welfare. Bansal (2005) illustrated that corporates' sustainable development has a relationship between resource-based and institutional factors. The media pressure is important in the early stage, even though opportunities from the resources still existed over time, but this may depend on the corporate characteristics. Orlitzky et al. (2003) illustrated the relationship between corporate social/environmental performance and corporate financial performance and shows that performed social responsibility and little extend of environmental responsibility could increase more performance.

Cluster #1 'social supply chain management sustainability' Seuring & Müller (2008) reviewed papers on the topic of sustainable supply chain management from 1994 to 2007 and came up with two strategies on risk and performance of supplier management and sustainable project supply chain management. Moreover, the authors found out that little researches from the perspective of social aspects and sustainable development. Carter Craig and Rogers Dale (2008) introduced sustainable development into supply chain management, extended the concept of sustainability, and further strengthened this research field. Vachon and Klassen (2008) illustrated the environmental collaboration between upstream suppliers and downstream customers. The results have shown that processing performance will come closer with upstream suppliers, whereas product-based performance is more on the cooperation with downstream customers (Husaini et al., 2020).

Cluster #2 and #3, 'CSR research' and 'corporate financial performance,' Cheng et al. (2014) illustrated the CSR strategy would cause better access to finance. The result has shown that stakeholder participation and transparency of CSR were a benefit for corporate capital constraints, and further examined relationships driven from the social and environmental dimensions. Surroca et al. (2010) demonstrated no direct relationship between corporate responsibility and financial performance but formed an indirect relationship with a mediator of intangible resources, Rudyanto & Pirzada (2020). Carroll & Shabana (2010) presented CSR's business cases and how the corporate gained benefit from policies, activities, and practices. Orlitzky et al. (2011) illustrated the importance of strategic CSR and environmental sustainability, and Gimenez et al. (2012) examined the relationship between environmental programmers and social practices and the triple bottom line (environmental, social, and economic performance).

Cluster #5 'rethinking social initiative' Hillman & Keim (2001) demonstrated the shareholder value, stakeholder management, and social problem participation, and revealed that establishment of a better relationship with

stakeholders would assist corporates to explore intangible and tangible assets, and McWilliams & Siegel (2000) demonstrated the relationship between CSR to the financial performance from positive, negative, and neutral aspects, and the results showed that the relationship was neutral.

Cluster #4 and #6 'measure environmental strategy' and 'carbon strategy. Aguinis & Glavas (2012) reviewed 588 articles and 102 books with a comprehensive CSR analysis from the potential mechanism micro-based view. Darnall et al. (2010) proposed a sized moderated stakeholder model to contribute to stakeholder theory. The result showed that small-sized corporations were more sensitive to the value chain, internal regulation, and stakeholder pressures. It also illustrated the stakeholder pressure, and environmental strategies were modified according to the company size. Aguinis and Glavas (2012) illustrated that the more intention of social responsibility from the board, the more environmental and social performance are. Besides, this phenomenon was endogenous and self-reinforcing, which means that the difference between leaders increased, and it was also called competitive advantage. Liao et al. (2015) proposed suggestions on improving corporate governance and climate change strategies from the board and environmental committees. Helfaya & Moussa (2017) illustrated the relationship between the broad CSR strategy and the quantity and quality of environmental sustainability disclosure from the evidence of the UK. The result showed that it was critical of the broad CSR strategy for the stakeholder's legitimacy and accountability.

The top 20 papers with the highest citation, first author's name, and publication year are shown in Table 2. After reviewing these top 20 citation articles, the research fields included the review of corporate social responsibility (CSR) (No. 1, 12), the competitive advantage of nations and CSR (No. 2, 6), CSR works and affects the financial performance (No. 4, 5, 18, 19), the resource-based view of corporate (No. 11), stakeholder and environmental strategy (No. 7, 10), corporate sustainability (No. 13, 14, 15), sustainable supply chain management and social responsibility (No. 3, 9, 20), and the relationship between either stakeholder, financial performance, and environmental issues (No. 7, 8, 16, 17).

Table 2. Top 20 articles with highest citation on environmental issues and social responsibility

No.	Cite	Articles	No.	Cite	Articles
1	78	Aguinis and Glavas (2012)	11	33	Hart (1995)
2	54	Porter (2011)	12	33	Archie B Carroll and Shabana (2010)
3	50	Seuring and Müller (2008)	13	33	Bansal (2005)
4	48	Cheng et al. (2014)	14	29	Eccles et al. (2014)
5	48	Surroca et al. (2010)	15	28	Stefan and Paul (2008)
6	40	Porter and Kramer (2006)	16	28	Dixon-Fowler et al. (2013)
7	39	Darnall et al. (2010)	17	28	Vachon and Klassen (2008)
8	34	Aragón-Correa et al. (2008)	18	28	Matten and Moon (2008)
9	34	Carter Craig and Rogers Dale (2008)	19	27	Flammer (2012, 2013)
10	34	Sarkis et al. (2010)	20	25	Carter Craig and Liane Easton (2011)

Source: processed primary data

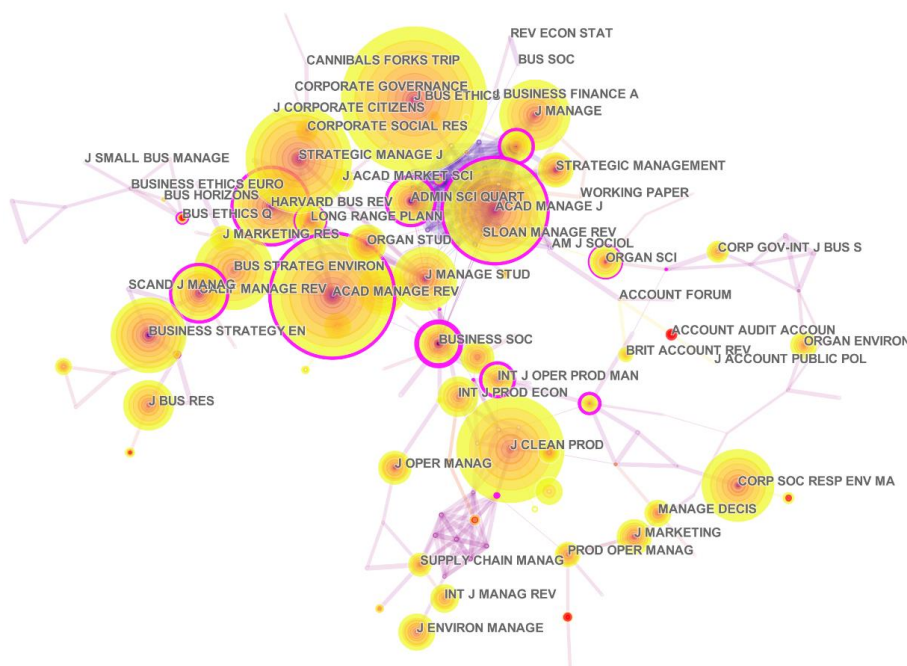
In addition, 144 burstiness articles were detected. The top seven articles are Porter & Kramer (2006) with a strength of 13.94, from 2010 to 2014, Bansal (2005) with a strength of 13.91, from 2007 to 2013, Orlitzky et al.

(2003) with strength 12.45, from 2007 to 2011, Seuring & Müller (2008) with strength 12.34, from 2012 to 2016, Sharma & Henriques (2005) with strength 11.52, from 2007 to 2012, Buysse & Verbeke (2003) with strength 11.40, from 2007 to 2011, Carroll & Shabana (2010) with strength 11.01, from 2016 to 2018.

Social responsibility and strategic CSR and environmental strategy are hot research fields since it is covered by cluster #0, #1, #4, #6. Hence, four research topics could be identified: sustainable supply chain management with social responsibility (cluster #0, #1), environmental carbon strategy (cluster #4, #6), CSR with stakeholder engagement and corporate financial performance (cluster #2, #3, #5).

3.2.2 Author co-citation network

This section illustrates the number of times the author was cited. As shown in Figure 7, this network consists of 254 nodes and 413 links, reflecting the indirect partnership formed by common references. Therefore, the top five citation authors are: Michael E. Porter (f = 432, UK), Stuart L Hart (f = 342, USA), Pratima (Tima) Bansal (f = 302, Canada), Sanjay Sharma (f = 282, USA), and Abagail McWilliams (f = 243, USA). Those authors' nationalities illustrated that articles on social responsibility and environmental issues areas had received widespread attention in the US, the UK, and Canada.
Figure 7. Author co-citation network
Source: processed primary data

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810


3.2.3 Journal co-citation network

There are 184 various journals in Figure 8, revealing that research on social responsibility and environmental issues covers various fields. The nodes' large size means more co-citation frequency, and nodes with purple color edges represent the journal's centrality. A journal with high centrality shows the importance of that journal, and articles from that journal cover a wider span. Table 3 shows the top 10 co-citation journals and the percentage of co-citation frequency among total co-citation frequency. Additionally, we found 55 burst journals. Those articles from these journals have received a large amount of attention in a short period. The top five are: Journal of Environmental Economics and Management (burst = 24.36, 2003 to 2015), Social Responsibility Journal (burst = 20.42, 2018 to 2020, UK), British Journal of Management (burst = 20.33, 2013 to 2017), Accounting, Auditing & Accountability Journal (burst = 17.81, 2016 to 2020), and Journal of Economic Perspectives (burst = 17.41, 2008 to 2014).

Table 3. Top 10 journals with highest co-citation frequency

No.	Co-citation frequency	Journal Name	Percent (%)
1	951	J BUS ETHICS	5.5%
2	801	ACAD MANAGE REV	4.7%
3	708	STRATEGIC MANAGE J	4.1%
4	707	J CLEAN PROD	4.1%
5	694	ACAD MANAGE J	4.0%
6	539	BUS STRATEG ENVIRON	3.1%
7	506	HARVARD BUS REV	2.9%
8	503	BUSINESS STRATEGY EN	2.9%
9	484	J MANAGE	2.8%
10	458	J MANAGE STUD	2.7%

Conclusions

Based on 1,336 records related to environmental issues and social responsibility through subject category co-occurrence analysis, keyword co-occurrence, author, journal, and document co-citation analysis, this study analyzed the current situation and development trend of this field. The emergence of environmental issues has brought a series of research problems and substantive problems to experts, scholars, and even entrepreneurs. With the development of the economy and the increasingly severe environmental issues, maintaining a relatively balanced growth in this ecosystem has become a hot topic. According to the finding from this research, we articulate that the research field of environmental issues and social responsibility maintain a hot topic and is continually emerging. Meanwhile, research related to social responsibility has been catching significant attention from academia and empirical practice.

Firstly, several research subjects related to business & economics, environmental sciences & ecology, management, business, environmental studies, and science & technology acquired the most documentation. Secondly, through the keyword co-occurrence network and burstiness analysis, and through the analysis of co-occurrence and emergence of keywords, this research has found a shift in the research paradigm in this field, from focusing on a single level of environmental issues to emphasizing broad organizational strategies, and from an individual or even government-centric perspective to a wide range of organizations and stakeholders and even the entire ecological perspective. Besides, we found that a sustainable supply chain may assist in this balancing act, but much research is needed.

Make your research more visible, join the Twitter account of ENTREPRENEURSHIP AND SUSTAINABILITY ISSUES: @Entrepr69728810

Although we have the advantages of the assorted procedure described above, our research still has several challenges. Firstly, using the Web of Science database might lead to some missing points in the analysis. Scopus is another reliable database that is advised to use another database when improving this type of research in the future. Secondly, even though the 1,336 papers identified by co-occurrence analysis used Scientometric method to classify topics, the topic coverage of the identified papers may depend mainly on the authors' subjective judgment.

In future studies, there are three directions that we recommended. Firstly, the guide refers to stakeholder participation in environmental issues from a systematic viewpoint. Secondly, the direction on establishing a social-responsibility-based framework and embedded in supply chain management and sustainability. Thirdly, the direction of environmental strategy, from the meso view, is significant for corporates to estimating and planning the strategy under a particular context. The context could be either a country or a specific area. In addition, the most important and essential rule is legitimacy, followed by other social responsibility aspects to support local development and environmentally friendly equilibration. From the macro perspective, the system's improvement on social and environmental/ecology will promote economic development sustainability since the environment is not the only barrier of development. Therefore, institutional differences and mechanism gaps under diverse social circumstances and environmental contexts are worth exploring.
